THE DRUGGISTS CIRCULAR

A PRACTICAL JOURNAL OF PHAR-
MACY AND GENERAL BUSI-
NESS ORGAN FOR DRUGGISTS

VOLUME LV, 1911

NEW YORK :
THE DRUGGISTS CIRCULAR
100 WILLIAM STREET

I N D E X

Pages.	Issue.	Pages.	Issue.	Pages.	Issue.
1-58	January	235-286	May	459-546	September
59-118	February	287-333	June	547-618	October
119-178	March	339-398	July	619-678	November
179-234	April	399-458	August	679-734	December

- A** A. q. s. ad., meaning of 639
- Abi** 474
- Abortifacients**, sale of in New York 35
- Absorbine** 310
- Acacia**, estimation of 77
- Acetanilide**, delicate test for (Watson) 260
- poisoning** 561
- poisoning like nitrite poisoning** 248
- Achibromin** 302
- Achijodin** 302
- Acid**, acetic, of the market 517
- benzoic**, of the market 517
- boric**, detection of 248
- boric**, of the market 517
- boric**, moisture in 354
- carbolic**, see phenol.
- formic**, estimation of 692
- glucuronic**, reaction for 472
- hydrofluoric**, determining the strength of 475
- lactic**, assay of 299
- lactic**, of the market 518
- nitric**, determination of 692
- nitric**, estimation of, in water 561
- oleic**, of the market 518
- oxalic**, preparation of 694
- phosphoric**, of the market 518
- picric**, stains, removal of 304
- racemic**, reaction of with barium, strontium and calcium 692
- salicylic**, of the market 518
- salicylic plus sodium bicarbonate** 571
- sulphamido-benzoic** 705
- sulphuric**, concentrated, preparing 565
- tannic**, of the market 518
- tartaric**, lead in 249
- tartaric**, of the market 518
- Acids**, fatty, separating solid and liquid 76
- goggles** for those who handle 22
- Aconite** root of the market 518
- poisoning** 75
- Adhesives**, formulas for 256
- Adipol** 194
- Adralgin** chirurgicum 352
- dentale** 414
- Adrenalin** with alkaloidal salts 310
- patents** valid 328
- and strychnine**, antagonism between 249
- Adrenaline**, some color reactions of 75
- Ads**, some, we don't see every day 452
- Adulteration** of buchu and other drugs (Mansfield) 240
- Advertisements**, filing, for reference (Rowe) 403
- Advertisers'** Protective Association and the lay press 401
- Advertising** campaign (Rowe) 556
- deceptive**, and beauty hints 122, 182
- does pay?** (Lauriston) 539
- Advertising**, that hackneyed old subject 621
- a line of** homemade toilet specialties 613
- in newspapers** (Hiscox) 452
- reform in** 126
- for retail druggists** (Gould) 42, 94, 154, 215, 270, 316, 376, 449, 537, 609, 670, 725
- Aethyloform** 474
- After-shave** 703
- Agarase** 250
- Agarophen** 352
- Air**, superheated, in skin diseases 350
- Alabama** association meeting 326
- board**, see Boards.
- board** questions 575
- Alacan**, José P., portrait of 497
- Alasch** 259
- Albucol**, inquiry about 35
- Albumin**, Heller's test for, improvement in 297
- tests**, how to observe in making 297
- Albumozo** 250
- Alcohol** denatured with wood naphtha, injurious effects of 473
- detection of**, in presence of acetone 636
- determination of**, the percentage of, in tinctures 195
- ethyl and methyl**, to distinguish 476
- formaldehyde in** 132
- of the market** 518
- percentage means absolute alcohol** 354
- wood**, blindness, electricity in 637
- wood**, a daily newspaper on the crime of selling as whisky 370
- wood**, dangerous, teaching as to 7
- wood**, dangers of 314, 468, 473
- wood**, death from 49, 240, 269
- wood**, labeling 592
- wood**, see also wood alcohol.
- Alcoholism** and tuberculosis 191
- Alcola** 26
- Alkaline** antiseptic with hydrogen dioxide 138
- antiseptic** solution 414
- Alkola** tablets 103
- Allen's** red tame cherry misbranded 682
- Almanacs**, nostrum 302
- Almonds**, milk of 571
- Almozoin** 518
- Aloes** of the market 636
- Aloins**, action of nitric acid on 602
- Alpers**, W. C., portrait of 475
- Alstonia** scholaris 477
- Aluminum** acetate solution, notes on 41
- to blacken** 350
- hydroxide**, precipitation of 193
- and iron**, separation of 28
- paint** 250
- Alpyinoids** 414
- Ambrosan** 285
- Amend**, B. G., death of 603
- portrait of** 106
- American** Chemical Society election 431
- Chemical** Society meeting 193
- American** Conference of Pharmaceutical Faculties 525
- Medical** Association 530
- Medical** Association election contested 96
- Medico-Political** Reform League 93
- American** Pharmaceutical Association:
- Approaching** meeting of the 380, 399, 432
- Attacks** on the 212
- Drug** reform and the (Sayre) 66
- Election** 53
- How** nominations for office in the, are made 182
- Journal** of the, established 522
- Membership** in the, in some far Western States 623
- Meeting** of the 459, 492
- Meeting**, papers wanted for 279
- New** blood in the 59
- Proceedings** of the, index to 402
- The** sick 64
- Time** wasted at meetings of 460, 578, 710
- American** Pharmaceutical Association branches:
- Baltimore** 107, 222, 322, 657
- Chicago** 107, 222, 277, 323
- Nashville** 53, 323, 657, 713
- New** England 107
- New** York 54, 108, 166, 222, 277, 323, 657, 713
- Northern** Ohio 54, 166, 223, 278
- Philadelphia** 108, 166, 223, 324, 657
- Philadelphia** (Scientific Section) 166
- Pittsburgh** 54, 166
- Washington** 54, 109, 167, 223, 278, 325, 713
- Amidoazotoluene** dusting powder 194
- Amigrin** 194
- Ammonia**, anisated solution of 305
- aromatic** spirit of (Egan) 690
- cloudy** 557
- water**, to decolorize 135
- Ammonium** carbonate of the market 518
- hypophosphite** syrup 688
- Amsterdam**, Peter, on the board college question 491
- Anæsthol** 302
- Analgesic** balm, Bengué 699
- Anderson**, W. C., and wife, snap shot of 526
- Anesthetics**, comparative dangers of 191
- Angostura** bitters 307
- Anilin** gentian-violet 248
- Anisated** solution of ammonia 305
- Anise**, oil of the market 518
- spirit**, weak 528
- Anonymous** correspondence, some 372
- queries** 142, 206, 359, 574, 706
- Ant** exterminator 359
- Anthrax**, laboratory, fatal 559
- Anticollum** 474
- Antidolorin** 528
- Antifellin** 474
- Antikamnia** case taken up on appeal 45
- Antimony**, arsenic, and tin, estimation of 193
- Antimony**, colorimetric determination of 469
- Antinarcotic** notes 714
- Antipyreticum** Rayman 134
- Antirachit** 78
- Antirheumal** 78
- Antiseptic** millenium, an (verses) (Ravenscroft) 666
- pepsin** solution 687
- Antitherpin** 563
- Antiverminzaepfchen** 352
- Antodyne** 78, 663
- Aphasia**, humorous story concerning 129
- Apiol** of the market 518
- Apomorphine** hydrochloride of the market 518
- Aponal** 638
- Apple**, F. M., portrait of 504
- Apples**, artificial, for jugglers' use 645
- Arboretum**, Lloyd 685
- Arbutin**, detection of by mic ro-sublimation 694
- true** 193
- Argentine** Republic, declaration of drugs imported into 167
- Arizona** association organized 51
- Arkansas** association 434
- board**, see Boards.
- legislation** proposed in 148
- Army** pharmacists, surgeon-general favors advancement for 711
- Arndt**, Paul, portrait of 605
- Arnica** tincture standard 517
- Arny**, H. V., portrait and sketch of 439
- Aromatic** elixir (Egan) 690
- perles** 258
- spirit** ammonia 250
- perles** 250
- Arsenanaemin** 474
- Arsen-butan** 302
- Arsenic** acid, detection of, in the presence of phosphoric acid 192
- antimony**, and tin, estimation of 193
- compounds**, various, toxicity of 247
- Arsen-regenerin** 302
- Ars. sol. pep.**, what is it? 700
- Art** of shopping, a burlesque 318
- Artificial** respiration 695
- Asafetida** of the market 518
- a** sophisticated 104
- Asfalath**, inquiry concerning 356, 359
- Asking** for what is wanted 418
- Asphyxia**, hypodermic injection of oxygen for 635
- Aspidum**, danger of 21
- Aspirin**, caution regarding 301
- making** a solution of 420
- poisoning** by 691
- solubility** of 518
- Association** meetings 123
- meetings** far less expensive 181
- meetings**, saving time at 460, 578, 710
- meetings**, State, papers at 288
- Associations**, Colleges, Societies, etc.:
- American** Chemical Society 106, 431
- American** Conference of Pharmaceutical Faculties 525

Associations, etc.:

American Medico-political Reform League	93
American Medical Association	96, 530
American Pharmaceutical Association (see separate head)	
Baltimore association	231
Baltimore exchange	233
Bloomington clerks	447
Boards, interstate	685
Boards, national	525
Boards, New England	57
Boards, Southern	109, 113, 337
Boston association	173
British Columbia association	437
British Pharmaceutical Conference	530
Brooklyn alumni	228
Brooklyn association	49, 111
Brooklyn college	334
Brooklyn conference	167, 228
Buffalo college	448
Canadian pharmaceutical	51, 163
Chicago association	52, 114, 232, 281, 531
Chicago club	527
Chicago veterans	441
Cleveland college	527
Cleveland Medico-Pharmaceutical section	172
Columbus (O.) association	281
Cumberland (Me.) association	599
Denver association	169
District of Columbia	326
East New York association	533
Fordham University	269, 660
Flavoring extract manufacturers	378
Grand Rapids club	527
Hartford clerks	51
Illinois University	527
International Congress of Pharmacy	225, 330
Kansas City association	281
Kentucky conference	441
Kings county society	49, 111, 164, 237, 280, 333, 606, 660, 715
Long Island Club	48, 113, 228
Louisville association	233
Luzerne county (Pa.) association	453
Manhattan association	47
Manufacturing perfumers' association	323
Massachusetts college	664
Meadeville (Pa.) association	229
Medico-Chirurgical college	50
Michigan retail association	666
Milwaukee association	173, 527
Milwaukee clerks	447
Minneapolis association	51, 173
Montgomery county (Pa.) association	173, 325, 533
National Association of Boards of Pharmacy	525
National Association of Pharmacologists	51, 109, 173, 431, 599
National Association of Retail Druggists (see separate head)	
National Civic Federation	440, 655
National Pharmaceutical Society	113, 228
National Wholesale Druggists' Association	656
New Brunswick association	437
New Orleans clerks	599
New Orleans college	55
New York alumni	47, 48, 110, 165
New York college	48, 113, 165, 280, 285, 338, 439, 715
New York conference	227

Associations, etc.:

New York county society	440, 661
New York chapter P. C. P. A.	384
New York chemists' club	48, 228
New York German society	47, 113, 165, 228, 280, 329, 384, 440, 533, 601, 606, 659, 660, 715
New York retail association	329, 384, 606
Northwestern University	173, 233, 527, 607
Nova Scotia association	437
Ohio Valley association	172, 527, 655
Opium conference	115
Philadelphia association	114, 169, 281, 441, 533, 662, 722
Philadelphia alumni	533
Philadelphia alumni in New York	384
Philadelphia college	170, 229, 280, 338, 384, 661, 662
Philadelphia exchange	169
Prince Edward Island association	437
Proprietary association	329
Racine clerks	233, 447
Rhode Island alumni	599
Rochester association	173
Saskatchewan association	437
St. Louis association	173, 225
Society of Chemical Industry	530
State pharmaceutical (see Pharmaceutical)	
Terre Haute clerks	447
Vigo county (Ind.) association	173
Utica association	599
Wedgewood club (Baltimore)	51
Wedgewood Club (Brooklyn)	167
Westchester county association	112, 279, 660
Women's association, Pacific Coast	713
Women's organization, N. A. R. D.	231, 599
Youngstown (O.) association	232
(See also Boards, Colleges.)	
Asthma, best cure for	27
Atlanta and soda water	98
Atomic weights, international, for 1912	659
Atomizer, oil, improvizing	568
Atoxyl	474
Atoxyl, blindness from	191
identification of	694
sterilization of solutions of	475
Atrophin	250
Atrophin, detecting	560
in oil	201
Attfield, John, death of	233
Atwood's vegetable jaundice bitters	528, 646
Austria, dispensing fees in	163
Avantol	250
Az-ma-syde misbranded	104
BACTERIA , counting with the ultra-microscope	470
Bacteria, staining fluids for	303
Bacterins autogenous	205
Baird, J. W., death of	398, 448
Bakers and saliva	261
Baking powder	701
powders, poisonous metals in	422
Balluff, Paul, portrait of	603
Balm, analgesic, Bengué	699
Balmwort, fluid, and the food and drugs act	161
Balsam peru of the market	518
tolu and creosote in pills	141
Baltimore, soda water in	98, 159, 274
Baltzly, A. B., death of	285
Banana flour as an infant food	24

Banana liquid for bronzing	28
Bananen kakao, Stanley	474
Bananin	474
Bandoline	261
Bank, standing in with the	668
Bardet's serum	352, 695
Bargain sales methods	540
Barium, reaction of with racemic acid	692
strontium and calcium, separation of	562
Barrie, Billie: Building up a business in photographic goods	291
Three timely times	731
Barrot	474
Basham's mixture making and dispensing	568, 643
Bathroom, the, as a drug store (McCardell)	333
Bauer & Black misrepresented	232
Baumé degrees	702
Bay rum (Gordon)	183, 358
rum coloring	33
rum essence	79
rum making	82, 141, 200
Beal, J. H.: Devises a cheap still	515
And the North Carolina association	533
Portrait of	497
Resigns from the Pittsburgh college	714
Bean, J. A., portrait of	584
Beauty, the cost of	607
Becco acid	474
Beck's bismuth paste	135
Bed bugs	136, 260, 417
Bedstead, painted, poisoning from a	213
Beer consumed in this country	443
determination of lead in	298
Beef and yeast extracts, differentiating	627
Belladonna, characteristics of fresh and dry	469
culture in the United States	515
false influence of soil on the growth of	413
leaf of the market	518
root, some sophisticated	45
Bendiner, S. J., portrait of	604
Benson, Smith & Co., Honolulu	551
Benzcalin	302
Benzene in gasoline, to detect	473
Benzin ignited by friction	206
Benzoic acid, detection of in butter	299
Benzoin of the market	518
Benzol benzoate	308
poisoning	23, 473
Benzyl benzoate	308
Berger, E., portrait of	504
Beringer, G. M.: On standards for unofficial drugs	91
Portrait of	513
Berkowitz, M. E.: Cresol and its compound solution	419
Berry, B. O., on the board college question	480
Bettes' store at Jacksonville	379
Betulol	699
Biersach, Adolph: Solving the fly problem	149
Bigelow, W. D., and the bureau of chemistry	429, 548
Bijou cleaning fluid	28
Bilatin	563
Bile in gastric contents, test for	190
Bilifer-Gelodurat Stärke I.	134
Bilirubin, test for	190
Bilz nachrsalz	414
Biocitin	414
Biofaex-pillen	352
Biohydron, Coleman	696
Biolactyl	696
Biosine le Perdiel	696
Bird lime	476
Biroth, Henry, portrait of	494

Bismuth benzoate	23
gauze	206
paste, Beck's	135
subnitrate in an acid mixture	703
subnitrate paste, poisoning from	300
sallylate, detection of subnitrate in	351
sallylate of the market	518
subnitrate, estimation of nitric acid in	297
as a possible tenicide	75, 569
Bitters, angostura	307
Blackberry cordial, a misbranded	103
Bladder wrack as a fat-tener	41
Blair's pills	567
Blasen- und nieren-tee	414
Blasenkatarrh-tee	414
Blaudiol	696
Blindness from atoxyl	191
from wood alcohol, electricity in	637
Blistering liquid	574
Blizzard class will dine	113
Blodgett extract	252
Blood tests	130
Blue, laundry	491, 534
methylen, as an indicator	292
methylen, stains of	309
Boards of health, pharmacists as members of	119
Boards of Pharmacy: Associations: Interstate	665
National	626
New England	57
Southern	109, 113, 337
Candidates, college graduates as	233, 313, 360, 400, 425, 487, 550, 576, 578, 632, 650, 653
Emanuel, Louis, on	578
Examinations, see Examinations	
Fischelis, Robert P., on	650
Poster, James, on	653
West Point candidates compared with	632
Meetings: Alabama	56, 230, 395, 717

THE DRUGGISTS CIRCULAR

A Practical Journal of Pharmacy and General Business Organ for Druggists

VOL. LV. NUMBER 1

NEW YORK, JANUARY, 1911.

WHOLE NUMBER 649.

Happy New Year.

Another Christmas has come and gone and another New Year is before us. We trust that each of our readers has spent the holiday season happily, and that the twelvemonth upon which he is just entering holds much in store for him that will make him even more happy when another Christmas rolls 'round—as it is sure to do, and with a speed which will seem remarkable to many. The columns of figures on the two sides of the ledger have been added, and in most cases we believe the totals show that 1910 was a good year for business.

Distressing though the thought may be, it is true that there are always some who have been unfortunate in business, whose personal affairs are not in a shape which conduces to happiness, to whom the future looks anything but roseate. If they could not join whole-heartedly in the happiness which so pervaded the atmosphere during the Christmas season, they could at least find some consolation in the fact that things might have been worse than they were. May these be able to begin the year with a determination to get out of it the best there is in it for them, and may success crown their efforts.

We want the successful and the unsuccessful, the happy and the unhappy, the gay and the sad ever to remember that this is a good old world to live in, and that there is always an opportunity for each of us to make it better by making himself better, and to enter upon the work before them with the determination to get happiness *out* of it by putting their hearts *into* it. Let us not rail at the inevitable, let us strive to be philosophic, let us be successful and happy, happy and successful, each because of the other. Much of what a man is, depends upon the condition of his mind—there is something in Christian science beside foolishness, even though many consider that its leading characteristic. A man whose conscience is clear, and whose dealings with his fellow man is marked by justice and tempered by a spirit of tolerance should never be unhappy, and his life can never be wholly a failure, no matter how much or how little his administrator may find to distribute.

As heretofore, THE DRUGGISTS CIRCULAR will do what it can during the year now upon us, to advance the interests of its readers professionally, to aid them in their pharmaceutical work, and to make their commercial outlook clearer.

Here, then, is wishing all our readers a Happy New Year.

Retrospect of a Decade.

It seems to some of us older ones not much longer ago than last year, or a year before that at most, that the phrase *fin de siècle* (pronounced in all sorts of ways) was on everyone's lips and in every paper or journal one could pick up. As a matter of fact, however, the expression belongs to a past century, and we are now entering upon the second decade of the present one. A favorite occupation for the New Year moments which one devotes to reflection is looking back over the old year and noting the changes it has wrought; and at the beginning of each year whose number ends with the figure one it may be worth while to take a view extending backward over the old decade.

Since the beginning of the last such year many things have taken place which bulk large in the making of pharmaceutical and drug-trade history; so many things, in fact, and so important, that one is almost at a loss to know which should be named and which allowed to fall under the head of matters that are necessarily left unmentioned for lack of space. Of course no American druggist can contemplate changes which have taken place in his line of business during the tenth of a century just ended, without giving more than a passing thought to the passage of the federal food and drugs act and the many State acts based upon it. This is not only the greatest thing in drug annals during the past ten years, but it marks one of the most important advances made in the history of the country. Other things worthy of especial consideration in this connection are the higher educational attainments required of those who secure license to practice pharmacy, the convention for revising the Pharmacopœia, the growth of the chain-store idea, the rise and collapse of the "tripartite plan" for controlling the prices of proprietary goods, the passage of pharmacy laws for those few States and Territories which were without them ten years ago, the renascence of the American Pharmaceutical Association and the formation under its protective wing of the National Association of Boards of Pharmacy and the American Conference of Pharmaceutical Faculties, the awakening of the more enlightened portion of the lay press to its duty toward its readers in the matter of fraudulent nostrums, the establishment of the council on pharmacy and chemistry of the American Medical Association, and the joining of the *Journal* of that association with the CIRCULAR in the latter's efforts to show medical men and pharmacists how they to a large extent have abandoned

York, one of the oldest members of the American Pharmaceutical Association; John Wyeth, of Philadelphia, druggist and manufacturer; J. W. Champion, of Philadelphia, originator of the "Champion plan" to prevent price-cutting; J. C. Eliel, of Minneapolis, a retail druggist who afterward made a success as a wholesaler; and C. V. Emich, the Nestor of the Baltimore retail drug trade.

1908—Arthur Timberlake, of Indianapolis, prominent in local affairs as well as in the councils of the National Association of Retail Druggists; Thomas Lord, of Chicago, first a retailer then a wholesaler; Henry Imhof, a former president of the New York German Apothecaries' Society; Dr. J. A. Miller, of Harrisburg, secretary of the Pennsylvania Pharmaceutical Association from its organization in 1878 to the time of his death; L. Myers Conner, first president of the Texas Pharmaceutical Association; William Dupont, an old time druggist and active association man of Detroit; F. A. Davidson, president of the Theodore Metcalf corporation, of Boston; E. F. L. Jenner, of Derby, N. S., president of the Nova Scotia Pharmaceutical Society, and, under the pen name "Thercites Mendax," a writer of exceedingly interesting contributions to the pharmaceutical press.

1909—W. M. Searby, of San Francisco, the leading spirit in pharmaceutical organization, teaching and writing on the Pacific Coast, and a former president of the American Pharmaceutical Association; A. P. Sharp, whose retail store at Baltimore was the beginning of Sharp & Dohme's immense business; George J. Seabury, of New York, a successful manufacturer and prominent association man and writer; G. G. C. Simms, of Washington, for a long time prominently identified with pharmacy at the capital, and a former president of the National College of Pharmacy; J. B. Moore, of Philadelphia, a successful retired pharmacist and contributor to the pharmaceutical press; William Jauncey, a leader in the affairs of the Chicago Veteran Druggists' Association; J. H. Redsecker, of Lebanon, a former president of the Pennsylvania Pharmaceutical Association; T. S. Wiegand, librarian of the Philadelphia College of Pharmacy; Dr. Susan Hayhurst, of Philadelphia, the first woman (1883) graduated by the Philadelphia College of Pharmacy; W. J. M. Gordon, of Cincinnati, first a retailer and then a manufacturer, and a former president of the American Pharmaceutical Association; C. H. Gaus, of Albany, first secretary of the New York State Pharmaceutical Association, three times mayor of Albany, and at the time of his death State controller; and C. O. Rano, of Buffalo, a former president of the New York State Pharmaceutical Association, and secretary of the Erie County Board of Pharmacy.

1910—C. S. N. Hallberg, of Chicago, teacher, writer, and association man; Louis Dohme, of Baltimore, once a drug clerk and at the time of his death president of Sharp & Dohme; P. C. Candidus, of Mobile, first president of the Alabama Pharmaceutical Association and president of the Alabama Board of Pharmacy from its creation in 1887 to his death, and

first honorary president of the American Pharmaceutical Association; J. W. Colcord, of Lynn, Mass., one of the organizers of the Massachusetts Pharmaceutical Association and of the National Retail Druggists' Association; A. Kiefer, first a retailer and then a wholesaler, and one of the organizers of the National Wholesale Druggists' Association; Robert W. Johnson, of New Brunswick, who left the retail business to gain fame and wealth as a manufacturer; E. W. Fitch, of Jeffersonville, Ind., a veteran who was for many years manager of the New York branch of Parke, Davis & Co.; and J. F. W. Meyer, of Fort Wayne, Ind., president of the Meyer Brothers Drug Company.

This list could be extended to a length which would preclude its publication here, but only a few names of the better known have been included in it.

The press, it might be noted in passing, has suffered severe losses in the death in 1902 of Dr. Frederick A. Castle, of New York, who for many years was editor of the *American Druggist* while Dr. Charles Rice was its associate editor; in 1904, of Dr. Frederick Hoffmann, a scholarly German who founded the New York *Pharmaceutische Rundschau*, and of Dr. Gustav Pfingsten, for a long time the capable and esteemed editor of the New York *Deutsch-Amerikanische Apotheker-Zeitung*; in 1906, of Charles E. Ward, of Denver, editor of the *Rocky Mountain Druggist*; in 1907, of Dr. Frank L. James, editor of the *National Druggist*, who was one of the most versatile scholars and accomplished writers that ever graced a drug journal sanctum; in 1909, of A. C. Wooton, a former editor of the London *Chemist and Druggist* and a profound student of pharmaceutical history, ancient as well as modern, and, in 1910, of Benjamin Lillard, founder of the *Practical Druggist*; and of Newlands Hayes, founder of the *Retail Druggist*. Prof. Ebert and Mr. Colcord had been editors, and Profs. Searby and Hallberg were cut down while still guiding the destinies of two pharmaceutical publications, but these four belonged to pharmacy at large rather than to any restricted field of pharmaceutical endeavor.

While this hurried retrospect is altogether inadequate, it has already exceeded the length to which its use here should have confined it. Of course, it is not offered as covering the ground, but is merely given to stimulate a little thought on the part of those who wish with us to study the marks of time.

Happiness in Daily Toil.

Great love and marked success go hand in hand—provided the love is for the thing that leads onward and upward. The chances are against the success in the drug business of a clerk who does not love that business; and the less such a one succeeds the less he will love the business. That man is poorly paid, no matter what his salary, who does not feel rewarded by seeing the growth, the amplification, the development of what he helps to create. Increasing trade as a result of his efforts is a source of pride to the

clerk who is destined to become a successful proprietor; a cleaner store, more attractive windows, improvement in the advertising, or a better kept-up stock is also a cause of gratification for him. The man who works solely for wages will probably never get any more than wages, while his fellow-clerk who works for love of the work will in time become the junior partner and "fire" his former co-laborer, if the "old man" has not already relieved him of this disagreeable task.

Can a mother be paid in coin for the tender care she gives to her child? Can such tender care as a mother gives to her child be purchased for mere wages? The answer to the two questions is the same and is obvious. While it is a far cry from maternity to commercialism, human nature is much the same in mothers and in business men, and while the love of the former for their offspring is the highest form of that passion, the business man, be he proprietor or clerk, who does not feel the quickening influence of some kind of love in his daily work is as much to be pitied as would be the mother who considered the attention she bestowed upon her child as simple drudgery. And the work of such a man probably fares about as badly as would the child of such a mother.

When a man applies for a position which requires a little more than that its occupant shall be "on the job" from eight to five or from seven to eleven, and the first question he asks is, What is the pay? he probably is not the best man for the place. He expects all his pay in money, and probably intends to do no more than just enough to get this pay. A drug clerk applied for a position in an office. A man to fill the position acceptably would have to put a good deal of himself into the work, which consisted of more than adding of figures or the copying of notes or other mere routine effort. He stated that he was receiving a certain salary as a clerk and could not afford to make a change unless he could "better himself." The man with the office position to be filled was offering less than the figure named by the clerk, and so dismissed him with polite regrets, remarking to an associate later that the clerk who was looking simply for the salary could not fill the position anyhow. The place was offered to another drug clerk. He, too, was receiving more than the salary named, but the work appealed to him and he undertook it. He "made good." His salary was increased from time to time and is now more than double that of the average drug clerk, in real money, to say nothing of the pay he gets in the shape of seeing his efforts produce something worth while. Of course such a man would have received that kind of pay even had he remained a drug clerk, but probably to not the same extent.

There is perhaps no truer saying current in business circles than "Get happiness out of your work or you will never know what happiness is." The multi-millionaires who stick to business do not do this because they need the money, but because they have found a game which they love, and they do not care to stop playing it.

STANDING BY A PRINCIPLE once cost an employee of Stephen Girard his job, according to a story which was current years ago. A young man in the employ of the great merchant was told to do certain work on the Sabbath. He replied he could not work on that day, as it was against his religious principles. Girard, who took little stock in the religion of the time, told the young man he would have to work on this particular Sunday or lose his place. The young man did not work on that particular Sunday or on any other one and so did lose his place. Some time afterward a friend of Girard's asked him if he could recommend some honest young fellow for a position of trust, and Girard recommended the young man who rather than sacrifice a principle had lost a position which he much needed. Whether the Girard story is true or not, and it is by no means an improbable one, the following we can vouch for: Not long ago a large manufacturing concern refused to accept some machinery it had ordered, on the ground that it was not up to specifications. The maker of the machinery insisted that the order had been filled properly, and demanded that he be paid. The large manufacturer detailed one of his mechanical engineers to go over the specifications and machinery to ascertain where the trouble lay. The engineer reported that the fault was in the specifications, which had been prepared in the office of the large manufacturer. "This report is no good to us," said his employer. "I am sorry," replied the engineer, "but you sent me to ascertain the facts, and here they are; if they are not what you want the blame certainly does not rest upon me." A short time thereafter the American rights to make certain machines in use abroad were offered to the large manufacturer at a price he was willing to pay, provided the machines would do what their owner claimed for them. He decided to send one of his own men over to examine the machines at work, see just how they were made and get copies of the drawings and specifications which would enable him to duplicate them. As a good deal of money was involved it was necessary that the man sent should be one who could not be "influenced" by the foreign manufacturer to make a more favorable report than the facts warranted. He sent the engineer who had made the other report mentioned. Sometimes a journal finds it necessary to take a stand on a question of principle which may seem at the time to some of its readers to be opposed to their interests. It may irritate them for the time being to see a journal which they help to support, expressing views which they consider contrary to their temporary welfare, but down in their hearts they feel a respect for that journal which would be utterly lacking were it to be guided by one policy this month, another next month, and a different one some other time. The man who has principles and lives up to them, even when he might turn an extra penny or two by making a slight sacrifice of the right, is the man who in the long run will have the respect and confidence of his neighbors, which, after all, are more valuable business assets for either a man or a journal than money made by means which preclude them.

THAT COLLEGES OF PHARMACY obtain money from students by false pretenses has been charged more than once, the reasoning being that the professors and others interested in colleges cause a high standard to be fixed for those who obtain license to engage in the drug business, so that they are compelled or almost

compelled to go to college in order to pass the examination to obtain such license, and then, when they are in business, find that they do not need what they were compelled to learn. The reasoning is faulty in many particulars, and will not hold at all, yet there is just enough truth in part of it to make it worth attention. If a man goes into the drug business as a mercantile pursuit, he does not need a great deal of what he had to learn at college or pass an examination on when he went before the board; and if he goes into pharmacy as a profession he will find that his college of pharmacy education—unless he was extremely fortunate in the selection of his college—is woefully inadequate to fit him for performing some of the bacteriological and other high-class work which physicians and the public may reasonably expect a “graduate,” or anyhow, a “doctor,” to do. While in this country a drug store and a pharmacy are supposed to be one and the same thing, in Europe they are very different things, and it has been prophesied that as the work of scientific pharmacy becomes more scientific and the business of commercial drug dealers becomes more commercial, a difference between drug stores and pharmacies will be established by law in this country. When that is done, and maybe before it is done, there will be a demand here, on the one hand, for colleges which will take young men and train them in what they should know to become druggists, and, on the other, colleges which will take A. B.’s and B. S.’s and after putting them through a course of study, turn them out as D. S. P.’s—doctors of science in pharmacy—who will take rank with the best of M. D.’s and Ph. D.’s as educated men and trained scientists. When this has come to pass, if it does come to pass, then the D. S. P.’s will work in bacterins, vaccines, antitoxins, and other materials used in preventive medicine, and will devote much of their time to physiological and other forms of organic chemistry, as well as to high-class prescription work, while the ordinary Ph. G. or Pharm. M. will mix and sell drugs under restrictions which will make him more of a merchant than a scientist. This is a word picture drawn from fancy, but, like the reasoning to which reference has just been made, may be worth a little attention.

EXPERT WITNESSES seem to have a limit beyond which even they refuse to go in their efforts to earn the large fees which they are popularly supposed to receive, partly for their services and partly as a balm for their wounded consciences. In commenting on a prosecution for the sale of rotten eggs in this city, one of the daily papers said: “A doctor of chemistry was introduced by the defense and questioned as to the wholesome and nutritious qualities of ‘spot’ eggs. Some headway was made along this line until the prosecuting lawyer put the question: ‘Then, Doctor, the gist of your testimony is that decomposed eggs are fit for food?’ ‘I will not answer that question,’ the Doctor replied, ‘I consider it insulting.’ Hereafter be it known that while experts may be got to testify that shoddy is all wool, that formaldehyde is innocuous, and that pestilential streams are pure, they draw the line at decomposed eggs and avert their noses. Let the prosecutions go on.” Delivering his presidential address to the American Pharmaceutical Association at its Richmond meeting last year, Dean Rusby, of the New York College of Pharmacy, himself an expert whose testimony is not for sale, but one who has had abundant opportunity to become well acquainted

with some of the other sort, said: “I believe that one of the most important considerations to which we can devote attention in this connection, especially at a meeting which is held upon the eve of the assembling of the pharmacopœial convention, is the growing tendency of scientific experts to sell their services as witnesses without regard to the merits of the case, or even the truth of the statements to which they are testifying. It is not a mere question of the commission of naked perjury; there are many ways of giving testimony outside of the witness stand. The real offense is the sacrifice of that sense of responsibility to the cause for which all scientific effort should ultimately be put forth, the establishment of absolute truth. It is deplorable that so great and general a laxity in this direction should have come to exist. . . . What is to be expected from the students of an institution who see the professor to whom they look for an example go upon the witness stand, and, for a fee, swear to the exact opposite of that which he has been teaching them as the truth in his instruction course?”

MEDICINE FAKERS seem to have fallen upon hard times. Between the food and drugs acts, the council on pharmacy and chemistry of the American Medical Association, those newspapers and magazines which refuse to be bound to silence by a “red-clause” in their advertising contracts, or even to accept at all advertisements of nostrums and systems which are fraudulent on their faces, the internal revenue bureau, which dealt a solar-plexus blow to the “tonics” whose chief sale was in prohibition territory, and the pharmaceutical journal which the medical swindlers honor by hating, the makers of fraudulent nostrums have been having an interesting time these past few years. The post-office department has now joined the crusaders in real good earnest. In a recent interview with a representative of the *New York Times*, Postmaster General Hitchcock is reported to have said: “We have landed some of them, I say, but we’re going to land more. And we’re not doing it by cutting them off from the privilege of using the mails, either. It’s going to be the penitentiary for all of them that we can prove our cases against. There is no more of the fraud order remedy for these swindlers. We’ll put them behind the bars. . . . If a man is convicted of using the mails to defraud, he will find that his mails for the next few years will be addressed to the warden of some penitentiary.” The postmaster general was talking about swindlers of the get-rich-quick, gold-miner-in-sky-scraper, fortunes-in-banana-raising kind, but he added: “The department is going after the fake ‘patent’-medicine people, too.” He might have added that the latter are the most despicable of the whole lot, as while the sellers of artistically-printed certificates of stock in worthless mines swindle the healthy, the “fake ‘patent’-medicine people,” as he calls them, swindle the sick and retard or prevent them from doing the one thing most likely to work a cure of their cases.

TO READ THE JOURNALS more thoroughly than ever before should be one New Year resolution of every clerk in the business. As text-books are necessary to the educational success of the student at college, so are the journals necessary to the commercial success of the student of business. In the former he learns that about pharmacy which his teachers require him to know before he may obtain his diploma, while in the latter he may read not only of the progress made in pharmacy, chemistry, materia medica,

and the allied branches of science since the text-books were written, but he may keep in touch with the best thought of the best men in the business regarding the successful conduct of a drug store. Let any clerk who reads this item take the copy of the CIRCULAR that is open before him, cast his eye over its various articles, classify the same under the various headings which he may select for them, and set down under these headings notes of the amount and probable value to him of what he finds in this issue, then multiply the result by twelve. If he does not at once resolve to be a more attentive reader of the journals than he has ever been before he has either been reading them as attentively as he can already, or is—almost—a hopeless case. If the proprietor does not preserve his journals in a neat and orderly shape, the clerk can “make a hit” in a quiet way by stringing them together from month to month, leaving the current issue loose, and at the end of the year binding them, using for this purpose a sheet of heavy manila paper, an awl, a large needle, and a bit of strong twine. Not only will the proprietor appreciate this little evidence of the clerk’s care, but the preserved journals will pay him for his trouble many times over during the year.

ONE CARDINAL POINT IN MERCHANDIZING seems to be overlooked quite frequently by those to whom it is of vital importance, and that is the fact that but for the customer there would be no business. The salesman who does not stop arranging stock or talking to his fellow salesman when a customer enters the store, and put his best services at once at that customer’s disposal, seems to forget that his salary is paid out of money left in the store by customers, and that if this money were not forthcoming he would have to seek a new position. The cashier who counts money while a customer is waiting to pay his check, to the annoyance of that customer, should remember that there would be no money to count should this customer and the others decide not to return. Writing orders for goods, putting the store into shape, dressing windows and lots of other things which salesmen do are very important, while discussing the base-ball game with each other or with loungers is somewhat less so, but no matter what the salesman may be doing he should always remember that if there were no customers he would not be in the store to perform the manifold duties which he oftentimes seems to think of more importance than pleasing the customer.

DISBARRING, as practiced by the legal profession, or its medical analogue, is advocated by one of the medical journals as a means of ridding the healing profession of some of its undesirables. “Unfrocking,” to use a word borrowed from the other of the “three learned professions,” is already practiced by pharmacists. Only a year or so ago a prominent pharmacist and ex-president of his State pharmaceutical association was deprived by the board of pharmacy of his State of his license to practice. His offense, if we remember correctly, was the illegal selling of cocaine. While this is a conspicuous example of pharmaceutical “disbarring,” the disbarring itself is by no means unusual when the provocation is present.

ONE KIND OF DRUGGIST “works” sick people; another kind works for sick people. The former strives to become a nostrum manufacturer on a large scale; while the latter is generally a highly-respected citizen and an ornament to the community in which he lives.

Dangerous Teaching as to Wood Alcohol.

An item was recently printed in one or more journals to the effect that a German physiologist concluded that methyl [wood] alcohol is “somewhat more poisonous than ethyl alcohol, but that pure methyl [wood] alcohol is not sufficiently poisonous to cause danger of injury from the vapor when used in various industries. The accidents which occur in such cases are caused, not by the methyl alcohol itself, but by the impurities which it contains.” This is a very dangerous teaching. It is well known that exposure to the vapor of wood alcohol has caused blindness, and that the purest wood alcohol so far obtainable commercially, has produced blindness and general systemic poisoning when ingested in small quantity, and it naturally carries the same risk to those exposed to its vapor. Knowing this, he would be a fool-hardy man who would experiment with any other supposed to be purer. Incidentally we refer to the suggestion which has been made by various persons that the name wood alcohol should be changed to something eliminating the “alcohol” part—say “wood naphtha,” for want of a better. Many people, probably most people, do not know that wood alcohol and grain alcohol (which latter has long been known simply as alcohol) differ so widely in their properties.

Keeping Solution of Hydrogen Dioxide,

Referring to solution of hydrogen dioxide, a bulletin of the Kentucky Agricultural Experiment Station says that it should “be kept in a dark closet, so that in case of an explosion taking place, there will be no danger from flying pieces of glass.”

The advice is bad, inasmuch as it implies that the solution is to be kept in tightly corked bottles. If it is so kept, in dark closets or elsewhere, it may explode when disturbed, or when the bottle is heated by the touch of a hand, and do damage.

The way to keep solution of hydrogen dioxide is in such manner that there will be no explosion; that is, not closely confined. Then, in case of liberation of much gas, no damage is done. There is no sense in tying the cork in a bottle of the solution; close confinement does not retard the separation of a portion of its oxygen, whereas, it is said that stopping the bottle containing it with a pledget of cotton does have this effect.

Estimation of Morphine by the Codex Process.

Mme. Marcelet and R. Marcelet (*Bull. Sci. Pharmacol. through Pharm. Journ.*) point out an anomaly in the process of estimating morphine in the crude opium and in the powdered substance, where the desiccation is effected at 60° and 40° respectively. In making practical observations they were surprised to find how slowly the water evaporated from the opium at the temperature of 60° indicated by the French Pharmacopœia. The summary of the results shows that the greater part of the water evaporates in the first twelve hours; after sixty hours, the loss of weight is very small; finally, the weight only becomes constant after 122 hours.

English Embrocation.

Make an emulsion of equal parts of diluted acetic acid and oil of turpentine, using two eggs to each pint of the mixture.

Assay of Gelsemium.

BY PROF. L. E. SAYRE.

It has been suggested by different pharmacists that among the assays in the United States Pharmacopœia IX, should be found one for gelsemium and its preparations.

The writer has previously recommended the Webster process for gelsemium as the one likely to prove most efficient.* Some tests were made of this process, which were the basis for this recommendation. During the past few months this study has been taken up again and the writer desires to bring before those who are interested in assay processes, the results of this investigation.

The process suggested for the assay will be given in detail, the fluidextract being used as an example.

ASSAY OF FLUIDEXTRACT OF GELSEMIUM.

Fluidextract of gelsemium. . . . 10 c.c. (mils).

Chloroform,

Ether,

Alcohol,

Distilled water,

Tartaric acid,

Potassium hydroxide solution (20 per cent. KOH),

Half-normal sulphuric acid, V. S.,

Hundredth-normal sulphuric acid, V. S.,

Hundredth - normal potassium hydroxide, V. S.,

Cochineal, T. S. . . . of each, a sufficient quantity.

Transfer 10 c.c. (mils) of fluidextract of gelsemium by means of a graduated pipette to an Erlenmeyer flask of about 100 c.c. (mils) capacity. To this add 1.5 grammes of tartaric acid; agitate and separate the liquid from the precipitate by filtering through a filter paper into a graduated flask of 100 c.c. (mils) capacity, washing the precipitate with alcohol. Add sufficient alcohol to the filtrate to make 100 c.c. (mils); shake well and set aside for a few minutes. Filter again, if necessary, and transfer 50 c.c. (mils) of the alcoholic filtrate by means of a graduated pipette to a shallow dish of six-inches diameter, and evaporate it to dryness with the aid of a water-bath rotating the contents of the dish occasionally, and especially toward the end of the evaporation, so that the resulting extract may cover a large portion of the basin. Add 10 c.c. (mils) of half-normal sulphuric acid, and rotate the liquid in the dish until the extract is dissolved or disintegrated; set aside for two minutes. Filter the liquid through a small, firmly-packed pledget of absorbent cotton, previously washed with water, into a separator of about 150 c.c. (mils) capacity, rinsing the evaporating dish with two successive 5 c.c. (mils) portions of water, stirring to disintegrate the insoluble substances. Transfer the rinsings to the separator by filtering through this same pledget of cotton.

To the separator add 20 c.c. (mils) of a mixture of 16 c.c. (mils) of chloroform and 4 c.c. (mils) of ether; add 4 c.c. (mils) or a sufficient quantity of 20 per cent. solution of potassium hydroxide and shake vigorously. When the fluids have separated—first drawing off the chloroform-ether liquid into a second separator containing 15 c.c. (mils) of distilled water,

and after agitating as before—draw off the chloroform-ether liquid into a third separator containing 15 c.c. (mils) of distilled water; agitate, again transfer the chloroform-ether liquid through a chloroform-washed pledget of cotton into a fourth separator of about 150 c.c. (mils) capacity. Repeat the extraction with three successive portions of 20, 15 and 15 c.c. (mils), respectively, of the chloroform-ether solution, which finally collect, after washing as before, into separator number four. To the bulked ethereal-extracts add an excess of hundredth-normal sulphuric acid (20 c.c. [mils]) and shake thoroughly. Allow the liquids to separate and draw off the chloroform-ether layer. Add to the aqueous acidulated layer a few drops of cochineal T. S. and titrate back with hundredth-normal potassium hydroxide solution until the aqueous solution just turns violet. Subtract the number of cubic centimeters (mils) of hundredth-normal KOH taken, from the number of cubic centimeters (mils) of hundredth-normal sulphuric acid (20 c.c. [mils]) taken, and multiply the remainder by 0.00408, and the product by 20, which will give the weight in grammes of alkaloids contained in 100 c.c. (mils) of the fluidextract of gelsemium.

During the process of washing the chloroform-ether solvent with distilled water, it was thought, perhaps, that a small quantity of the alkaloids was taken up by the distilled water. To confirm this the aqueous solution was tested with Mayer's reagent and gave positive results.

An attempt was made to eliminate this loss by using a process identical with the one given, except a saturated solution of sodium chloride was used in place of distilled water in washing the chloroform-ether solvent: On testing this saturated solution of sodium chloride afterward for alkaloids with Mayer's reagent, negative results were obtained.

However, when making the final titrations with hundredth-normal potassium hydroxide solution, the results were practically the same as those obtained by the original process, showing that the loss sustained while washing the chloroform-ether solvent with distilled water, if any, was so small that it made no difference in the final calculations.

Besides the Webster process for assaying gelsemium, other processes were tested to compare with the Webster process.

One quite similar to Farr and Wright's (Lyons, *Assay of Drugs*, pages 161 to 163,) was experimented on, which gave uniform results, but, unfortunately, is too complicated for ordinary usage; and it might be added that the results obtained by this process were lower, as will be seen in the calculations tabulated below, than the results obtained from the Webster process.

The process when applied to the fluidextract of gelsemium is identical with the Webster process up to the point where the aqueous solution containing the alkaloid is made alkaline.

The aqueous solution is rendered alkaline with ammonia and then shaken out with three portions of chloroform, (15, 10 and 10 c.c. [mils]). The chloroform is then washed with four successive portions (5 c.c. [mils]) of water containing about 1.5 per cent. of sulphuric acid. The acid solutions are united, an excess of Wagner's reagent is added, and the mixture set by until the precipitate has subsided, leaving the fluid clear.

The fluid is decanted through a small filter, the fil-

*Proceedings of the American Pharmaceutical Association for 1907, page 357.

ter washed with a little water, and then 5 c.c. (mils) of a 5 per cent. solution of sulphurous acid is passed through it into the flask containing the alkaloidal precipitate. The flask is allowed to stand with occasional agitation until the alkaloidal periodides have been wholly decomposed, as shown by the absence of dark-colored particles. The solution is then filtered, the flask and filter are washed, first with 2 to 3 c.c. (mils) of sulphurous acid, then with water until the washings are no longer precipitated by Mayer's reagent. The filtrate and washings are made alkaline with ammonia and shaken with three successive portions of chloroform, (15, 10 and 10 c.c. [mils]), the chloroform evaporated, the residue dried at 100°C., and weighed.

RESULTS OBTAINED FROM ASSAY OF FLUIDEXTRACT OF GELSEMIUM.

1 c.c. (mil) of hundredth-normal sulphuric acid is neutralized by 0.00408 grammes of alkaloid present in gelsemium.

This equivalent 0.00408 is given in Lyons' Assay of Drugs, page 55.

WEBSTER PROCESS.

Total Alkaloids in 5 c.c. (mils) of Fluidextract of Gelsemium.

	First Assay.	Second Assay.
Sample 1.....	0.0082 grammes.	0.0086 grammes.
Sample 2.....	0.0048 grammes.	0.0042 grammes.
Sample 3.....	0.0060 grammes.	0.0066 grammes.
Sample 4.....	0.0104 grammes.	0.0097 grammes.
Sample 5.....	0.0191 grammes.	0.0193 grammes.

PROCESS SIMILAR TO FARR AND WRIGHT'S (GRAVIMETRIC).

Total Alkaloids in 5 c.c. (mils) of Fluidextract of Gelsemium.

	First Assay.	Second Assay.
Sample 5.....	0.0135 grammes.	0.0132 grammes.
Same as above.		

Owing to the fact of our connection with the State Drug Laboratory for the analysis of drugs under the pure food law, it has been frequently necessary for us quickly to separate the grossly sub-standard material from the standard. We have found that this can be done best by a short and rapid process; a process that will give at least approximate results. For this purpose we have much respect for Mayer's reagent in estimating alkaloids. We quite agree with Dr. Lyons that the precipitate produced by this reagent is of sufficiently constant composition to be available for purposes of gravimetric estimations. In the case of gelsemium, when we have a mixture of colorless and colored alkaloids to deal with, the process of precipitation by Mayer's reagent is especially advantageous. For this purpose the alkaloidal solution must be brought to a certain dilution, the alcohol driven off the preparation by a low heat, and the solution acidulated. The reagent is then added in excess, the precipitate is allowed to stand several hours before collecting, is washed carefully, dried at 100° C., and weighed. By this method we have been able to obtain very concordant and reliable results. If the analyst establishes for himself the relation between the weight of Mayer's reagent precipitated (obtained from solution of uniform dilution) and the weight of combined alkaloid of gelsemium, which can be done by the more elaborate processes, he can safely employ the Mayer's reagent as above indicated and obtain reliable results concerning the alkaloidal strength of gelsemium preparations.

Drugs to Prevent Burglary and Hold-Ups.

By YOUNG SLEUTH.

Not long since drugs defeated the plans of burglars to rob the safe of a bank in South Dakota. Similar incidents of a like nature are on record. In the case of the bank, the cashier had placed a bottle of formaldehyde solution between the inner and outer doors of the safe. When the exterior door was blown open the bottle containing the drug was broken and the fumes quickly spread throughout the room. Evi-

Device Intended to Prevent Burglary.

dently these were of sufficient strength to cause the burglars alarm; perhaps they thought the heavy volume of formaldehyde vapors was the advance of some kind of a trick explosion that would annihilate them. Anyhow they fled. Not long after this event other owners of property adopted like plans for the protection of safes, stocks of goods, apartments and other places.

The use of drugs to prevent persons from interfering with property that does not belong to them has been in vogue a long time. In recent years some attention has been given to the traffic in anti-burglar drugs in the drug stores. While there is no special department for handling drugs for use for burglar protection, almost any druggist can put up a compound which, if released at the right time, will produce blinding or suffocating fumes to the embarrassment of the burglar who "monkies" with the same. The drug for use in this connection is put up in a strong bottle in which it may be kept for a long time out of the way of harm. A small ink bottle may be used to advantage because of its comparatively large bottom which prevents it from upsetting. In such a container the formaldehyde solution, ammonia water, or other drug or chemical may be confined by means of a cork. Then the cork may be provided with a string and the string may be attached to a part of a window sash, as shown in figure 1. The bottle should be secured with wire or cords to the window sill, so that when the intruder lifts the window to enter, the pull of the cord cannot lift the bottle, but only draw the cork. As soon as the cork is thus pulled forth, the escaping fumes of the drug are liable to come squarely into contact with the face of the burglar. It is not likely that any permanent injury will result, unless the thief in his astonishment leaps to the earth and so receives a hard bump. The chances are that the blast of fumes in his face will cause him to give up the job or make him sneeze and create a noise which will arouse the occupants of the house.

Sometimes, instead of fuming drugs being requested for the purpose under discussion, the drug clerk is asked to put up a pair of bellows containing

the necessary attachments for shooting forth a blast of insect powder into the eyes of the intruder who is trying to break and enter. Figure 2 illustrates the mechanical construction of such a device. A common pair of insect powder blowing bellows is furnished with its nozzle arranged as shown in the drawing. The bellows are arranged on the inside of the window frame as shown. A cord is attached to the lower part of the window sash. This cord passes over two grooved wheels below, thence to the upper part of the bellows. When the burglar pries up the sash the movement of the same draws the cord and the cord depresses the bellows and the blast of air blows forth

Automatic Powder Blower to Frighten Burglars.

the powder into the face of the burglar. The latter is supposed then to do his part, which is to flee.

Anyone with a little mechanical ingenuity can easily adapt the devices illustrated to use on doors and elsewhere.

There have lately been an unusual number of "hold-ups" in stores of all kinds, and it behooves managers and salesmen to be on the lookout for the hold-up men. The writer has found that in some cases the thieves managed to get away with the loot very readily. In other cases the salesmen made so much disturbance that the robbers departed without replenishing their supply of cash. There are cases recorded of how quick-witted saleswomen have prevented loss of money through thieves by alert action. Sometimes a quick police call or even the appearance of a watch-dog on the scene will upset the plans of the thief and make him flee. Then again some of the clerks have been able to divert the would-be robber of the cash register by means of ammonia water or acid, and there have been cases in which thefts of the kind referred to have been prevented by the use of red pepper cast into the eyes of the "bad men."

Firearms are dangerous to have about the place. In the old days of the money till one could almost always find a loaded revolver in the drawer. In very many cases in which the till was looted the thief got first hold of the revolver and turned it on the people in the store. Accidents followed the use of the pistol secreted in side places. Hence the firearm has been cut out of the plan of fortification of the cash in most of the stores.

Store robbers used to depend a great deal upon sand-bagging and clubbing in making a raid on money drawers. Threats of cutting and shooting were common. But in these days of advancement in every line, the cash-register thieves work on different plans. Occasionally an out-of-date "bad man" appears on the scene with drawn revolver or stuffed club and attempts to frighten the people back of the counter

into fleeing or giving up the cash. Sometimes he accomplishes his purpose with an unloaded rusty weapon. Then again he does not, but is run off and makes good his escape before the arrival of an officer.

The really up-to-date cash-register robber is a man of genteel appearance, takes his time and carries no weapon of any kind—for to be caught with one would mean incrimination. He depends upon the deftness of his fingers and his mechanical genius. He makes a study of cash drawers and cash registers. He knows the mechanical operation of all the new types of devices for the keeping and registering of cash. He understands salesmen and customers. He waits until his "pal" or some other patron is receiving the attention of the salesman nearest the cash register and then he does some quick work. Even if the bell rings when he opens the drawer, it is seldom that any attention is paid to it, because the bell is sounding every few minutes when the clerks make change. As soon as possible the man scoops out the cash and has been known to get out without being stopped. If detected in the act he simply makes haste and often gets out before the clerks can get him surrounded. He almost always makes a bluff at drawing a revolver if he is chased and this keeps the salesmen and the average civilian at a comfortable distance. Of course if the police are near, his chances of getting free are slim, but that is a chance he is willing to take, and generally it is in his favor.

In order to protect himself from hold-ups, one druggist arranged an old coffee-mill overhead and filled this with pepper. A cord extended from the opening valve in the bottom of the mill to a place near the cash register below. In the event of a hold-up, the clerk, with hands up, could pull the cord, open the valve above and precipitate a cloud of red pepper into the face of the "artist."

Various other plans have been worked out for the safety of the cash drawer. Cash registers have been the means of saving a great deal of money for the proprietors of stores in many ways, but the expert is always in the field. With cash registers it is about the same as it is with bank safes; the bank-safe looter becomes more scientific in breaking into the new devices as the safe makers become more skilled in increasing the resisting power of their output.

Ground Plan for a Strong Article.

Morning.—"But Mac, down the street is selling them for 35 cents; why should I pay you 40?"

Druggist marks his down to 35 cents.

Noon.—Druggist sends a friend down to Mac's with 35 cents to make the purchase. Friend comes back with a grade B, while the druggist's own stock is of grade A.

Night.—Druggist and Mac get together and see how the lying public are making fools of them by playing one against the other, and resolve then and there to be made fools of in this way no longer.

L'Envoi.—Who wouldn't rather be sensible at a profit than a fool at a loss?

German Spearmint Oil.

In addition to l-carvone, Elze (*Chem. Zeit.*) has isolated from the oil of curled mint (*mentha crispata*), phellandren and dihydrocumene alcohol, the latter probably being present in the oil as acetic ester. A small amount of valerianic acid is also present.

Saffron and Its Adulterants.*

BY EUGENE COLLIN.

Saffron consists of the upper part of the style, and the three stigmatic branches of *crocus sativus* L, a small bulbous plant, native to Persia. It is widely cultivated in France, Bavaria, Austria, Italy, and in Spain especially in the provinces of Andalusia, Murcia and Valencia. In France the cultivation is localized in the departments of Seine-et-Marne, Eure-et-Loir, and Loiret. The saffron collected in these parts of France is generally called safran de Gâtinais. Saffron is also gathered in smaller quantities in Charante near Angoulême and in Vaucluse near Avignon.

Three kinds of saffron are chiefly marketed [in France] Austrian saffron, French saffron, and Oriental saffron. Austrian saffron, which is considered the best, is used only to a small extent. It consists entirely of the stigmas of *crocus sativus*, and possesses a uniform red-brown or purplish-brown color. In French saffron, the stigmas are accompanied by

Figure 1. Stigma of Saffron and its Substitutes (natural size).

A, stigma of *crocus sativus*; B, flower of *carthamus tinctorius*; C, flower of *cynara cardunculus*; D, semi-floret of *calendula officinalis*; E, flower of *lyperia crocea*; F, stamen of *crocus sativus*.

more or less, long pieces of the style, which, being less colored, give the commercial product a varied color, red-brown mixed with yellow. It is derived from the same plant as the Austrian saffron and is used very widely. The Oriental saffron, which is much less prized, is a moist, sticky, red-brown mixture of stigmas, parts of styles, corollas, and pollen grains of *crocus vernus*. It possesses a much weaker odor than the Austrian and French varieties. Spain produces several kinds of saffron, which vary greatly in quality, the better sorts resembling the saffron of Gâtinais; the inferior kinds, which are varnished with fatty substances, should be rejected.

DESCRIPTIONS.

Commercial saffron is in the form of a loose mass of thread-like stigmas dentated at the upper parts, which are widened in a funnel like shape (figure 1, A). In an unbroken state the stigmas are united in threes at the upper end of the style, which is colored red at the top and yellowish-white at the lower part. Saffron is greasy to the touch, elastic, flexible and

possesses a dark orange-red color. It has a peculiar aromatic odor and a spicy bitter taste.

The cross section of the stigma of saffron (figure

Figure 2. Cross-Section of a Stigma of Saffron (250 diameters).

es, upper epidermis; par, parenchyma; ffv, fibrovascular bundle; ei lower epidermis.

2) shows a parenchyma (par) formed of irregular polygonal cells, with rather thin walls and filled with an orange-red coloring matter, easily soluble in water. This parenchyma is furrowed by a few fibrovascular bundles and covered on both sides by an epidermis (es, ei) consisting of a row of tabular cells slightly elongated perpendicularly to the surface of the stigma. The epidermal cells are protected by a thin cuticle. Farther down they show towards the middle of their exterior wall a wart-like projection, which makes the two edges of the cross section appear slightly sinuate. In looking at the arrangement of the epidermis from the front, this projection (pr, figure 3) can easily be distinguished; it has different appearances. The epidermal cells exhibit when viewed in this manner, a polygonal form and are elongated parallel to the direction of the stigma. The upper part of the stigmatic branches is trimmed with numerous cylindrical papillæ, rounded at the top and three or four times longer than wide.

The style has a structure identical with that of the stigma; it is furrowed by a small fibrovascular bundle but contains much less coloring matter than the stigma. Its epidermal cells are very long, and they have thin, slightly curved walls (EST, figure 4).

On spreading out under the microscope a small piece of the stigma of saffron, almost always one or more pollen grains can be seen. These are very thick (0.12 mm.), and round, and have a thick smooth covering (po, figure 4).

Commercial powdered saffron is characterized by the following constituents (figure 4):

1. Epidermal fragments of the stigma (ES) consisting of elongated cells, rather regularly super-

Figure 3. Upper Part of Stigma, Front View.

ep, epidermis; pa, papillæ; pr, protuberances.

posed, all directed in the same way, which is parallel to the length of the stigma; many of these cells are furnished with small protuberances which form a most important element for the identification of saffron. According to the way these protuberances (pr) are viewed, they appear either as cones or as concentric circles; they are less and less numerous and obvious as the distance from the upper part of the stigma increases. The epidermal fragments are at times isolated and at other times still adherent to the subjacent tissue, which is always furrowed by tracheæ.

*Translated from the *Annales des Falsifications* by THE DRUGGISTS CIRCULAR.

2. Irregular parenchymatic fragments, rather uncommon, representing the transverse section of the stigma (*ST*); they are formed of seven to

As being also of great importance, I may mention that powdered saffron should not contain starch, crystals, woody fibers, spotted ducts, sclerotic cells, glandular or protective hairs, secretion canals, or secretion cells.

Figure 4. Anatomical Constituents of Powdered Saffron (250 diameters).

ANT, fragments of the stamens; *ES*, epidermis of the stigma with protuberances (*pr*); *EST*, epidermis of the style; *ESP*, edge of the stigma; *ST*, transverse fragments of the stigma; *PA*, papillae of the stigma; *PO*, pollen grains; *ST'*, longitudinal fragments of the stigma; *STY*, fragments of the style; *ffv*, fibrovascular bundles.

eight layers of irregular cells, bordered on both sides by a row of epidermal cells (*ee*, *ei*). More numerous are the longitudinal fragments of the stigmatic tissue (*ST'*). They consist of the parenchyma of elongated cells, almost always furrowed by a small fibrovascular bundle (*ffv*).

3. Elongated papillae (*PA*) arising from the uppermost and enlarged part of the stigma, which appear like the fingers of a glove, and are either isolated or grouped and still adherent to small fragments of the stigma (*ESP*).

4. Some pollen grains (*PO*), round and very large, measuring 60 to 70 microns and enclosed in a rather thick skin.

5. Fragments of the style, consisting at times of its epidermis (*EST*), and again, of the epidermis and the subjacent tissue (*STY*). The epidermis of the style differs from that of the stigma in the sinuosity of the cell-walls. The subjacent tissue differs from that of the stigma in the absence of yellow coloring matter in the lower part of the style.

6. Fragments of the anthers (*ANT*), which are quite uncommon in good Gâtinais saffron. These consist of long dotted cells, with walls provided with transverse reticular and almost parallel thickenings, which give the cells a characteristic appearance.

NORMAL IMPURITIES IN SAFFRON.

Like all natural products, saffron is seldom absolutely pure. The exotic saffron especially often arrives in a very contaminated condition owing to the lack of care during the gathering of it; there are present at times fragments of straw, of manure, of herbs, and of the leaves, corollas, stamens, and pollen grains of crocus. Sometimes various odd substances are found, which are present on account of the negligence of the workmen employed in the sorting of the saffron. Before being put up for sale, the saffron should be freed of all foreign material and the commercial product should not contain other than the normal impurities, that is, pollen grains and a few stamens, which on account of their thinness, may easily be overlooked.

The presence and the amount of pollen grains can easily be discovered by the amount of dust which is produced when the saffron is tossed on a piece of white paper. The presence of stamens is shown by the existence of yellowish filaments, which differ from the styles in their uniform color, their

Figure 5. Powdered Saffron Containing an Abnormal Proportion of Stamens (120 diameters).

ANT, fragments of anthers; *ES*, epidermis of the stigma with its protuberances; *ESP*, upper end of the stigma; *EST*, epidermis of the style; *ST*, transverse fragments of the stigma; *PA*, papillae of the stigma; *PO*, pollen grains; *ST'*, longitudinal fragments of the stigma; *STY*, fragments of the style.

greater width, their irregular contour and their shriveled form. When thrown into water the stamens appear as elongated sacs, rounded at the top and forked at the base, measuring 20 to 22 mm. in length, and 3 mm. in width, and divided into two distinct compartments. Almost always they are provided with a part of their fillet.

In powdered saffron the presence of stamens is revealed by the existence of membranous fragments composed of polygonal cells, which are all elongated in the same direction and furnished with distinctly parallel and quite characteristic thickenings (*ANT*, figures 4 and 5). While very rare in Gâtinais saffron, this impurity is very common in Spanish saffron. From the yellow color of the latter the proportion of stamens can easily be estimated. It is more difficult to determine the amount of stamens in powdered saffron, but a saffron which shows a larger amount of anthers than are apparent in figure 5, can safely be considered as a commercially impure product. The microscopic reproduction, figure 5, can be used with advantage as a control.

Some brands of saffron are imperfectly cleansed, or mixed with remains of the sorting, or weighted with a product called in commerce *saffron jaune de Salonique* (yellow Salonica saffron), which is nothing but the dried stamens of saffron.

The presence of a large proportion of stamens does not necessarily involve the presence of a large quantity of pollen grains. The stamens are very friable; they dry up very rapidly and release the pollen grains which, recovered by successive siftings, form a commercial by-product of saffron. Often, however, they are used again for weighting powdered saffron.

ASSAY OF SAFFRON.

The analyst who is called upon to examine saffron should at first ascertain the weight of the product under examination: fifty filaments, each representing a part of the style with the three stigmas weigh about 337 milligrammes.

Saffron should be soft and elastic without being sticky. When pressed between the fingers, it should not adhere to the latter. It should cut without resistance, should not have a horny consistence, and when broken should not snap with a sharp noise.

Thrown into a glass of water, saffron should remain at the surface of the liquid and should not lose its shape. It should impart to the water its beautiful golden yellow color, without rendering the liquid turbid. It should not deposit any insoluble powder.

Unless it is of Austrian origin or consists entirely of stigmatic branches, saffron should not have a uniform color in its whole length, because the lower part of the style has a much paler or yellowish color.

Saffron should contain only a very small amount of stamens and pollen grains.

When treated with concentrated sulphuric acid, saffron, both whole and powdered, should assume an indigo-blue color turning to purple and finally to

brown. Placed on the tongue, saffron should not exhibit a salty or sugary taste. Dried at 100° C. it should lose at most 14 per cent. of its weight. On incineration it should yield not more than 6 to 7 per cent. of white, non-fusible ash.

ADULTERANTS.

On account of the high price of saffron it has always been subjected to many kinds of sophistication. These consist in substituting wholly or in part flowers or fragments of flowers, which when dry and shriveled may have a faint resemblance to saffron. Inasmuch, however, as the natural color of these flowers is entirely different from that of saffron, they are colored artificially with some anilin dye. Very frequently saffron and its substitutes are

mixed with various substances which are added to increase the weight.

The principal vegetable substitutes for saffron are the flowers of *carthamus tinctorius* (*B*, figure 1), *cynara scolymus*, *cynara cardunculus* (*C*), *scolymus hispanicus*, *calendula officinalis* (*D*), *lyperia crocea*, and *arnica montana*; the petals of the peony, the poppy, *pulicaria vulgaris*, and *punica granatum*; the stigmas of maize, and of other species of crocus; the flowers of various cyperaceæ; fragments of various colored algæ, such as *fucus amylaceus* and others; powdered capsicum, *Pernambuco* wood, *Campeachy* wood, red saunders and turmeric.

Among the other substances with which saffron is adulterated are sugar, glucose, honey, barium sulphate, borax, sodium nitrate, potassium nitrate and potassium boro-tartrate. Among others the following dyes are used for coloring the substitutes of saffron: The salts of dinitroresol, safranin, fuchsin,

crysoidin, Martius yellow, quinolin yellow, naphthol yellow, orange II, and brilliant yellow.

I shall hereinafter describe as briefly as possible the characteristics which permit the detection of these adulterants, and I shall lay stress particularly on those which are most frequently used for sophistication.

CARTHAMUS TINCTORIUS.

The florets of safflower (*B.* figure 1), also known as bastard saffron, or false saffron, are supplied by *carthamus tinctorius*, of the *synanthereæ* family. They consist of a long thread-like tube which unrolls itself in a limb with five linear divisions. From the orifice of this tube the hollow and doubled cylinder emerges, formed by the united anthers, into which passes a thread-like style, thickened towards the top.

The florets of safflower have a beautiful orange-red color, localized in the limb. The pigment of these flowers consists of two coloring principles, a yellow one soluble in water, and a carmine-red one, which is insoluble in water and in oil, and which remains in the cellular web.

Powdered safflower chiefly is used for adulterating saffron. It is one of the sophistications which I most often have had occasion to identify. The very peculiar way in which the powdered safflower behaves towards water, which cannot remove from it the carmine-red coloring matter, suffices to indicate the presence of this substance in saffron. This important sign is verified by the comparison of the anatomical characteristics.

The chief elements in the determination of this powder are—

1. The presence of very numerous round pollen grains (*po*, figure 6), colored golden-yellow, covered with small hairs and furnished with three or more or less distinct pores. These pollen grains are smaller than those of saffron and measure 30 to 40 microns in diameter.

2. Epidermal fragments of the style (*EST*), characterized by a profusion of small hairs (*ps*) which are inserted upon them; many of these hairs, which are very deciduous, are scattered throughout the sample. They are very short, unicellular, conical and more or

less thin at the top. The parenchyma of the style (*ST*) is formed by a thick tissue, furrowed by narrow fibrovascular bundles and by secretion canals (*cs*) of varying sizes, and filled with a brown resinous substance.

3. Numerous fragments of the tube and limb of the corolla (*EFL*). The epidermis of these is formed of long, superposed cells, with thin and slightly sinuous walls. The subjacent tissue, which has a carmine-red color, is furrowed by distinct secretion canals and thin tracheæ. Towards the top of the divisions of the corolla, the epidermis takes on a warty form (*EFLS*), and small prismatic crystals can be seen in the cells of the subjacent tissue (*cr*).

4. Fragments of the staminal tube (*TST*) with a very complicated structure. Its component parts, which are always uncolored, assume quite variable forms. The sutures of the stamens are indicated by reticular thickenings (*sc*) which are very distinct. The tissue of the anthers is formed of long cells (*ant*) with thickened and furrowed walls.

FLOWERS OF THE CYNAREÆ.

For adulterating saffron, the flowers of *cynara cardunculus*, *cynara scolymus*, and *scolymus hispanicus* are used. Inasmuch as these flowers in drying lose their natural color, which is moreover never yellow, they are colored artificially with azo dyes.

The flowers of *cynara cardunculus* consist of a five-lobed corolla 12 to

14 millimeters long, ending in a tube twice as long. The lobes of the corolla, united in almost their entire length, are free only at their uppermost end. At the top of the corolla appears the slightly projecting staminal tube, dentate and formed by the reunion of the stamens. In the middle of this stamen tube is a long style, ending in a colored two-cleft stigma.

An adulteration of whole saffron with these flowers can easily be detected by simply immersing the sample in lukewarm water, to which the *cynareæ* yield almost immediately their artificial coloring, which is totally different from that of the stigmas of saffron.

When the flowers of *cynara cardunculus* are reduced to a powder, they show a number of anatomical characteristics by which their addition to saffron can

cu, channeled cuticle; *ep*, epidermis of a semi-floret; *par*, parenchyma of a semi-floret; *pg*, glandular hair; *po*, pollen grains; *pt* and *pt'*, broken protective hairs.

easily be detected. These are (1) numerous tubercular pollen grains showing three distinct pores and smaller than the pollen grains of saffron; (2) secretion canals in the tissue of the corolla, and pluricellular secretion hairs at its surface; (3) very many calcium oxalate crystals located in the lower part of the lobes of the corolla; (4) fragments of the style and the stigmas covered with conical papillæ; and (5) parenchymatic fragments arising from the staminal tube and characterized by the polymorphism of their

cells which have dotted walls or very manifest thickenings.

Notwithstanding the anatomical resemblance to the fragments of safflower, those of the cynaræ can be distinguished from the former by the absence of the red-violet coloring matter which remains in safflower when immersed in warm water.

CALENDULA OFFICINALIS.

The semi-florets of marigold (*calendula officinalis*), also called *fémelle*, are used for adulterating saffron. The corolla of this flower which is drawn out from the outer part of the cup in a little tongue or ligule with four nerves and having a dentate edge at the top, becomes narrower and forms a tube at its lower part and is covered with hairs visible to the naked eye or when viewed with a magnifying glass. When fresh, these florets have a magnificent golden-yellow color, which bleaches out or even disappears altogether during the drying process. When used for adulterating saffron, they are colored with a coal-tar dye.

The adulteration of saffron with marigold can easily be detected. Immersion in lukewarm water will remove the artificial dye and restore the natural shape of the marigold florets, which is totally different from that of the stigmas of saffron. When saffron is sophisticated with powdered marigold, the following constituents are found in the powder: (1) Pollen grains covered with

small points and showing three distinct pores; (2) epidermal fragments formed by striated cells, always containing easily visible oil globules, and (3) frag-

ments of glandular and protecting hairs located at the base of the corolla. These hairs are always polycellular. They appear seldom in one series, more generally

which forms the limb. The latter is divided into two unequal lips; the upper one is obscurely bilobate, the lower one has three lobes, of which the middle one is somewhat better developed. At the lower part of the tube of the corolla is a small calyx with five teeth. Whenever this flower is used for adulterating saffron it is colored with azo dyes. This adulteration can easily be detected by treating the product with tepid water, which will remove the coloring matter and restore the original shape of the flower, which is entirely different from that of the stigma of saffron. Anatomically this flower and its powder are characterized by the presence of quadricellular secretion glands on the limb and the tube of the corolla, which at times are quite confluent, and by some bicellular glands, which, however, are very infrequent (see figure 9).

Figure 11. Components of Powdered Berries of *Physalis Alkekengi* (120 diameters).

ep, epicarp; ep', epicarp treated with potassium hydroxide; alb, albumin of the seed; te, external coat of the seed, front view; te', the same, side view; ti, inside seed coat.

in several series. The glands which crown the secretion hairs are always polycellular (see figure 8).

LYPERIA CROCEA.

Lyperia crocea, a plant of the *scrophulariaceæ*, commercially known as cape saffron, occurs as a small reddish flower about 2½ centimeters in length. Its gamopetalous corolla, irregularly tubulated and constricted at its base is abruptly enlarged at the top,

artificial coloring which is entirely different from that of saffron, and which is easily soluble in water, suffices to arouse suspicion as to the purity of the product. When the decolorized filaments are examined under a microscope the corn silk can at once be detected by the numerous polycellular and polyserial hairs on the epidermis; these resemble those which are found at the base of the semi-florets of marigold. Fragments of these hairs are always found in powdered corn silk.

CAPSICUM.

I have very often identified powdered capsicum as an adulterant in powdered saffron. Sophistication of the latter with capsicum, commercially called *poudre de poivron* is very common around Marseilles and in Tunisia. The addition of this substance to powdered saffron introduces constituents which are entirely different from those of saffron and strike the attention of the observer at once, as may be seen in figure 10. Interspersed with the fragments of saffron, which are always transparent, soft and easily to be separated, the constituents of capsicum can clearly be distinguished as the latter are opaque, resist separation, and have various shapes. They comprise (1) fragments of the epicarp (EPP) formed of polyhedral cells with thick and clearly spotted walls; (2) fragments of the mesocarp (PAP) with polyhedral cells containing yellow oil globules; (3) fragments of the endocarp (END) with sinuous cell walls which facilitate the identification considerably; and (4) fragments of the sclerotic coat of the seeds (TEP), clearly characterized by their large dimensions and by the polymorphism of their cells which have markedly sinuous walls resembling intestines. Not one of these constituents resembles those which are present in powdered saffron.

Probably for the purpose of discrediting the experts or to fill their minds or those of the judges with

Figure 12. Constituents of Powdered Turmeric (250 diameters).

a, isolated grains of starch; ep, epidermis of the rhizome; cs, secretion canal; pc, cortical parenchyma; pl, woody parenchyma; li, inner bark; go, oleoresin-producing glands; v, streaked and dotted ducts; s, side view of corky cells; s', front view of corky cells.

doubt, the defrauders in the neighborhood of Marseilles have tried to deny that saffron is adulterated with capsicum, basing their denial on the biting taste of the fruit and seeds of capsicum. This contention does not hold, because every naturalist and clever defrauder knows well enough that the pericarp of the whole fruit of capsicum, which is chiefly used as an adulterant of saffron, contains only a limited amount

Figure 13. Constituents of Powdered Pernambuco Wood.

cr, crystals of calcium oxalate; *fl*, woody fibers; *pl*, woody parenchyma; *rm*, medullary rays; *v*, ducts.

of a substance, the placenta, which is excessively sharp in taste, and this can easily be separated by grating.

It is claimed that instead of capsicum the fruit of another solanaceæ has been taken. This is the winter-cherry (*physalis alkekengi*) the pericarp of which in a fresh state is colored red. An examination of figure 11, which illustrates the anatomical constituents of powdered *physalis* shows that, although the sclerotic coats of the seeds of *physalis* resemble those of capsicum, due to the near relationship of the two plants, other very characteristic constituents prevent confusion. Among others there are the shape and the entirely different arrangement of the cells of the epicarp (*ep*, *ep'*), and especially the absence in *physalis* of these cells of the endocarp, which by their windings and the constancy of their characters form an essential constituent in powdered capsicum. The inner coat of the seeds of *physalis* (*ti*) is perfectly characteristic. On account of the beautiful color of their pericarp the berries of *physalis* are very probably used for adulterating saffron; but in all samples which I have been asked to examine and in all those in which the addition of capsicum was alleged, I have found a large amount of capsicum, but only a small amount of *physalis*.

CURCUMA.

The addition of powdered turmeric to saffron gives to the latter the property of being colored blue when treated with iodine-potassium iodide solution. By microscopical examination of a powder, thus sophisticated, the presence of two forms of starch grains can easily be detected. These appear either as elongated isolated grains (*a*, figure 12), pointed at one end and

marked with parallel stripes, or as less distinct, much smaller grains, united as a compact mass and in the shape of a paste in the sufficiently large cells of the cortical parenchyma and the woody parenchyma (*pl*, *pc*). In addition to these constituents, large streaked ducts (*v*) and oleoresin-producing cells (*go*) can be found, which are never present in powdered saffron.

SANTALUM RUBRUM.

Powdered red sanders is adapted for the adulteration of saffron, on account of its color. But its identification is very easy; it depends on the presence of large ducts, woody fibers and fragments of a woody parenchyma containing a brown, water-insoluble coloring matter. Besides most of the fibers are accompanied by prismatic crystals, which never are present in saffron.

PERNAMBUCO WOOD.

Quite recently I have had occasion to examine in the Central Laboratory for the Suppression of Frauds one of those small packages of saffron generally sold in southern France for 5 centimes a package. It contained about 75 per cent, of Pernambuco wood, 20 to 25 per cent. of coarsely powdered saffron, and 1 to 2 per cent. of naphthol yellow. These ingredients are mixed so imperfectly, that they can be detected with the naked eye and can be separated with the aid of a magnifying glass. The naphthol yellow being very soluble, at once colors the water, in which the powder is thrown, yellow; the saffron can easily be distinguished by the brown color of the flat pieces of which it is composed from the brown fibrous constituents of Pernambuco wood. When viewed through a microscope the naphthol yellow appears as small needles; the Pernambuco wood shows fibrous fragments, resembling considerably those of red sanders, but differing from the latter in their color, which is a much lighter red-brown than that of red sanders. The

Figure 14. Powdered Saffron Weighted with Barium Sulphate.

sts, fragment of the style with still adhering dust of barium sulphate; *sb*, powdered barium sulphate separated by pressing the stigma while immersed in water.

powder contains fragments of spotted ducts (*v*, figure 13) more or less scattered woody fibers (*fl*), fragments of the woody parenchyma (*pl*), prismatic crystals of calcium oxalate (*cr*), and numerous pieces of medullary rays (*rm*) furrowing perpendicularly the fragments of the fibrous tissue and the woody parenchyma.

STARCH.

Certain rather ignorant defrauders adulterate saf-

fron with starch. I have had occasion to prove this fraud in samples of saffron of a well-known brand. This saffron which is sold in packages at the price of 5 centimes for 15 centigrammes had been mixed with a large amount of sweet pepper. Asked to explain the presence of these strange constituents, one of the accused merchants cited a report which stated that in cases of exotic saffron sometimes one or two pieces of the fruit of pepper and often crusts of bread are found, which were left in them by the carelessness of the men employed in sorting the saffron. The starch of bread crumbs or bread crusts is, however, entirely different from the normal wheat starch which had been willfully added to the sophisticated saffron. Why did they leave in the saffron such substances as the fruits of sweet pepper, which can easily be seen and separated?

WEIGHTED SAFFRON.

The weighting of saffron is one of the most common and most lucrative adulterations. The weighted saffron has sometimes a very beautiful exterior, but very often such an appearance makes the product looks suspicious. For instance, saffron weighted with glycerin, when pressed between two pieces of thin paper leaves a greasy spot on the latter; it remains flexible between the fingers, without adhering to them. Saffron weighted with honey or glucose has a sweet taste and adheres to the fingers when pressed between them.

Saffron, weighted with saline solutions can be distinguished at once by the uniform color, while the color of normal saffron, on the other hand, is always paler, and yellowish at the lower part of the style. Besides, such a saffron usually possesses a peculiar stiffness, derived from the gum or dextrin added to the saline solutions to make them more adherent. This stiffness is entirely different from that acquired by the saffron during the drying process. When cut with a pen-knife or scalpel, saffron so weighted emits a peculiar sharp noise. When thrown into water the weighted filaments immediately sink to the bottom of the liquid; when weighted with a salt, which is soluble in water, the salt separates and forms colored trails which disappear on shaking. If the adulterant is an insoluble salt, it separates as a fine powder, settling at the bottom of the liquid.

By incinerating weighted saffron the nature of the adulterant can be determined. Saffron weighted with honey, sugar or glucose emits an odor of caramel on burning. Saffron adulterated with potassium nitrate or sodium nitrate behaves like paper or vegetable powders impregnated with the same salt.

The presence of borax can easily be proven in saffron adulterated with this salt. The stigmas adulterated with borax, protected by the salt which acts as a fine resister, when ignited remain black and charred; the ash, even after prolonged heating remains dark grey. Placing a pinch of the saffron or the ash in a porcelain dish together with a little sulphuric acid and methyl alcohol, and igniting the latter, a green flame can be noticed in the presence of borax. By the weight of the ash the addition of saline substances can easily be proven and therefore this determination is of importance. The nature of these adulterants can be established by chemical analysis. By microscopical examination the presence of such adulterants can easily be proven also. Viewing a small piece of the stigma, adulterated with insoluble salts, under a micro-

scope, the shape of the saline impurities can easily be distinguished; and by pressing lightly the preparation between two slides, the salt can easily be separated.

Toning Up the Rubber Goods Department.

After trying various plans and schemes, J. E. Taylor reports in the *Bulletin of Pharmacy* that he has found a satisfactory remedy for the common ailments of the rubber goods department. This remedy he applied by removing all the shelves from the front two sections of the "patent-medicine" fixtures in his store, then covering the background with tightly stretched cloth and scattering over this screwed-in brass hooks of various sizes.

On some of these hooks he hung assorted sizes of syringes in a graded rank. From other hooks atomizers were suspended. Hot-water bottles of different sizes were hung in various positions; as were fountain syringes, catheters, piston syringes, eye pipettes, nipples, rings, bulb syringes, bottle brushes, tubing, throat-bags, ice-bags, nipple shields, rubber and glass combinations, breast pumps, colon tubes, syringe bags, baby rattles, veterinary syringes, medicine droppers, etc.

Each article was displayed separately. Over the top were written the name of the article, the cost, and the selling price. Underneath the display case two sets of shelves were put in and solid doors attached. The surplus stock was carried in one space and the empty containers of the display stock were placed in another. The display case was fitted with large glass doors.

Mr. Taylor avers that this display is the best advertisement of rubber goods he has ever used. He believes that any druggist who will take the trouble to arrange his stock in a similar manner will be repaid in the better appearance of his store, in the economical storing of the goods, and in more sales. His sales of rubber goods were almost doubled during the year.

Various Uses for Kerosene.

Kerosene has its place as a therapeutic agent, according to long established household practice, and William R. White, at the 1910 meeting of the American Pharmaceutical Association, presented a paper on its place in pharmacy. As synonyms for the hydrocarbon he mentioned coal oil, rock oil, solar oil, paraffin oil, mineral oil, carbon oil, petre, earth oil, photogene, eupione and refined petroleum. He also said that it has a specific gravity ranging from 0.744 to 0.829, boils above 77° C., and has a flashing point from 62° to 68°. It mixes with such liquids as chloroform, ether, volatile oils and most of the fixed oils, but will not mix well with castor oil, glycerin or alcohol. It will dissolve 4 or 5 per cent. of iodine, if warmed and agitated, the solution resembling very much a certain commercial preparation; it will take up a much larger percentage of iodine if mixed with chloroform.

ITS TASTE AND ODOR.

Proceeding, Mr. White said that saccharin modifies the bad taste of the oil, and that the oils of cassia, cajeput, cloves, peppermint, wintergreen, camphor, and bitter almond will disguise its odor. He also tried shaking it with an acid solution of such oxidizing agents as potassium permanganate, potassium dichromate and potassium chlorate, and then decant-

ing and filtering it through freshly slaked lime, but none of these entirely deodorized it, although each improved it a great deal, the chlorate giving the best results. Kerosene in an alcoholic solution of potassium hydrate turns the alcoholic solution red and the kerosene is almost completely deodorized. By the liberation of nascent hydrogen in kerosene he got an odor resembling that of onions.

TAKEN INTERNALLY.

He gave an instance of the use internally, with suicidal intent, of a pint of kerosene, with no very serious result, and said that it was largely used as a rectal injection for amebic dysentery in quantities of half a gallon or more, with excellent effect. "I have known kerosene to be taken internally in numerous cases of croup in children in from one-half to one teaspoonful doses with good results," he said, and added: "It is also taken frequently for coughs and colds, usually mixed with sugar."

FOR EXTERNAL APPLICATION.

However, its principal therapeutic use is as a liniment, and the following formula was submitted for—

KEROSENE LINIMENT.

Camphor	1.0 gramme.
Oil of peppermint.....	0.5 c.c. (mil.)
Oil of wintergreen.....	0.5 c.c. (mil.)
Oil of cloves.....	0.2 c.c. (mil.)
Oil of cassia.....	4.0 c.c. (mils.)
Oil of cottonseed.....	8.0 c.c. (mils.)
Oil of cajeput.....	8.0 c.c. (mils.)
Oil of turpentine.....	4.0 c.c. (mils.)
Kerosene	72.0 c.c. (mils.)

FOR TOOTHACHE.

Oil of cloves, oil of cassia and phenol dissolved in kerosene make a splendid toothache remedy.

AS AN INSECTICIDE.

Kerosene has already gained rank as one of the best insecticides. Evelyn Groesbeeck Mitchell says an ounce of it sprayed over fifteen square feet kills not only larvæ and pupæ, but catches the adults and is therefore, by virtue of its simplicity, cheapness and efficiency, the best larvacide for many purposes where its odor is not offensive. Kerosene does not harm fish or aquatic insects that breathe on the surface, and acts well in salt water. An emulsion of kerosene can be cheaply made by the following formula:

Green soap.....	2 grammes.
Boiling water.....	32 c.c. (mils.)
Kerosene	64 c.c. (mils.)

Dissolve the soap in the boiling water and add to the kerosene and agitate vigorously. This makes a snow-white emulsion which shows little tendency to separate. It can be used to spray trees, etc., when diluted with water.

AS AN EMBROCATION.

By adding oil of camphor, oil of cajeput, etc., to the emulsion, a splendid liniment may be made.

FOR LIMBER-NECK.

Kerosene also enjoys some reputation as a remedy for the disease known as limber-neck in chickens.

In conclusion Mr. White said: "I have known of its use as a hair tonic, but have not tried it for that purpose yet."

Difficulties in Dispensing.*

By J. LEON LASCOFF.

In the pharmaceutical art, as well as in other arts, many problems confront us which at the first glance seem to be difficult—sometimes apparently impossible to solve—yet, with a little thought and study, it is very easy to overcome these obstacles, to clear away doubt, anxiety, and oftentimes fear; and then we feel proud of our accomplishments.

For this reason, I have chosen as my subject one that is of every-day importance to us, and is met in our daily toil for existence. My subject is "Difficulties in Dispensing." This may seem to you a repetition of an old topic, and indeed in some respects it is; but I have endeavored to present the subject in a new phase, from the standpoint of a true pharmacist, considering how it bears upon our relations with the doctor. Imagine a physician addressing an audience of his colleagues on the subject of "Appendicitis and Its Surgical Treatment"; and yet, when he does so from the standpoint of one who has had especial experience with this disease, with the intention of bringing out new points not yet understood, he immediately receives attention, and something is learned thereby.

In presenting this subject I have three main objects in view: First, to avoid criticism of the writers of prescriptions; second, to encourage the physician to continue prescribing his own combinations instead of the usual stock of proprietaries and ready-made mixtures in general; and third, to make clear the vital importance of using only the best and purest materials from the most reliable manufacturers.

As to the first object: you, as pharmacists, have certainly experienced from time to time some difficulties in making up a particular prescription on account of the apparent incompatibility of the specified ingredients. But with the proper technique at your command you can compound a clear, palatable, nice-looking and presentable mixture, without changing the nature and therapeutic value thereof. Failure to accomplish this result has the tendency to encourage the physician to prescribe ready-made preparations, which he knows, through the sampling system, to be presentable; or he chooses his other privilege of dispensing his own preparations; in other words, deprives you of the opportunity which you as pharmacists have striven for many years to attain.

The cause of very many of the apparently incompatible prescriptions is the fact that inferior grades of chemicals are used by our colleagues; not through any malice aforethought, or for the purpose of saving a few cents, but rather because of the routine methods of ordering the goods from the wholesaler without specifying the grade. I will illustrate this as I go along.

The prescriptions which I present to you today are copies of originals written by members of the medical profession who regard the pharmacists as their professional associates and aids in presenting a medication in a manner and style agreeable to the patient. I shall endeavor to point out the methods I pursue in overcoming the difficulties. I think they are the correct ones.

I.

Corrosive mercuric chloride... 0.1 gramme.

*Read at the December meeting of the Kings County (N. Y.) Pharmaceutical Society and contributed by the author.

Potassium iodide..... 12.0 grammes.
 Syrup of ferrous iodide..... 20.0 grammes.
 Distilled water enough to make 90.0 c.c. (mils).

Direct: A teaspoonful three times a day in water.

The difficulties arising in this prescription are due to the alkalinity and sometimes the impurity of the potassium iodide. If not properly compounded the mixture becomes cloudy and afterwards deposits a brownish precipitate. The proper way to dispense it is the following: Dissolve the potassium iodide in a small quantity of the water; mix with the syrup of ferrous iodide; then dissolve the bichloride in a small quantity of water; add this solution little by little to the first mixture; then add enough water to make the desired quantity. In this way a light-greenish, clear mixture is formed. [If not clear there is danger in dispensing this, as too much of the bichloride might be taken in one dose.]

II.

Fluidextract of cubeb..... 8 c.c. (mils).
 Tincture of hyoscyamus..... 12 c.c. (mils).
 Potassium citrate..... 24 grammes.
 Distilled water..... 60 c.c. (mils).
 Glycerin 24 c.c. (mils).

The physician was well aware of the fact that fluidextract of cubeb is a resinous extract. For that reason he prescribed glycerin, but not enough to hold the resinous extract in suspension. The proper way to dispense this is to dissolve the potassium citrate in a small quantity of water; mix the tinctures and the fluidextract; emulsify with a small quantity of acacia and the glycerin; adding to this the citrate solution there is formed a nice, palatable, good-appearing mixture with the proper proportion of each ingredient.

III.

Protargol 2.0 grammes.
 Cocaine hydrochloride..... 0.5 gramme.
 Distilled water..... 60.0 c.c. (mils).
 Direct: For external use.

Cocaine hydrochloride with protargol in solution forms a cloudy mixture with precipitation. This is due to the chloride in the cocaine salt reacting with the protargol, a salt of silver, and forming silver chloride. By using cocaine nitrate instead of the hydrochloride the mixture is clear without any precipitation whatsoever. The same applies to novocaine: use the nitrate instead of the hydrochloride. At first, when using cocaine hydrochloride, the mixture is clear. Owing to the fact that protargol is an albuminate, the chemical interaction is delayed until the silver is set free to be acted upon by the chlorine, but in a short while one will note the change into a disagreeable and unsightly mixture of no therapeutic value.

IV.

Pyramidon 0.30 gramme.
 Antipyrin 0.20 gramme.
 Phenyl salicylate..... 0.12 gramme.
 Codeine 0.01 gramme.
 Caffeine, citrated..... 0.06 gramme.

To be dispensed in a capsule; twelve to be dispensed.

This mixture compounded in the order in which the ingredients are here written, in a short time will form a liquid mass and the capsules will not be fit to be taken. By triturating the phenyl salicylate, the codeine and the caffeine in a mortar separately with the addition of 2 grains of sugar of milk per dose, then triturating gently the antipyrin with this

mixture and adding at last the pyramidon, one produces a nice, white dry mixture which will keep for any length of time after being enclosed in capsules.

V.

Oil of mustard..... 40 drops.
 Menthol 2 grammes.
 Chloroform 20 c.c. (mils).
 Petrolatum 40 grammes.

To be made into an ointment.

The proper procedure is to melt the petrolatum and put it in a wide-mouthed bottle; dissolve the oil and the menthol in the chloroform; add this solution to the melted petrolatum after it has cooled somewhat; stopper loosely and apply a gentle heat until the ingredients are mixed. The chloroform and the menthol will all be evaporated if exposed to the air or added direct to the petrolatum while it is hot.

VI.

Sodium salicylate..... 4 grammes.
 Sodium bicarbonate..... 12 grammes.
 Distilled water..... 90 c.c. (mils).

To be used as directed.

This mixture will change color. First it will turn brownish and then gradually become black. This is partly due to the presence of iron as an impurity in the sodium salicylate, and partly to the presence of the alkaline salt. By using pure chemicals, the color change can be prevented for at least five or six days, in other words, during the time the medicine is being used by the patient.

VII.

Pills of ichthyol each containing... 0.3 gramme.

Twenty-four to be freshly prepared.

If the ordinary ichthyol be used as such, no matter what kind of excipient is added, the pills will be large enough to be called boluses. Even if sodium ichthyol is used instead of the ammonium compound, the pills will be very large. The way to turn out a nice small-sized pill absolutely free from all additional ingredients is to evaporate the ammonium ichthyol on a water-bath. We know that ichthyol by evaporation loses at least 45 per cent. of its weight. [But so little is known about the character of ichthyol that one scarcely is warranted in subjecting it to the influence of even a gentle heat. We prefer to use the sodium ichthyol for pills.—Editor THE DRUGGISTS CIRCULAR.]

VIII.

Terpinol 6.0 grammes.
 Sodium benzoate..... 6.0 grammes.
 Heroine 0.1 gramme.
 Extract of glycyrrhiza..... 4.0 grammes.

To be dispensed in twenty-four capsules.

This is the most difficult combination with which I have attempted to produce a satisfactory mass. No matter how triturated the sodium benzoate will always show as white flakes. The only way to avoid this is to triturate the terpinol with a little calcined magnesia. [The use of magnesia as an excipient is to be condemned because it forms insoluble and non-disintegratable masses.—Editor THE DRUGGISTS CIRCULAR.] Add the heroine and the extract and then the benzoate dissolved in a few drops of water. The resulting mass has a homogeneous brownish color without any traces of the flakes of the benzoate.

It is an easy matter for the dispensing pharmacist after compounding ingredients of an incompatible nature to dispense the mixture as it is, attaching a

"shake" label; or he can pass the mixture through filter paper or absorbent cotton, thus securing a clear mixture. If he sends out the mixture in its chemically changed form, with the "shake" label, he is not giving what the doctor ordered; and if he filters, then he is not only fooling himself, but the patient as well. "Shake" labels should only be permissible when one or more of the ingredients is insoluble in the vehicle. None should sanction the filtering out of prescribed insoluble ingredients. Rather is it more desirable to suspend the insoluble ingredients with the aid of an emulsifier to secure uniformity, especially of dosage.

Another very important point for the pharmacist to remember is that, while the physician is the direct intermediary and aid to the patient, the pharmacist is the aid to both the physician and the patient; and if there is any doubt as to the efficacy or validity of a prescription it is the duty of the pharmacist to be where the physician can communicate with him at any time. This is emphatically borne out by an experience I had the same morning I was preparing this paper. The prescription in question called for the following ingredients:

IX.

Oleoresin of aspidium..... 4 c.c. (mils).
Oil of turpentine..... 2 c.c. (mils).
Castor oil..... 60 c.c. (mils).

Direct: To be taken at one dose.

In some European countries the dispensing of this combination is prohibited by law, and it is unlawful to dispense oleoresin of aspidium in any mixture with castor oil. [Aspidium is of itself dangerous (see below), the oil merely enhances its toxicity.—Editor THE DRUGGISTS CIRCULAR.] In prescribing oleoresin of aspidium, Poulsson recommends that oily substances be avoided because they dissolve the filicic acid, one of the poisonous constituents of the oleoresin, and thus promote its absorption. It is certainly suggestive that in many cases of poisoning with aspidium, castor oil has been prescribed along with it or soon after. Prof. Cushing in his *Action of Drugs* says: "Where large quantities of the drug [aspidium] are absorbed, grave and even fatal symptoms may ensue. These consist in vomiting, purging, acute pain in the abdomen, muscular weakness, somnolence, twitching of the muscles, convulsions, coma and death. In some cases jaundice is caused and in others permanent or temporary blindness has resulted from neuritis and subsequent atrophy of the optic nerve."

Prof. O. Everbusch, of Erlangen, Germany, cites a case of poisoning with this drug. A youth of twenty years of age, thinking he had tapeworm, took a preparation, already prepared as a household remedy, containing 10 parts of aspidium and 90 parts of castor oil. Immediately he developed a violent headache and nausea, and fell into a sleep lasting thirty-six hours. On awakening he was totally blind. Examination showed that he was suffering from optic neuritis and contractions of all the blood vessels of the optic nerve and retina. There also developed albuminuria of a severe type which, however, disappeared in the course of a few days. All known remedies were applied, but were of no avail, and he remained totally and permanently blind from optic neuritis.

From these facts I deem it proper to bring to the attention of pharmacists the expediency of cautioning the prescriber in cases where castor oil and oleoresin of aspidium are to be used together, and advise him to have them taken at a considerable interval.

I take pains in relating these cases because I feel that we as pharmacists can often avoid serious results of this nature; and if we are prepared in advance, and ready to meet the emergency when it presents itself, we can do much for the good of humanity.

Another very important matter that has come to my attention was a case in which a patient almost died as a result of an improperly prepared compressed tablet. I will quote from a reference to the Woodbridge treatment of typhoid fever, in a paper on "Important Therapeutic Indications in the Treatment of Typhoid Fever," by Dr. J. B. White, printed in the *New York Medical Times*. The Doctor said:

The best manner of giving the remedies is in tablet triturates. When properly made the tablets are so friable that they can be easily crushed between the fingers. If they are not made so that they can be readily assimilated, the result of treatment will not, of course, prove as expected, and I apprehend that this explains the failure of certain trials of the treatment in some hands.

The preparation of the tablets is a much more important matter than would appear at first thought, for if they should not be readily soluble they will not be dissolved in the stomach and intestines, but be expelled with the dejecta, their presence occasioning a degree of irritation proportionate to the number taken and their hardness and insolubility. I have seen this happen in more than one case, and the fever prolonged in consequence. As soon as tablets of proper make were given, however, the fever declined and the intestinal condition was as promptly relieved.

. . . . J. I., aged seventeen, was taken ill with typhoid and progressively grew worse. After being under treatment for a week . . . I advised a careful inspection of the dejecta and discovered a large number of undissolved tablets. It was subsequently found that these tablets were made with calcined magnesia as an excipient, and they were as hard as marbles. When other tablets were obtained from another source and given with the usual frequency the fever rapidly declined.

The following is an example of a tablet representing the Woodbridge treatment:

X.

Guaiacol, carbonated..... 2 grains.
Menthol 1/8 grain.
Eucalyptol 1/8 grain.

Make a tablet, dispense twenty-four.

These tablets can be easily made by granulation and gentle compression. They are very friable and easily crushed in the hands.

In conclusion, I wish to state that druggists should use their powers of discretion, their best judgment and most complete technical ability in dispensing, coupled with the best drugs obtainable and with the greatest amount of care. Under-graduates should not be given complete charge of the prescription department; nor should graduate pharmacists who lack technique and practical experience. With this in mind the pharmacist's work will bear fruit and he will be assured the confidence of the patient and the physician.

Oleoresin of Pinus Insularis.

Brooks (*Philippine Journ. Sci.*) has examined the oleo-resin of pinus insularis and finds that the oil has a specific gravity of $30^{\circ}/30^{\circ}=0.8593$, refractive index 1.4656 at 30° , and optical rotation $+26.5^{\circ}$. Not less than 96 per cent. distils between 154° and 165.5° . In five other samples the optical rotation varied from $+13.15^{\circ}$ to $+27.48^{\circ}$. The resin was found to contain over 90 per cent. of abietic acid.

Keeping Lime Water.*

Owing to the fact that lime water absorbs carbon dioxide from the air which precipitates the calcium as carbonate, it soon loses its strength.

Lime water should not be kept in too warm a place, as calcium hydroxide is more soluble in cold than in warm water; for example, a saturated solution of

APPARATUS FOR KEEPING
LIME WATER.

calcium hydroxide at 25° C., contains about 0.14 per cent., while at 15° C. it will contain about 0.17 per cent.

In the keeping of lime water, we would suggest that druggists make up quantities of 10 gallon lots, or more.

Then take a bottle or carboy that will hold, say 5 gallons, and place it on a shelf of suitable height, and arrange it as shown in the accompanying diagram.

It would be well to have two bottles of this size, one to be used to prepare the solution in, while the other one contains the finished product. Allow the

undissolved calcium hydrate to settle before changing bottles and connecting with syphon.

The turned up end of the tube (see diagram), prevents disturbing the sediment when siphoning off the lime water.

The tubing can be bent to any angle by heating to redness in gas or alcohol flame, and the carbon dioxide trap can be made out of an ordinary wide-mouthed bottle partly filled with a strong solution of sodium hydroxide; or, soda lime may be used.

After filling the outlet tube by suction, the liquid in the bottle may be siphoned out as wanted by opening the stop-cock at the lower end of outlet tube. The rubber joint prevents breakage of the tube by rendering it less rigid.

Sunday Closing.

The attitude of the public is in the main favorable to shorter hours for druggists as well as for other bread winners, according to Richard H. Lackey, who read a paper on the subject at the 1910 meeting of the Pennsylvania Pharmaceutical Association. Those druggists who have been most reluctant to join with their fellows, have been the most surprised that the plan could be so easily carried out and are now among those who are the most ardent to continue it, he says, referring to experiments which had been made in the northeastern part of Philadelphia.

Mr. Lackey states that the loss of receipts is no doubt compensated for in the greater spirit in which the druggist or his clerk can enter into his duties, because of the increased opportunity for rest or relaxation. "No one has claimed that his receipts for the year have fallen off, because of the fewer number of hours his store was open on Sunday," he reports, adding:

"Speaking generally on the subject of Sunday closing and shorter hours, I believe that one of the principal reasons for the dearth of good clerks can be found in the hours the clerk is expected to serve in the drug business."

"Mind Your Own Business."

In a report as chairman of the Chicago Retail Druggists' Association's propaganda committee, O. Probasca introduced the expression "mind your own business," and enlarging upon the virtues which it enjoined, said:

If our finances reach a low ebb and we are forced to augment our resources, it will discourage the doctor from turning into a canned condensed apothecary, who can cure all cases from a weak appearing shelf of bottles and a stray assortment of tablets with which some culinary aborigine of the pot-and-kettle type of proprietary medication soaked him.

It will teach the druggist that when he is counter-prescribing he is only *nosing* instead of *diagnosing*, and that a pickpocket has more respectability than he will have in all eternity. It will teach him to keep his windows clean and eschew the "patent"-medicine man whose only motto is kill more, both profits and people.

Precaution in Handling Corrosive Liquids.

An English factory inspector suggests that where acids are being handled, goggles similar to those worn by motorists, and made of rubber and glass should be worn by the operatives. This suggestion is a good one for druggists, of course, as well as factory operatives, and equally applies to all corrosive liquids.

*From Bulletin No. 150, on "The Preservation of Drugs," issued by the Kentucky Experiment Station of the State University.

Abstracts

Bismuth Benzoate.

Godfrin (*Journ. pharm. chim.*) has examined a large number of samples of commercial bismuth benzoate and has found that none represented the true salt expressed by the formula $\text{Bi}(\text{C}_6\text{H}_5\text{CO}_2)_3$. He has worked out the following process by which the true salt can be obtained: 6 grammes of bismuth nitrate are intimately mixed with 6 grammes of glycerin and 6 c.c. (mils) of water and the mixture stirred until solution has taken place. This solution is added at once to a solution of 6.2 grammes of sodium benzoate in 6 grammes of glycerin and 12 c.c. (mils) of water. The mixture is then well triturated to remove any lumps which may have formed, and when homogeneous it is mixed with constant stirring with two or three successive portions of 80 c.c. (mils) each of a 0.2 per cent. aqueous solution of benzoic acid. The mixture is then allowed to crystallize at a temperature of 10 to 15° C. for five to ten days, after which time the crystals are collected on a filter, preferably with the aid of a suction pump, washed three times with the above benzoic acid solution and finally dried either over sulphuric acid or at a temperature not exceeding 60° C.

Color Reaction of Caffeine.

Armani and Barboni (*Soc. chim. ital* through *Rép. de pharm.*) recommend the following reaction for the identification of caffeine. One or two milligrammes of the substance are boiled with caustic potash solution for two or three minutes and mixed after cooling with Welman's reagent, obtained by dissolving 3 grammes of sodium phosphomolybdate in 100 grammes of water and mixing with 20 c.c. (mils) of nitric acid, until a white precipitate is formed. By the gradual addition of a 50 per cent. potassium hydroxide solution, the precipitate is redissolved and the solution acquires a blue color. After a few hours, a blue precipitate will be formed and the solution will be decolorized. A similar, but not as distinct a reaction, is obtained by using Moseigne's reagent, which is prepared by dissolving 10 grammes of sodium tungstate in 100 grammes of water and 5 grammes of phosphoric acid (sp. g. 1.13), and acidulating the solution strongly with hydrochloric acid.

Mastic Dressings.

Oettingen states (*Journ. pharm. chim.* through *Pharm. Journ.*) that he employed mastic dressings largely during the Russian-Japanese War. He remarks that he never cleaned the wounds, considering the process to be dangerous in certain cases. He had always contented himself with painting on with a brush a liquid composed of mastic, 20 grammes; chloroform, 50 grammes; linseed oil, 20 drops, which prevents the development of bacteria. A dressing is afterwards prepared with a piece of muslin, fourfold, between the folds of which is placed a layer of cotton wool. It is sufficient to apply this dressing on the coating of mastic painted on the wound, and it adheres easily. These dressings are prepared beforehand, and about forty or fifty are sterilized together, taking care to surround them with parchment paper, and closing the packages very carefully when they are removed from the sterilizer.

Unlabeled Poisons.

Jackson (*Journ. Am. Med. Asso.*) calls attention to a danger that has not been sufficiently recognized. He has had under observation four little children threatened with starvation because of cicatricial esophageal stenosis due to the swallowing of some form of caustic alkali. Stricture from the swallowing of commercial lye has long been observed, but has been less frequent since the decline of home made soap, but "concentrated lye" is still in extensive use and the market is flooded with proprietary cleaners and washing powders for household and laundry use. The author has seen three cases of the most severe ulceration and sloughing of the esophagus due to these proprietary preparations. In one case the child swallowed the rinsings of the almost empty can. In another case, the cleansing powder had been sprinkled on the dishes in the dish pan and not sufficiently removed by rinsing, and in a third case the child drank some water from a cup which had been used for measuring out washing powder for laundry use. On not one of the containers of these widely advertised preparations was there any mention of their dangers or of antidotes to be used. On the contrary, the misleading statements as to the harmlessness of the preparations are on every package and in every advertisement. He brings up the subject with the hope that the same laws that apply to the drug manufacturer in regard to the compulsory labeling of poisons may be extended to the manufacturers of these proprietary preparations also. Considering the cosmopolitan character of our population, especially our domestic servants, the caution label should be in many languages. He advises his readers to inspect their own kitchens and find whether or not caustic alkalies are used with reckless disregard of their poisonous nature.

Purpura from Benzol Poisoning.

Selling reports (*Bull. Johns Hopkins Hosp.* through *Am. Journ. Dermat.*) several cases of purpura hemorrhagica occurring in a factory in which benzol was extensively used as a solvent. In all the cases, two of which proved fatal, the most remarkable feature was the blood condition, and this can be best described as the picture of a plastic anemia. In common with this were: (1) The presence of only slight changes in the appearance of the red blood cells; (2) the absence of regenerative forms (in stained specimens of the two fatal cases, only one megaloblast and monoblast were found); (3) scantiness of platelets; and (4) diminution of the granular types of white blood cells, with a relative increase in the mononuclear elements.

Caution Regarding an Olive Oil Test.

Marcille (*Ann. Falsif.* through *Chemist and Druggist*) has examined a large number of Tunisian olive oils, and confirmed previous observers' statements that many of these oils give a distinct reaction with Bawduin's reagent (furfuraldehyde and hydrochloric acid), which is usually attributed to the presence of sesame oil. An experienced observer can, however, discriminate between the colors developed, and a bald statement that olive oil shall not yield any red coloration with this reagent will exclude many pure samples of oil.

Delicate Test for Glue.

Schmidt (*Chem. Zeit.*) finds that if a solution of ammonium molybdate acidified with nitric acid be added to a solution of glue, and followed by a little dilute nitric acid, a white precipitate is formed which is amorphous and heavy, quickly falling to the bottom, and leaving a clear liquid. Gum arabic, linseed mucilage and egg albumin do not give such a precipitate, but only a slight turbidity even when strong solutions are employed. If 1 milligramme of glue be present in 5 c.c. (mils) of the liquid tested, a considerable precipitate falls at once; if only half this proportion is present, a precipitate will be found to have formed after about an hour; and if only 0.00001 gramme of glue be present in 2½ c.c. (mils) of liquid, a distinct turbidity is still formed. This reaction may also be used quantitatively; the reagent is made by dissolving 3 grammes of ammonium molybdate in 250 c.c. (mils) of water, and adding 25 c.c. (mils) of dilute nitric acid of specific gravity 1.2; sufficient of this is added to the glue solution, the precipitate is washed with water acidified with nitric acid, at first by decantation and then on the filter, until nothing further is removed, then dried on the previously tared filter and weighed. The specimens of results given show that the figure obtained is usually about 5 per cent. too high.

Flashlight Powder.

A quick firing, strongly actinic flashlight powder for photographers recommended by Lumière and Seyewetz (*Photog. Journ.*) is made of powdered magnesium (finely sieved), 2 parts; and potassium perchlorate, 1 part, mixed on a paper with a feather, or a piece of cardboard. Aluminum may be used instead of magnesium, but the metal must be in impalpable powder, otherwise it is very difficult to start combustion. The aluminum must be so finely divided that it adheres so readily to the vessels in which it is contained as to coat them with a brilliant film. The screens to be used with these powders should be of a greenish-yellow color. Such a powder should be mixed only as wanted, being too dangerous to be stored.

The Ferments of Honey.

Natural honey contains several ferments with diastatic, proteolytic and inverting properties, on which, it is said, the nutritive value of honey largely depends. These ferments are destroyed when the honey is heated to 70° C., and naturally are not present in an artificial product. Auzinger (*Bull. ass. Chim. through Ann. d. Falsif.*), therefore recommends to examine honey not only for its physical properties, but for the presence of enzymes also.

Kromayer's Quartz Lamp in Eczema.

Rave (*Archiv. f. Derm. u. Syph., through Brit. Journ. Dermatolog.*), says that this lamp has been found to be extremely useful in curing stubborn eczematous patches which resist the usual treatment, and do not even respond to the x-rays. In pustular eczema, especially of the head and chin (sycosis), and also in chronic infiltrated eczemas, the treatment is effectual, but of the three types mentioned the first responds most readily to it.

Banana Flour as an Infant Food.

Pritchard (*Brit. Med. Journ.*) says that he has for many years recommended the addition of mashed banana to the milk mixtures given to bottle-fed infants. Now he proposes the use of banana meal made into a gruel or decoction instead of the proprietary infant foods. It is of great importance that infants should be trained early to digest cow's milk. This cannot be done by giving them artificial substitutes which are predigested. The use of cereal decoctions and solution of gum or gelatin undoubtedly makes the digestion of cow's milk easier, says the author and he finds that a decoction of banana gruel has many points to recommend it. It can be made quickly by rubbing up a heaped tablespoonful of banana flour with a pint of water, and then boiling for five minutes. A gruel made in this way has excellent colloidal properties when added to cow's milk in equal quantity; it thickens the milk and prevents the formation of the tough curd of casein, and satisfies the appetite of hungry infants more effectually than simple milk dilutions.

Delicate and Stable Litmus Solution.

Püschel's method of purifying litmus (*Oesterr. Pharm. Zeit. through Pharm. Journ.*) consists in treating an aqueous solution with 4-per cent. sulphuric acid, whereby a dark, brown-red precipitate is thrown down consisting, it is supposed, of a sulpho-nate of the violet coloring matter, while the other bodies present remain in solution. By filtering and washing the precipitate with cold water, the substance is obtained in a pure condition; it is dissolved in hot water, and neutralized with solution of potassium hydroxide. In this way a litmus solution of great purity, stability, and delicacy is obtained.

Quality of Zinc Dioxide.

Lemaire (*Rép. Pharm. through Pharm. Journal*) examined 15 samples of zinc dioxide. The best of the lot contained only 40.9 per cent. of ZnO₂; the worst, but 11.15 per cent. The author did not, however, come across any sample which contained no available oxygen. Vanverts, on the other hand, has met with some which were merely ordinary zinc oxide. To test the dioxide, 20 cgm. was dissolved in 10 c.c. (mils) of 10 per cent. sulphuric acid and titrated with N/10 permanganate, each c.c. (mil) of which thus used up would be equivalent to 2.425 per cent. of ZnO₂ in the sample.

Coloration of Poisonous Solutions.

Hibonneau (*Gaz. Méd. through Pharm. Journ.*) notes that corrosive sublimate solution is sometimes colored, and sometimes not, as is also the case with Van Sweiten's liquor in the French Pharmacopœia of 1908, which should be colored equally with other solutions containing this toxic principle. He regrets that solutions containing 1 in 100 or 1 in 4,000 should show the same coloration. Blue is the color recognized by the public doctors and pharmacists, and methylene blue is recommended instead of indigo blue. It is proposed to color the solutions with methylene blue in quantity proportional to the sublimate present, adopting the standard of 2 milligrammes of coloring matter to a liter of 1 in 1,000 solution.

Adulterated Star Anise Oil.

Parry reports in the *Chemist and Druggist* that adulterated star anise oil has recently been found in the London market. A number of parcels examined had the following characters: Specific gravity at 20°, 0.9575 to 0.9740; refractive index at 20°, 1.5460 to 1.5475; melting-point, 12° to 15°; congealing-point 10.5° to 12°; optical rotation, 0° 15' to +0° 35'. It will be noticed, says the author, that the specific gravity is abnormally low, and does not correspond with pharmacopoeial requirements, while the melting and congealing points are also very low. The refractive index is lower than he had ever found for pure aniseed oil, which has a value between 1.5520 and 1.5580 or thereabouts. The slight dextro-rotation indicates nothing, as some samples of pure star anise oil are faintly dextro-rotatory. A bulked sample made from a number of those examined was fractionally distilled as was also a sample of pure oil. All the intermediate fractions had lower refractive indices and lower melting points than the corresponding fractions of the pure oil, and the amount distilling between 225° and 235° was only 69 per cent., against 87 per cent. for the pure oil. The residue of 20 per cent. was less soluble in alcohol than the corresponding fraction of pure aniseed oil. The color of the adulterated oils was characteristic, and quite different from that of pure oil. The most probable adulterant is some fraction of camphor oil.

Cherry Laurel Water with Alkaloidal Salts.

Cherry laurel water made in porcelain containers, it is said, never produces precipitates when mixed with solutions of morphine hydrochloride. Mythenaere (*Bull. Comm.*) has found that precipitates are produced by traces of copper, with which commercial cherry laurel generally is contaminated. He therefore recommends redistilling the latter in glass containers before mixing it with the solutions of alkaloidal salts.

Gelatin and Hardening Substances.

Lumière and Seyewetz report (*Brit. Journ. Photog.*) a number of experiments having to do with the degree of impermeability of gelatin produced by various hardening substances. To a hot 10-per cent. solution of selected gelatin were added increasing proportions of solution of formaldehyde, quinone, quinone-sodium sulphonate, chrome alum, and potash alum. All these substances, with the exception of the ordinary quinone, which is sparingly soluble in water, were used in 20-per cent. aqueous solution. Quinone was used in 5-per cent. solution in alcohol. In each experiment the gelatin solution, to which was added the different quantities of the hardening solution, was further diluted with water, so as to bring each solution to a standard strength of 7-per cent. gelatin. Thus, for 100 c.c. (mils) of 10-per cent. gelatin solution a further 42 c.c. (mils) of liquid were added, consisting of water, and the 20-per cent. solution of the hardening substance. The respective quantities of the different hardening substances which can be present in 100 c.c. (mils) of 7-per cent. gelatin solution without reducing the fluidity of the solution are given in a table. The following are the conclusions drawn: (1) The substances which render

gelatin insoluble diminish also its permeability. (2) The various hardening substances which may be added to gelatin solution, without interfering with its fluidity, may be classified in a decreasing order of their effect on the solubility of gelatin thus: Formaldehyde, quinone-sodium sulphonate, quinone, chrome alum, potash alum. Potash alum, which does not render gelatin really insoluble, but only diminishes its fluid properties, has a considerably weaker action than the other hardening agents. (3) Although formaldehyde has more marked hardening properties than quinone and its sulphonic derivative, and does not, as do these, color the gelatin red, it is better to use the latter in all cases where the gelatin is supported by a rigid body, because formaldehyde produces contraction of the gelatin, which tends to detach the film from the support. (4) Quinone and its sulphonic derivative may be employed in much stronger proportions than formaldehyde without interfering with the fluidity of the gelatin solution, and are therefore preferable, though possessing lesser hardening properties.

Grave Dangers of "Optometry."

Janeway (*Journ. Am. Med. Asso.*) reports a striking instance of the dangers of allowing opticians to prescribe for eye troubles. A man consulted him regarding a severe and increasing headache from which he had been suffering during three months. Some weeks before he had been to one of the large optical houses because of some trouble with his eyesight, and had glasses prescribed for him by an "optometrist." He did not have a refractive error of consequence, but a high grade of choked disc in both eyes and was suffering from brain tumor. "Of course," says the author, "a decompression operation three weeks ago would have preserved much more sight than can be expected now." The author places blame for this loss of valuable time on the legal recognition of optometrists in this State. "No person," he adds, "should be recognized by law as competent to treat disease until he has been thoroughly trained in the science of diagnosis. This, for every specialty, no matter how small, as a minimum training, the present course of instruction in the whole of medicine required of candidates for license as physicians. No part of the human body can be arbitrarily separated from its vital connection with the whole organism."

The Supposed Conversion of Calomel.

Schaefer (*Med. Press*) says that the belief that the gastric juice, the alkaline chlorides, and certain acidulous drinks convert calomel into corrosive sublimate is erroneous. A number of quantitative and qualitative chemical experiments seem to prove his contention and additional evidence collected as the result of investigations made on animals confirm the view. It appears to be established that calomel is not converted into corrosive sublimate, but is decomposed by the alkaline secretions of the small intestine and pancreas, to form the gray, black, and red oxides of mercury, which are soluble in the alkaline fluids. It has been also supposed that when calomel is vigorously triturated in a mortar for some time with white sugar a trace of corrosive sublimate is formed, occasioned by impurities with which it is liable to be contaminated. In this instance, also says the author, no free corrosive sublimate is produced.

The Modern Materia Medica.

Alcola, a preparation exploited for the treatment of dipsomania, consists of three kinds of tablets which, according to Mezger contain respectively (1) milk sugar, caffeine and strychnine; (2) milk sugar, ferric oxide and strychnine; and (3) tartar emetic, calcium, magnesium, sulphuric and hydrochloric acid and traces of ferric chloride.

Capsulæ Laxativæ, Foelde, are said to contain castor oil, croton oil and the extracts of aloes, jalap and cascara sagrada.

Digestin is a digestive ferment prepared in Japan from the okazaki fungus. It is a fine yellow powder and is said to possess powerful digestive properties, acting on milk, fibrin and starch in acid, alkaline and neutral solutions.

Dorema, exploited as a remedy for "strengthening the nerves" is said to contain gluten, milk sugar, sodium bicarbonate, lecithin, hemaglobin, iron glycerophosphate, calcium and magnesium salts, and powdered cocoa.

Eleptin is another name for *epileptin*.

Epithelisierungsbinden (bandages) is another name for epidermol bandages.

Ergoxanthin is a new active principle of ergot. It is said to have a powerful influence on the blood-pressure.

Eubelein is the name of a new cholagogue. It is prepared from gall rich in glycocholic acid and is marketed in the form of capsules.

Guaiaicolin is a syrup of guaiacol containing 5 per cent. by volume of the latter.

Hycol is described as a "diluted tar product containing 38 per cent. of phenoloids." It is exploited as a disinfectant.

Hyposarcine is said to be an extract of the muscles of horses and occurs as a palatable syrupy liquid.

Kresosteril is said to contain m-cresol-o-oxalic acid ester. It is marketed in the form of tablets consisting of 70 per cent. of cresol and 30 per cent. of oxalic acid. It is offered as a disinfectant.

Lecimorol is phosphorated cod liver oil with lecithin.

Leucocedin contains tannic acid (kino) and alum.

Maltropon is a combination of the albumin *tropon* with malt and lecithin. It occurs as a brownish liquid.

Mencedin is the name of tablets said to contain fluid extract of golden seal and cotarnine.

Medicoizal is a 40 per cent. solution of purified izal. (Izal is a preparation similar in composition to compound solution of cresol.)

Nervifirmit is said to be similar in composition to *dorema*. (See above.)

Omnopon is the English name for *pantopon*, a preparation of the opium alkaloids.

Plantaginol Baur, exploited as a remedy for whooping cough, is said to contain codeine phosphate, potassium guaiacolate, bromides, syrup of ipecac and "honey of plantain."

Rella-Tee is another name for *species rosella*.

Riba is an albumin preparation prepared from

fish. It occurs as a greyish hygroscopic powder, consisting, it is claimed, chiefly of albumoses and almost free from purine bases, creatinine, etc.

Salzberg Schwegel Schlamm (sulphur mud) occurs as a gray powder uniformly miscible with water. It is put forward as a medium for absorbing exudates.

Sanguifer is said to contain iron peptonate, calcium glycerophosphate, kola, and cinchona.

Thrasaetus, exploited for the treatment of rheumatism and gout, is said to contain oil of eucalyptus, oil of juniper, olive oil, horse-marrow and camphor.

Undinol, used for preparing medicated baths, is said to be a soap solution, free from alcohol and containing oils and extracts of coniferous plants.

Veril is an anthelmintic in the form of tablets, which contain areca nut.

Vocalin are tablets said to contain extract of licorice, sugar, and traces of oil of peppermint.

Clear Lime Mint Drops.

Crystal A sugar.....	2 pounds.
Cream of tartar.....	1 teaspoonful.
Tartaric acid.....	2 ounces.
Oil of lime.....	1 ounce.
Oil of peppermint.....	½ ounce.
Chlorophyl	enough.

Mix the sugar, the cream of tartar and the water in a suitable pan. Put the pan on the fire and stir the batch until the sugar is dissolved; cook to 335° F.; pour the batch out on a greased marble slab and allow it to cool. Work in the color, the acid, and the oils. Fold the batch over and over again until it becomes homogeneous in color and is cool. Cut into drops of the required size.

Chicken Tonic.

In Britain the agricultural officials and experts are testing their theory that the addition of mineral salts to the food of chicks lessens the mortality and increases their development. According to the *Journal* of the board of agriculture this is the accepted mixture:

Sodium chloride.....	30 parts.
Sodium phosphate.....	9 parts.
Calcium fluoride.....	1 part.
Ferrous sulphate.....	1 part.
Bone-ash	30 parts.
Chalk	14 parts.
Magnesium sulphate.....	10 parts.
Charcoal	2 parts.
Sublimed sulphur.....	3 parts.

Methylene Blue Paste.

The *Deutsche medicinische Wochenschrift* gives the following formula for methylene blue paste oftentimes prescribed by dermatologists:

Methylene blue.....	2 grammes.
Zinc oxide.....	12 grammes.
Bismuth subnitrate.....	12 grammes.
Petrolatum	12 grammes.
Wool-fat	30 grammes.
Distilled water.....	15 c.c. (mils).

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Emulsion of Iodoform.—A. B. R., New York.—Generally speaking the so-called "emulsions" of iodoform used in orthopedic practice and (diluted) in cystic affections are suspensions of the drug in glycerin. Many formulas are extant, although the simple mixture of 1 part of iodoform and 9 parts of sterile glycerin is doubtless entirely satisfactory for injection into sinuses; for use as a bladder antiseptic it should be diluted with about 40 parts of sterile warm water.

The following formulas, the second of which gives a preparation somewhat emulsion-like, are from the British Pharmaceutical Codex:

I.

Iodoform in fine powder..... 10 grammes.
Glycerin 70 c.c. (mils).
Distilled water..... 20 c.c. (mils).

Rub the iodoform to a smooth paste with the glycerin, and add the distilled water.

II.

Iodoform, in fine powder..... 10 grammes.
Alcohol 2 c.c. (mils).
Tragacanth, in powder..... 1 gramme.
Distilled water enough to make 100 c.c. (mils).

Rub the iodoform to a smooth paste with a mucilage prepared by mixing the tragacanth with the alcohol and water.

Squire's Pharmacopœias of the London Hospitals gives six formulas in use in eight medical institutions. The directions at the Royal Chest Hospital are to sterilize the iodoform by soaking it in a 1-in-20 solution of phenol; decant the fluid; and shake the iodoform with the previously sterilized glycerin.

A mixture of iodoform introduced by von Mosetig and once largely used in this country and Europe as a bone plug is known as Moorhof's bone wax. It has the following formula:

Iodoform 20 parts.
Spermaceti 40 parts.
Sesame oil..... 40 parts.

Heat the ingredients together slowly to 100° C., and allow the mixture to cool while stirring. For use it is heated to 50°.

A Difficult Pill.—G. W. M., California, has had difficulty in finding a satisfactory excipient for a pill made according to the following formula:

Powdered opium..... 5 grains.
Powdered camphor..... 8 grains.
Phenyl salicylate..... 24 grains.

Mass and divide into eight pills.

He has used compound tragacanth powder, but this makes the mass too bulky.

We have experimented with powdered licorice, soap, kieselguhr, cacao butter, and several other excipients, alone and in various combinations, but have been unable to make a pill much less than one-fourth of an inch in diameter. We have two suggestions

to make: One is that the querist try to induce the prescriber to permit the mass to be dispensed in capsules; the other, that he experiment with the following mode of procedure:

Triturate the phenyl salicylate with the camphor until a homogeneous oily liquid is obtained; mix this intimately with 20 grains of Roe's excipient, melted; beat in the powdered opium; allow the mass to stand for a time and stiffen it with a mixture of licorice and compound tragacanth powder.

In manipulating masses of this sort, time is a factor too often overlooked. A fresh mass made with compound tragacanth powder, and entirely too soft to handle, will, after standing a while, acquire a workable stiffness.

Roe's excipient is made as follows:

Soak 4 drams of gelatin in warm water for a few minutes; drain it and put in a suitable vessel with 1½ drams of glycerin. Heat on a water bath until melted; then stir and bottle.

The Best Nostrums for Certain Troubles.—M. D. C., Hawaii, sends the following naïve request:

In the interest of a suffering public we desire to obtain from you information as to the highest class and most efficacious cure for the disease of asthma, and the name of the firm or house who manufactures same, with the purpose of securing the sole agency of the remedy for sale in this Territory of Hawaii.

Also an emmenagogue which has stood the test of clinical experience and recognized as the standard.

Trusting to receive this information at your hands at earliest convenience, and thanking you in advance for humanitarianism."

We are sorry to have to say that we are unable to supply the desired information, and the reason for our inability should suggest itself to any druggist who gives the matter serious thought for a few moments.

Asthma is a manifestation which frequently baffles the skill of the best physicians who are called upon to treat patients suffering with it, and perhaps no two cases should be treated exactly alike, for not only the varying phases of the disease itself, but the idiosyncrasies of the patient must be taken into consideration if the best effect is to be obtained. If, then, a competent physician who is familiar with the case and sees the patient from time to time and uses his best judgment in varying the treatment as necessity arises, does not always get results which are satisfactory to all concerned, how can it be possible for some nostrum manufacturer who has never seen the sufferer and knows nothing about the peculiarities of his case, to be able to prescribe a single remedy which will fit it and thousands of others partly like it and partly different?

The same question might be asked with at least as much if not even greater propriety concerning the other remedy requested and the complaint for which it is to be used.

"In the interest of a suffering public"—which has already suffered too long at the hands of nostrum manufacturers whose principal asset is public ignorance—we suggest that druggists use their influence to send sufferers from asthma and other ills to those who are legally authorized and presumably professionally equipped to diagnose their cases and prescribe remedies for their relief. The man who undertakes to diagnose and prescribe when he has not completed a course of study which entitles him to legal

recognition as an expert in the practice of medicine, thereby becomes a quack and may justly be regarded as a faker; and his status is not changed by his surroundings, no matter whether they be the luxurious fittings of a suite of offices in a large manufacturing establishment, rows of bottles over a prescription counter, or the gaudy trappings of a mountebank's cart at a county fair.

Banana Liquid and Gold and Aluminum Paint.

—H. F. A., New York, wants a formula for banana liquid such as is used for a vehicle for gold, aluminum, etc., in painting, and a liquid for the same purpose but devoid of the disagreeable odor of the former.

Information on this and a thousand other subjects of interest to painters and dealers in paints, is contained in a book entitled *1,000 More Paint Questions Answered*, published by *The Painters Magazine*, this city, and sold for \$3. In this book we find two ways for making banana liquid set forth, the first one of which is as follows:

One pound of gun cotton is dissolved in 1 gallon of acetone, and to that solution is added 2 gallons of amyl acetate and then 2 gallons of benzin. Of course no druggist should undertake the manufacture of such a preparation until he has taken all the life, accident and fire insurance he can get, put his business in good order, forgiven his enemies, and made his will; that is, unless he is especially equipped for the undertaking.

In making the gold or aluminum paint, about a pound of gold bronze or $\frac{1}{2}$ pound of aluminum bronze is used to the quart of the liquid.

To make an aluminum paint without the use of banana liquid place in a suitable vessel 4 ounces of finely powdered magnesium carbonate and 2 quarts of best pale coach varnish. Stir well, and gradually add 7 quarts of oil of turpentine. This is best done on a water-bath. After the mixture has cooled and the magnesium salt has settled, decant the liquid and stir in the aluminum bronze, in the proportion of about 6 or 8 ounces to the quart.

White Paint for Golf Balls.—S. D. C., Nebraska.

—One of the points of superiority claimed for their wares by several of—if not all—the makers of golf balls is permanency of coloring. From this we take it that the making of a suitable paint is somewhat more difficult than is the compounding of white-wash. The writer's acquaintance with the sprightly "gowf baul" does not embrace a knowledge of the ingredients of its "complexion;" however, we have seen the following formulas put forward as representing the coat that makes the golf ball visible:

I.

Celluloid enough.
Acetone some.
Zinc oxide.....the required quantity.

Dissolve in some acetone enough celluloid to make a varnish; color this with sufficient zinc oxide.

II.

White lead, ground in oil..... 1 part.
Zinc white, ground in oil..... 1 part.
Ultramarine blue..... enough.
Coach varnish (without drier)..... enough.
Mix the pigments, and thin them to the desired con-

sistency with the varnish, adding a little ultramarine blue to neutralize the yellow tint of the coach varnish.

No drier should be used in these paints as it destroys the elasticity of the film and lessens its wearing properties.

Carbona.—H. W., New York.—We do not know the composition of this preparation, but suspect it to consist largely of carbon tetrachloride. Various notes on the uses and dangers of the last named liquid have appeared in the CIRCULAR during the past four or five years. This liquid is a non-inflammable cleaner, but one whose fumes (heavier than air) are said to be as dangerous as those of chloroform.

Here is a formula devised by a number of the CIRCULAR staff which has given satisfaction:

Non-Inflammable Clothes Cleanser.

Rosin soap.....	1 pound.
Common white soap.....	1 pound.
Potassium hydroxide.....	3 ounces.
Alcohol	8 ounces.
Carbon tetrachloride.....	5 pints.
Water	enough.

Melt the soaps together on a water-bath, adding to them a little water from time to time, as required. Dissolve the potassium hydroxide in the alcohol; add to this solution $1\frac{1}{2}$ pints of carbon tetrachloride, and incorporate the liquid in the soap mass, beating the whole with an egg beater. Transfer the pasty mass to a suitable bottle, add the rest of the carbon tetrachloride and mix the whole by agitation. The compound should at once be transferred to wide-mouthed bottles of the size desired for the market and these immediately corked tightly.

Sometimes a portion of the carbon tetrachloride separates from the "cream" on standing, but it can be incorporated quite easily by shaking before using.

In the CIRCULAR for October, 1910, pages 501 and 514, are notes on cleaning preparations which may prove of value in this connection.

Bijou Cleaning Fluid.—Herbert P. Harrison, Rhode Island, seeing the note on this subject in last month's CIRCULAR, page 634, is kind enough to send the following formula:

Ether	1 dram.
Chloroform	1 dram.
Alcohol	2 drams.
Oil of wintergreen.....	1 dram.
Benzin	2 pints.

This mixture is very inflammable and should be made and used with the utmost caution.

We thank Mr. Harrison for the information as well as for his kindness, and hope he will put us under further obligations to him.

Therox.—"Thymol," Ohio.—We do not know the composition of this preparation, but if it is one of the "fakes" of the "beauty specialty" class, it is a good thing for druggists to leave to the woman's department of the daily papers.

Insect Powder.—E. J. C., Pennsylvania.—Our understanding is that the powder you mention is simply ground pyrethrum flowers, but it has an odor which suggests hellebore to some.

Peterman's and Other Roach Foods.—T. M., New Hampshire.—As a result of analyses of Hooper's and Peterman's roach foods made by him and published in the CIRCULAR for October, 1889, page 219, Dr. R. G. Eccles stated that a typical formula for this class of preparation was:

Borax 37 parts.
Starch 9 parts.
Cocoa 4 parts.

Another formula which a member of the CIRCULAR staff has used in making a successful preparation, is:

Antimony and potassium tartrate.... 1 ounce.
Borax 4 ounces.
Powdered sugar..... 4 ounces.

Owing to the fact that this is quite poisonous to humans as well as to animal pets, its general use is not recommended.

Emmett Powers wrote to the CIRCULAR that in experimenting along the roach-destroying line, he found that a mixture of equal parts of insect powder and borax will destroy more roaches than any powder in the market, and will do its work in less time than the others take.

In the CIRCULAR for March, 1906, page 83, a contributor said that he had found the following combination the best:

Insect powder..... 1 part.
Borax 10 parts
Starch 1 part.

The starch, he said, made the powder stick to the body of the insect; the insect powder was the active ingredient; and the borax was a diluent, but of doubtful efficacy otherwise. The CIRCULAR took issue with him on the latter point, as borax alone has been known to be effective in ridding a room of roaches.

A different kind of formula in which a fluorine salt is exhibited, was contributed to the CIRCULAR some time ago by that successful manufacturing chemist and ingenious deviser of formulas, Dr. J. S. Brewer, who says that the fluorides have a peculiarly toxic effect upon the insect. It follows:

Silex 22 parts.
Sodium fluoride..... 40 parts.
Sodium chloride..... 10 parts.
Sodium carbonate, dried..... 5 parts.
Sodium sulphate..... 10 parts.

In the CIRCULAR for July, 1909, page 340, is an abstract of a government bulletin on roaches.

Miles' Nervine.—L. V. D., Missouri.—We do not know the formula of this preparation. Under "Appeals to Readers" we sought information concerning it last year, but without result. The only good that the possession of the formula would do a druggist, so far as we can see, is that it would put him into a better position to warn possible purchasers concerning the true nature of the preparation. To aid druggists who desire to perform this service we point to the decision of Judge Macfarland, of Pittsburg, rendered in the case of the Dr. Miles Medical Company vs. the May Drug Company. This decision appears in full in the CIRCULAR for April, 1906, page 143, and a note on the subject is given in the issue for July of the same year, page 278. The Miles people sought to enjoin the May company from selling certain of their goods, and the judge said, first, that "it seems

that the defendants should be enjoined but for other facts and conclusions of law." He then went on to say, secondly, that the advertisements of certain of the Miles goods were unlawful, and added:

Third: The false statements of the plaintiff bar its action.

Fourth: The business of the plaintiff is contrary to public policy.

This court decision ought to prove even more efficient as a deterrent to those who would buy the stuff than the formula, as the public can understand the meaning of what the judge said, while the formula of the medicine might be utterly unintelligible to them.

Elixir of Lactated Pepsin.—F. A. L., Florida.—Perhaps the most extensively "advertised" formula in the National Formulary is the one for compound digestive elixir, which is the formula for an elixir of lactated pepsin. The wide "advertisement" of this formula has grown out of the fact that pharmaceutical physiological chemists have said that the preparation is inert on account of certain incompatibilities in it, and members of the American Medical Association have called upon the American Pharmaceutical Association to delete the formula. Many pharmacists, on the contrary, have said that so long as physicians persist in prescribing such a preparation, inert or "therapeutic monstrosity" though it may be, the pharmacists want an official formula for it. The chemists' criticism applies to the proprietary elixirs as well as to the official one, and the latter is probably as good, or as bad, as the other kind.

Thirty-odd years ago Prof. Emil Scheffer read a paper before the American Pharmaceutical Association (see the CIRCULAR for March, 1877, page 52) in which he pointed out the incompatibility of pepsin, pancreatin, and diastase.

M. I. Wilbert, in a paper on the elixirs in the National Formulary (see the CIRCULAR for February, 1910, page 62), speaks fervently of "our own lack of development as pharmacists, of our inefficiency as scientists, of our inability to keep ourselves fully informed on the progress that is being made in other branches of the science of medicine."

Commenting on the particular elixir in question, John K. Thum (see the CIRCULAR for March, 1910, page 128) says that its formula should be retained in the National Formulary as the albuminoids it contains make certain salts administered with it more acceptable to the stomach. He recommends, however, that the therapeutic name of the elixir be changed.

Prof. W. L. Scoville (see the CIRCULAR for April, 1907, page 294) says of the compound digestive elixir: "Scientifically the mixture is absurd, and its use should be discouraged. The same is true of compound powder of pepsin."

Lactopeptine.

According to a published report of the council on pharmacy and chemistry of the American Medical Association, lactopeptine contains more than 90 per cent. of milk sugar, only small amounts of pepsin, no hydrochloric acid or mere traces only, and no diastase or pancreatin. It "corresponds to a weak saccharated pepsin," says the council, and "the claims made as to its therapeutic value are unwarranted, exaggerated and misleading." Speaking of this report the editor of the *Journal of the American Medical Association* says that it has been repeatedly demonstrated that diastase and pancreatin are destroyed by pepsin

in the presence of acid, and "that the manufacturer should have attempted to manufacture such an impossible product, and that the medical profession should have accepted it, is not creditable to either party concerned." What is true of lactopeptine is true of a number of other preparations made by manufacturing pharmacists which are intended to replace it.

According to the patent under which lactopeptin was manufactured, which patent has long since expired, it consisted of—

Sugar of milk.....	40 ounces.
Pepsin	8 ounces.
Pancreatin	6 ounces.
Vegetable diastase.....	4 drams.
Lactic acid.....	5 drams.
Hydrochloric acid.....	5 drams.

An elixir of lactopeptin may be made by dissolving 640 grains of this mixture in a pint of aromatic elixir.

Formulas for elixirs of lactated pepsin, offered as improvements on the official one, are given in the issues of the CIRCULAR for June, 1910, page 278; August, 1909, page 400; December, 1908, page 618; and March, 1908, page 125. One of these, by George M. Beringer, is as follows:

Compound Elixir of Pepsin.

Pepsin (soluble "scales or granular" variety).....	15 grammes.
Pancreatin	15 grammes.
Diastase	1 gramme.
Lactic acid.....	1 c.c. (mil.)
Hydrochloric acid.....	2 c.c. (mils.)
Glycerin	250 c.c. (mils.)
Alcohol	200 c.c. (mils.)
Oil of orange.....	2 c.c. (mils.)
Cudbear	1 gramme.
Water.....	enough to make 1,000 c.c. (mils.)

Mix the acids with the glycerin and 500 c.c. (mils) of water, add the pepsin, pancreatin and diastase, and macerate with occasional agitation until solution is effected. Then add gradually the alcohol, in which the oil of orange has been dissolved, agitating after each addition. Now add the cudbear and sufficient water to make the preparation measure 1,000 c.c. (mils). Macerate for six hours, with occasional shaking, and then filter.

The formula in our issue for last June does not call for pancreatin or diastase.

Cheap Soap Powder.—D. F. M., Indiana.—You will find a number of formulas for soap powder in the issues of the CIRCULAR for November, 1909, page 589; and March, 1907, page 270. One of these is repeated herewith:

Hard soap.....	5 parts.
Soda ash.....	3 parts.
Sodium silicate.....	2 parts.
Borax	1 part.

Miscibility of Cresol Solution with Water.—Ernest K. Rains, Illinois, referring to a note on this subject in the CIRCULAR for November, 1910, page 577, speaks with enthusiastic approval of the process for making a water-soluble solution of cresol described in a communication from Prof. G. L. Secord published in the CIRCULAR for June, 1910, page 281.

Is There Any Morphine in Opium?—F. G. E., New York, seems not to be satisfied with the note in last month's CIRCULAR, page 633, in reference to the sale of morphine in this city. The part to which he objects is the following paragraph:

As to the point raised by our correspondent that the ordinance prohibits the sale of preparations containing morphine but does not apply to preparations containing opium, we would say that it is unworthy of a boy who has been one year in the drug business; that is, unless F. G. E. assumes that in the manufacture of paregoric, brown mixture and the rest of the opium preparations, a gum is used from which the morphine has been extracted.

He now writes: "The question that the unworthy boy would like to get you to answer is—If opium has about 25 constituents each having a chemical formula resulting from the action upon it of chemical reagents, would like to know *can morphine be separated without adding a reagent to produce it.*" The question is here given exactly as he wrote it, punctuation, spelling and italics. At first reading it (the question itself) seems to be all right, but upon careful examination we find that it runs a close second to the late Coudrey bill, which no one could treat seriously. In its English construction it reminds us of a bill introduced in congress "to pension the surviving officers and enlisted men and their widows who served in the Indian wars." Just how surviving men could have widows and whether or not these widows served in the wars, the bill does not explain; and this query leaves us in doubt as to several things.

As near as we can gather from his question, F. G. E. wants to know whether or not morphine or any salt of morphine actually exists in opium as morphine or a salt of morphine. The Pharmacopœia states that opium "yields" morphine. This is non-committal, as a cow *yields* milk, which exists in the cow as milk, and the ground *yields* corn, which does not exist in the ground as corn.

The Standard Dispensatory, under "Morphine," says: "Morphine is the principal alkaloidal constituent of opium, in which it occurs both as sulphate and meconate"; and under "Opium," speaking of its alkaloids, it says: "It is now pretty well established that they exist in opium partly as sulphates and partly as acid meconates."

The United States Dispensatory, under "Opium," gives this information: "According to the views of its constitution at present accepted, it contains: 1. Morphine, $C_{17}H_{19}NO_3$," etc.

From the British Pharmaceutical Codex: "Morphine, $C_{17}H_{19}NO_3 \cdot H_2O$, is the principal alkaloid occurring in opium, in which it exists in combination with meconic acid (and probably also sulphuric acid) to the extent of from 4 to 20 per cent. or even more." And in another place: "It exists in combination with acids (meconic and sulphuric) in the form of salts readily soluble in water."

From Caspari's Pharmacy: "Morphine is present in opium in varying quantities. . . . It was formerly supposed to exist in combination with meconic acid only, but is now [1910] known to be present largely, if not altogether, as sulphate."

These authorities, and others, seem to settle the question in the affirmative.

Cleaning Fluid.—"Thymol," Ohio.—See the answer to H. W., New York, under the heading, "Carbena," on page 28.

Perfecting a Cold Cream for Commercial Purposes.—M. K., New York.—In the CIRCULAR for July, 1906, page 241, is an article by a successful manufacturing pharmacist on toilet preparations, in which a number of formulas are given. The writer states that he supplies two cold creams, one for general toilet use and one which is sold for theatrical purposes only. The latter is sent out soft and greasy, and so made that a small quantity covers a large space. The formula for the first kind is as follows:

Cold Cream.

Liquid petrolatum.....	1 gallon.
Soft petrolatum.....	7 ounces.
Hard paraffin.....	7 ounces.
White wax.....	2 pounds.
Borax	2 ounces.
Glycerin	2 ounces.
Water	5 pints.
Perfume	enough.

The white wax is first melted in a water-bath (no higher heat must be allowed), then the hard paraffin is introduced, after which the soft and liquid petrolatums are added. The borax is dissolved in water and the solution brought to 140° F. (about the degree of heat the melted solids and liquid petrolatum will be found to possess). The two liquids are next mixed, their container placed in ice water, and stirred briskly until cold, the glycerin and perfume being added.

The addition of hard paraffin to the cream gives it a gloss and a "silky" finish which is quite a feature when appearance is considered.

The formula for theatrical cold cream which the manufacturing pharmacist has found popular is as follows:

Theatrical Cold Cream.

Spermaceti	1 pound.
White wax.....	3 pounds.
Liquid petrolatum.....	2 gallons.
Borax	4 ounces.
Water	1 gallon.
Perfume	enough.

This is a soft cream designed especially to spread easily and quickly, and seems to meet the demand of "the profession."

In putting a preparation on the market, of course much depends upon the appearance of the finished package, while proper advertising is an essential to its success.

Westphal's Auxiliator.—A. L., New York.—In the *Sanitary Bulletin*, for April, 1907, issued by the New Hampshire Board of Health, there is a good deal about nostrums for the hair and scalp. We quote the note on Westphal's auxiliator:

Shows 3.56 per cent. of residue on evaporation, largely glycerin, with borax, or boric acid. No alkaloids or vesicants were detected. The analysis shows 54.8 per cent. of alcohol, of which 20 per cent. (i. e., 10.96 per cent.) was found to be methyl, or wood alcohol.

The latter as is now well known is an active poison, and blindness has resulted from exposure to its vapor.

The preparation now on the market may or may not be the same as the one sold under the same name in 1907. Indeed it is no uncommon thing for nostrum manufacturers to change the composition of their goods. An ability to do this at their convenience

without having to explain to anybody is one of the beauties of secrecy in the manufacture of medicines—from the manufacturers' standpoint; the public be hanged!

Depilatories.—M. B., New York, wants to know how to prepare a powder that may be moistened and applied to the beard and in a few minutes scraped off with a dull instrument and leave the face as if it had been shaved. The powder must have no disagreeable odor and its use must not leave the face sore.

We fear we are not able to supply the information. A depilatory powder whose formula is well-known and has often been printed in the CIRCULAR, is composed of—

Barium sulphide.....	3 parts.
Powdered starch.....	3 parts.
Zinc oxide.....	4 parts.

This is to be applied as set forth above, but we do not recommend it as being in other respects what our querist specifies; indeed, on the contrary, we have heard of untoward results caused by its use.

A somewhat more extended note on the subject of depilatories appears in the CIRCULAR for September, 1910, page 370; and by use of the annual indexes for the past few years many others may be located.

Reciprocity between Boards of Pharmacy.—F. S., District of Columbia, asks: "Will you kindly inform me what States or cities have reciprocity with the District of Columbia on registration certificates and what are the conditions governing the same?" He puts his question in three lines and it probably did not take him over three minutes to write, sign, address, seal and stamp his letter. To collect the data necessary to answer it would take more than three weeks and perhaps as much as three pages of the CIRCULAR would be required to present it to our readers. We would not begrudge the labor of collecting and classifying the facts, or the space they would occupy if printed, if the good to be accomplished by their publication were proportionate to the outlay. But we think it would not be. We undertook something of this kind a few years ago, and after we had written to the secretaries of all the boards of pharmacy in the country (to some of them more than once), and had received answers from them, with many of which were enclosed copies of the rules and regulations of the board or a copy of the pharmacy law of the State, which we were supposed to "read, mark, learn, and inwardly digest," we concluded that the best thing for us to do with the material collected was to make a brief summary of it for publication. This we did, as will be seen by reference to the CIRCULAR for July, 1908, page 319. This summary includes references to college diplomas as well as to board licenses.

The size of the task referred to is due largely to the fact that those boards which accept certificates of other boards in lieu of examination do so under such varying conditions. In most, if not all, cases the prime condition is that the board whose certificate is accepted shall reciprocate the courtesy. It may be that some board will "recognize" a certificate in lieu of an examination when that certificate was obtained by the candidate by passing an examination, but will not do so when it was obtained on account of the fact

that its holder was in business at the time the law for his State was enacted, or because he is a college graduate; or it may be that the certificate will not be recognized unless its holder averaged 5 per cent. more in his examination than the minimum required by the board which issued it, or is so old, or has had so many years of experience. These regulations vary from time to time in the same board, and the pharmacy laws themselves are frequently amended, so that data collected one year may be out of date the next. Therefore the only safe and satisfactory way for a licentiate (or graduate) in pharmacy to do when he wants to engage in his vocation under the jurisdiction of a board other than the one whose license he holds, is to write to the secretary of the other board, telling him all the particulars of the case, and ask him how best to proceed further. He will have to write to the secretary eventually anyhow, or call on him, and so he will be saving time to do this in the first place. We publish every month a list containing the names and addresses of the secretaries of the various boards of pharmacy in the country.

According to the summary hereinbefore alluded to, the boards which practice reciprocity in some form or other, are those of Alabama, Arizona, Arkansas, Connecticut, District of Columbia, Florida, Georgia, Idaho, Indiana, Kentucky, Louisiana, Maryland, Massachusetts, Michigan, Nevada, North Dakota, Ohio, Oklahoma, Oregon, South Dakota, Texas, Vermont, Virginia and West Virginia. The National Association of Boards of Pharmacy, under the egis of the American Pharmaceutical Association, is working, with moderate although encouraging success, to reduce reciprocity between boards of pharmacy to a system. Then there are associations of boards of pharmacy of a more or less local nature organized largely for the purpose of fostering reciprocity between their members. There is such an association composed of the boards of the New England States, and only last month (page 666) we chronicled an annual meeting of the Interstate Association of Boards of Pharmacy, composed of the boards of the States of Kentucky, Indiana, Ohio, Michigan, Wisconsin, Minnesota and Illinois; and also mentioned (page 667) that the Southern Association of Boards of Pharmacy had recently held a meeting at Atlanta. At both meetings the subject of interchange of board certificates was one of the principal subjects discussed.

Under the laws of this State no pharmacist is licensed unless he had a certain specified preliminary education before attending a college of pharmacy, and is a graduate of a college of a certain specified standing. Naturally the New York board does not reciprocate with boards maintaining a lower standard, which means any other board in the country, with possibly one or two exceptions.

Hall's Hair Renewer.—T. R. P., Indiana, wants us to give him some idea of the old formula of Hall's hair restorer. We do not know this preparation at all, but in the CIRCULAR for September, 1887, page 205, is a note to the effect that Hall's hair renewer is believed to consist essentially of sulphur and lead acetate, in water and glycerin. A warning as to the poisonous nature of the lead is therein given.

In the *Sanitary Bulletin* of the New Hampshire Board of Health for April, 1907, (see the CIRCULAR for September, 1907, page 589), is an article on prepa-

arations for the hair in which it is stated that an examination of Hall's hair renewer showed glycerin and sulphur, while tests for alcohol, heavy metals, skin irritants, borax, etc., resulted negatively. Says the *Bulletin*: "This sample does not appear to represent the old formula; neither is it the new, now advertised as put up in a different styled package, and said to include glycerin, boroglycerin, capsicum, bay rum, sulphur, tea, rosemary, alcohol and perfume."

Tasteless Castor Oil.—J. B. D., Missouri.—Look in the annual index to the CIRCULAR bound with last month's number, and you will find references to three notes and formulas on this subject, one being in the December issue, page 620; one in the October issue, page 507; and one in the March issue, page 113. Then take down your annual index for 1909, in which you will find five references to this subject, the notes and formulas themselves being in the issues for December, page 632; October, page 514; April, page 185; February, page 82; and January, page 23. In the annual index for 1908 there are three references, one of them being to a note in which several formulas are given. In 1907 it seems that we gave the subject a temporary rest after the five references to it the year previous, when we printed eight or ten formulas for the preparation and two somewhat extended articles on the subject.

It would seem from this—to go back no further—that it is through no fault of ours that all our readers have not learned how to prepare so-called tasteless castor oil.

You do not state whether you want a preparation for dispensing by the dose or one for general family trade, so we give you a formula—one of the many referred to above—for a prepared castor oil that may be sold either way:

Castor oil.....	12 ounces.
Fluidextract of licorice.....	½ ounce.
Fluidextract of sarsaparilla.....	3 drams.
Oil of peppermint.....	2 drops.
Oil of anise.....	8 drops.
Oil of lemon.....	8 drops.
Glycerin.....	enough to make 16 ounces.

Those who keep their copies of the CIRCULAR and bind them do not have to write for such formulas as this and then wait until the next month for an answer.

Black Waterproof Drawing Ink.—S. B., Texas.—In a note on "Show-Card Ink" in the CIRCULAR for June, 1910, page 280, appear several formulas for marking inks, one of which is given herewith in the hope that it may suit you:

Brown shellac.....	4 drams.
Alcohol.....	4 ounces.
Borax.....	7 drams.
Distilled water.....	6 ounces.
Water-soluble nigrosin.....	12 grains.

Dissolve the shellac in the alcohol, and the borax in the water with the aid of heat. Pour the alcoholic solution slowly into the aqueous solution, stirring constantly. When cool dissolve in the liquid the nigrosin.

Another formula directs that equal parts of shellac, borax and acacia be boiled together in enough water to make a solution of the proper consistency, which is to be colored by the addition of water-soluble anilin dye of the desired color.

Coloring Bay Rum.—In the Circular for October, 1910, page 516, F. O. Collins, New York, said that filtering bay rum through magnesium carbonate gave it a satisfactory color. In the December issue, page 635, John J. Davies, Pennsylvania, took issue with Mr. Collins, averring that bay rum so filtered would throw down a flocculent precipitate, and if again filtered would repeat this behavior, and so on ad infinitum. Said he: "Of all things, magnesium carbonate is the least desirable for this purpose. I find talcum the most satisfactory filtering medium there is."

Now comes George S. R. Wright, Pennsylvania, who adds this note to the discussion:

If Mr. John J. Davies, of Pennsylvania, will add powdered magnesium carbonate to his bay rum, in the proportion of 1 ounce to 1 gallon, and allow it to stand ten days or two weeks before filtering, he will obtain a beautiful clear and slightly green bay rum, which will never need refiltering. I have made it so for over thirty years, and write, therefore, from ample experience.

This ought to settle the matter—and Mr. Davies—and if it is not sufficient for this purpose perhaps the following communication from the man who introduced the subject will answer. Mr. Collins now writes:

I have much pleasure in sending you a sample of bay rum which has been once filtered through magnesium carbonate, and has stood some weeks. You will thus see that I have not experienced the inconveniences referred to by Mr. J. J. Davies in your December number as connected with the use of that salt as a filtering medium.

The sample sent by Mr. Collins is as pretty and clear a specimen of bay rum as anyone could wish to see, and is an acceptable Christmas present.

We trust the discussion of this subject has proven edifying to our readers generally and we thank those who have taken part in it. We hope there will be many more like it over other preparations.

Flavoring Compound Solution of Sodium Phosphate.—R. C. B., Virginia, desires a process for coloring and flavoring compound solution of sodium phosphate, preferring a lemon flavor and tint.

As a starter we suggest that the quantity of citric acid in the official formula be increased to 180 grammes and that the following mixture be added in place of an equal portion of distilled water:

Terpeneless oil of lemon..... 20 minims.
Alcohol..... enough to make 4 drams.

The solution should be shaken with a little paper pulp before it is filtered.

For the color we suggest a few drops of liquid caramel and a drop or two of a weak solution of indigo sulphate.

Some five years ago F. P. Robinson contributed to the *Bulletin of Pharmacy* the following formula for a palatable concentrated solution of sodium phosphate:

Sodium phosphate, anhydrous..... $6\frac{1}{2}$ ounces.
Tincture of fresh lemon peel..... 1 dram.
Phosphoric acid 85-per cent..... 960 grains.
Glycerin 1 ounce.
Distilled water.... enough to make 1 pint.

Dissolve the salt in a mixture of the water and the acid; add the glycerin and the tincture, and filter.

Under the federal food and drugs act and the statutes of many of the States, neither of these preparations could be sold as compound solution of sodium phosphate.

Oil of Turpentine with Compound Tincture of Lavender.—J. E. P., Arkansas, writes: "The following formula has caused me much trouble. First, it turns very dark-colored after a short time; second, if the potassium iodide is left out it does not turn so dark, but even then it is darker sometimes than I want it. My trouble is one of a color change. I have tried emulsine instead of acacia."

Here is the formula:

Potassium iodide..... 32 grains.
Rectified oil of turpentine..... 2 drams.
Compound tincture of lavender.... 2 drams.
Powdered acacia..... enough.
Syrup..... enough to make 4 ounces.

Make an emulsion.

Presumably the darkening of this mixture is for the most part due to the action of the oil of turpentine on the coloring matter in the tincture. Hence it might be largely obviated by omitting the compound tincture of lavender and replacing it as a flavor with a small quantity of a mixture of the oils of lavender, allspice and rosemary.

We take it that the tincture is employed also as a coloring agent. In this rôle it may be replaced by a small quantity of solution of carmine. As we are at a loss as to what shade would be satisfactory we cannot give proportions. A sample of the mixture prepared by us and colored with carmine retains its original color quite well for the short time we have had it under observation.

German Salve or Dutch Butter.—W. M. O., New York, asks: "Where did the name German salve or Dutch butter applied to green soap originate?" We referred this question to a known expert on the ancient names and ancient history of drugs, Otto Raubenheimer, whose reply follows:

Having made a specialty of the history of drugs, etc., and the etymology of pharmaceutical names, a most interesting study, I take pleasure in giving my explanation of the origin of the names German salve, Dutch or German butter and green soap.

The first authentic record of soap, and especially of soft soap, is found in the eighteenth volume of the great work *Historia Naturalis* by the celebrated Roman naturalist and historian Plinius (Pliny). When the Romans invaded Germany they found that the Germans prepared from the fat or tallow of goats and the white-burnt or calcined ashes of beechwood, by boiling and stirring, a preparation or ointment of butter-like consistency (therefore the name "Dutch butter" or better "German butter," called *sapo*). The old Germans originally used this as a toilet article, as a pomade or salve for the hair (therefore the name "German salve"), until it was discovered that by wetting the hair with water the soap also possessed cleansing properties.

Credit is also due to the old Germans for discovering that hard soap results when soft soap is treated with salt. The so-called salting-out process is used to this day in the manufacture of hard soap.

Green soap originated in France when hempseed oil, which has a bright green color, was saponified with potash.

Tablets for Indigestion and Dyspepsia.—F. W., Missouri.—These usually contain pepsin either alone or in combination with one or more such substances as nux vomica, charcoal, peppermint, sodium bicarbonate, bismuth subnitrate and extract of cascara sagrada. Just which is the best combination for any particular case the pharmacist should allow the physician to decide.

Extract of Coffee.—A. C., New York, wants to know "if there is a way of getting a formula for liquid coffee extract and turn it into powder form like such as malted milk."

In our boyhood days there was among the staples in the "company store" a coffee essence, a dark-brown, glossy mass packed in small pulp-board cylinders. This was chipped out somewhat as the apothecary dislodges fragments of a hardened solid extract, and used to fortify the infusion of torrefied rye, cow-peas, and sassafras buds that served as coffee in the homes of the less affluent, where real coffee was a rarity. Practically all that this essence had in common with coffee was a bitter, tannin taste. Presumably it was a chicory extract produced by evaporating a boiled infusion of that substance.

A liquid extract which under a fanciful name in some sections succeeded the old essence is said to have been made as follows:

Ground coffee.....	18 ounces.
Ground chicory.....	18 ounces.
Alcohol	6 ounces.
Glycerin	12 ounces.
Syrup	4 pints.
Water	enough.

Gently boil the coffee and the chicory in a covered vessel with 5 pints of water for about 5 minutes. When the infusion has cooled, strain through flannel pressing the marc and adding enough water to make 5 pints. Add the alcohol and the glycerin and then the syrup.

Such an extract might be incorporated with enough sugar of milk to make a powder, but it would scarcely taste like coffee.

We suggest that you proceed as follows:

Take 1 pound of ground coffee and place it in a Soxhlet extraction apparatus with 2 pints of water. Extract at about 105° C. for an hour. Collect the liquid and when it has cooled, mix with it sufficient of a mixture of equal parts of starch and sugar of milk to form a stiff paste. Rub this through a granulating sieve; allow the granules to dry spontaneously, and reduce the product to a powder of the desired fineness. The so-called "milk flour" might be found useful as a drier.

A water-soluble physiological extract of coffee used by Perrot in pharmacodynamic study is made as follows (*Bull. gén. de Therap.*):

Green coffee is deprived of its diastases by the action of alcohol vapor under pressure, then dried and pulverized. This powder is exhausted with 70-per cent. alcohol. The extract obtained by distillation in a vacuum in the cold is washed with ether, the resulting product being a yellowish hygroscopic powder, which contains all the caffeine of the coffee.

Scent for Traps.—H. L. H., New York.—The "Old Trapper" of our youthful days once in a burst of inebriated confidence informed us that his "beaver bottle" contained a mixture of dried "bark stones" (the castor of the *materia medica*), nutmeg and whisky. Doubtless any aromatized tincture of castor would serve as well.

These scents are in truth used more to conceal the "man smell" on traps than to attract victims—no trapper, however, will admit this to another person. "Nevair; bosh!" says Injun Joe, pointing knowingly

to his own superior cranium. "Deed I no gait twainy fox on er roun, whar drag ze skeen?" And you can't convince him that the roaming foxes had been lulled into a false security because the scent of their dead brother's pelt was stronger yet than Joe's peculiar odor.

Here is a mixture that has been lauded as a disguise of the disquieting scent of blood or human hands:

Copaiba	2 ounces
Oil of geranium.....	30 minims.
Olive oil.....	3 ounces.

A great favorite in some localities is oil of rhodium. *Asafetida* is by many upheld as the fish and game attracter par excellence.

Regents' Counts and a 1904 Matriculate.—F. T. D., New York, writes: "Would a student who matriculated in a college of pharmacy in New York State in 1904 before regents' counts were required have to have the necessary counts now in order to complete his course and try the New York State board? The student completed his junior year in college in 1904."

This query was referred to the State board, and Secretary Bradt's reply follows:

The former board accepted for examinations candidates matriculating in 1904 prior to the enactment of the prerequisite law, and whose senior year was completed subsequent to 1905, at which time the prerequisite law became operative, providing the candidate was a graduate of a New York State college, and presented his diploma as evidence of such, but only providing his name was on the list of matriculates furnished the education department as required at that time.

Rule 27 of the present board reads as follows: "The rules adopted by the regents and the board for the inspection and registration of schools of pharmacy under the amended law of 1905 remain in force unless specifically repealed by article XI of the public health law or by these rules."

As the rule of the former board has not been repealed by article XI of the public health law or by any other rule of this board, the above rule is still in force.

Therefore, if the particular student above mentioned was not on the list with others transmitted to the department at that time, kindly advise us of his name and the name of the college, when the matter will be taken up with the department direct.

Making Tablet Triturates.—"Ego," New York, writes:

I would like to hear from your subscribers something relating to *tablet triturate* making. I am certainly long enough in the business to know how, but I don't hesitate to say that a good tablet is a stunner for me. I have tried all I could think of but either my product is too soft or it is hard and shrinks; at any rate, it never keeps like the tablets made by the manufacturer. Somehow I don't seem to get at the right proportions. Maybe some brother pharmacist can help me out on that score. Reciprocation and appreciation assured.

The columns of the CIRCULAR are open to any brother who thinks he can be of assistance to the writer of the above appeal. As he does not ask us for our help we shall wait to see what others do before volunteering it.

Oiling Silk and Muslin.—J. G., Pennsylvania.—If you will send us your name we shall see what we can do for you. Your attention is called to the standing notice at the head of this department to the effect that we do not answer anonymous queries.

Legal Aspect of the Sale of Ergot.—"Salol," New York.—So far as we are aware, the only law in this State in which ergot is mentioned by name, is the pharmacy act, which places it in "schedule B," along with oil of tansy, oil of savin, and cotton root, and a number of such poisons as aconite, belladonna, etc., and the preparations of any of them, and these the druggist is required to label "poison," and before delivering them to the purchaser, he is to satisfy himself that the purchaser is aware of their poisonous character and wants them for a legitimate purpose.

However, the Penal Code, section 318, provides that—

A person who sells, lends, gives away, or in any manner exhibits or offers to sell, lend or give away, or has in his possession with intent to sell, lend or give away, or advertises, or offers for sale, loan or distribution, any instrument or article, or any recipe, drug or medicine for the prevention of conception, or for causing unlawful abortion, or purporting to be for the prevention of conception, or for causing unlawful abortion, or advertises, or holds out representations that it can be so used or applied, or any such description as will be calculated to lead another to so use or apply any such article, recipe, drug, medicine or instrument, or who writes or prints or causes to be written or printed, a card, circular, pamphlet, advertisement or notice of any kind, or gives information orally, stating when, where, how, of whom, or by what means such an instrument, article, recipe, drug or medicine can be purchased or obtained, or who manufactures any such instrument, article, recipe, drug or medicine, is guilty of a misdemeanor, and shall be liable to the same penalties as provided in section 317 of this Code.

In the consolidated laws of 1909 are also certain sections which refer to abortion and fix severe punishment for supplying the means to bring it about.

Foaming Hair Tonic.—G. R. H., New York.—It is easy to make the foam; the hard part is to find the hair tonic. We do not know of one which we can confidently and conscientiously recommend as harmless and effective, although water which has stood in contact with washed sulphur we believe to be the former, and we have heard on what we regard as credible authority, that it is the latter—at least in some cases. Whether such a water would be rendered less effective by the addition of some saponaceous material to make a foam we are unable to say.

Tincture of green soap, diluted with (say an equal volume of) water makes a good foaming hair wash, and the same may be said of some of the many shampoos for which we have recently given formulas. (See the CIRCULAR for last month, pages 631, 635 and 643.)

Emmenagogue Pill.—F. W. W., Missouri.—See the answer to M. D. C., Hawaii, under the heading "The Best Nostrums for Certain Troubles," on page 27.

Bust Developers.—J. C. B., New York.—We do not think well of this class of preparations, for not only do we regard them as "fakes" of the first water, but believe such effects as they do have, if any, are apt to be deleterious. Pharmacists had better leave such matters to physicians on the one hand and to fakers on the other; pharmacists are not physicians, and when they attempt to be, without going through the regular routine, they become fakers.

Galega and calcium lactophosphate are the princi-

pal ingredients of an advertised "bust developer" in tablet form, and that such combination will not do what is claimed for the nostrum, any therapist can tell. Massage of the breasts should be discounted on moral grounds.

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Stomach Rite.—"Simplex," New Jersey.

Albucol; where may it be obtained—E. M. C., Missouri.

Orange Manna.—C. W., Colorado.

Alternating Current Rectifier, and plates to be used in connection with the same, to change an alternating current of electricity to a direct current.—M. S., Illinois.

For answers to appeals published in last month's CIRCULAR we are indebted to H. Maier, New York; Carl H. Averitt, Indiana; and Herbert P. Harrison, Rhode Island, to each of whom we tender our thanks. The information they supplied either is printed in this issue or has been communicated to the querists, respectively, direct.

Some New British Pharmaceuticals.

The appended formulas are selected from a large number printed in the *Pharmaceutical Journal* as suggestions for the next issue of the British Pharmaceutical Codex:

BORIC HONEY.

Boroglycerin	10 grammes.
Glycerin	10 grammes.
Clarified honey.....	80 grammes.

COMPOUND MENTHOL SNUFF.

Menthol	7.5 grammes.
Ammonium chloride.....	25.0 grammes.
Boric acid.....	15.0 grammes.
Lycopodium	52.5 grammes.

Reduce each ingredient separately to a fine powder; mix the powders and pass through bolting cloth.

IMPERIAL LEMON DRAUGHT.

Potassium bitartrate.....	5.00 grammes.
Citric acid.....	0.80 gramme.
Sugar	50.00 grammes.
Oil of lemon.....	0.25 c.c. (mil).
Tincture of lemon.....	5.00 c.c. (mils).
Distilled water....to make	1,000.00 c.c. (mils).

SIMPLE INHALANT.

Oil of eucalyptus.....	10 c.c. (mils).
Oil of pine.....	5 c.c. (mils).
Oil of cassia.....	5 c.c. (mils).
Menthol	5 grammes.
Thymol	1 gramme.
Camphor	2 grammes.
Tincture of benzoin.to make	100.00 c.c. (mils).

Mix and make a solution.

COMPOUND EUCALYPTOL SPRAY.

Eucalyptol	80.0 c.c. (mils).
Camphor	20.0 grammes.
Menthol	20.0 grammes.
Thymol	1.1 grammes.
Liquid petrolatum.to make	1,000.0 c.c. (mils).

Dissolve the other ingredients in the liquid petrolatum.

Nebraska Board Questions.

Herewith are reprinted the questions used by the Nebraska Board of Pharmacy at an examination held November 9th, 1910. Other sets of questions asked by this board appear in the issues of the CIRCULAR for December, 1908, page 621; May, 1907, page 370; November, 1906, page 408; August, 1904, page 185; and September, 1897, page 264.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give to our readers, just as nearly as practicable, the questions as they were presented.

Pharmacy.

Herbert Lock, Examiner.

1. What are the units of weights and measures in the system on which the Pharmacopœia is based?
2. How many grains of cocaine hydrochloride must be used to make 250 c. c. of a 4 per cent. solution of this salt in water?
3. How many fluid ounces of distilled water must be added to 50 ounces of 95 per cent. alcohol to make 11½ pints of 25 per cent. alcohol?
4. What are the best solvents for the following drugs: Tannin, Phenol, Menthol, Boracic Acid, Corrosive Sublimate, Gum Arabic, Gutta-Percha, Pyroxylin, Gum Benzoin, Alkaloidal Salts?
5. What processes are used in the extraction of drugs by solvents? What are the conditions of perfect percolation?
6. Give full directions for making an official tincture by percolation, one by maceration, and one by simple solution.
7. How may heat be regulated and applied in its various uses in Pharmacy? Give several examples. Name three sources of heat.
8. Give definitions for the following: Desiccation, Sterilization, Distillation, Sublimation, Comminution, Expression, Solution, Filtration, Dialysis, Precipitation.
9. Write the following substances in the order in which they rank in weight of equal volumes of each at the same temperature and pressure: Glycerine, alcohol, water, ether, chloroform, sulphuric acid.
10. What is Manufacturing Pharmacy? Dispensing Pharmacy? Commercial Pharmacy? Pharmaceutical Jurisprudence?

[Chemistry?]

D. J. Killen, Examiner.

1. State the name and the general chemical properties of the Halogene group.
2. State the chlorides of mercury: (a) Their names, (b) chemical formulas, (c) composition, (d) solubility, (e) color and other properties.
3. State of silver nitrate its composition, properties and names by which it is known.
4. Give tests, antidotes for HNO₃.
5. (a) What is the difference between an oil and a fat? (b) Is carbolic acid an acid? If not what is it?
6. (a) Is glycerine an oil or fat? If neither what is it? (b) Name the fats in nature.
7. (a) Give the source, formula and characters of carbonate of potassium. (b) What are the symbols of eight elements?
8. Give chemical formula of cream of Tartar, Rochelle salts.
How would you make seidlitz powders?
How is potassium chlorate manufactured?
9. What occurs when a steel spatula is dipped into strong solution of copper sulphate?
What effect does ammonia water have upon an aqueous solution of Ferric Citrate?
10. Complete the following equations

$$\text{Mg O} + \text{H}_2 \text{SO}_4 =$$

$$\text{K}_2 \text{CO}_3 + \text{H}_2 \text{SO}_4 =$$

$$\text{CaCO}_3 + 2 \text{HCl} =$$

$$\text{Na}_2 \text{S}_2 \text{O}_8 + 2 \text{HCl} =$$

$$\text{K}_2 \text{CO}_3 + 2 \text{HCl} + \text{H}_2 \text{O} =$$

Materia Medica.

Frank Koss, Examiner.

1. Identify specimens 1 to 8.
2. Give the Pharmacopœial name, part used, active constituents and average doses of the U. S. P. preparations of the following drugs: Cascara Sagrada, Peppermint, Coca.
3. (a) What are Fungi? (b) Name an important drug from this source, and give its therapeutic uses.
4. (a) Where are protein compounds found? (b) What are their constituents? (c) What are their physical properties?
5. What standard is established by the U. S. P. for Pepsinum, Pancreatinum?
6. (a) Name five official vegetable acids? (b) Give source and state dose of each.
7. Name two each crude official drugs having the following therapeutic properties: Astringent, Anthelmintic, Diuretic, Hydragogue, Mydriatic, Taenicide.
8. State source of following articles and how obtained: Creosote, Elaterium, Fel Bovis.
9. Name five organic Pharmacopœial preparations that are purgatives. Give average dose.
10. Define Materia Medica, rhizome, alkaloid, gum resin.

Toxicology.

A. V. Pease, Examiner.

1. (a) Give accurate definition of the word poison. (b) Name five poisons that are rapidly fatal. (c) Name five poisons that are slow and cumulative in effect.
2. With reference to the study of toxicology define: (a) Antidote, (b) Antagonist. Give an example of each.
3. In case of following ante-mortem symptoms, what poison would you suspect? (a) Moist skin, mental dullness, then coma. (b) Delirium, dilated pupil, skin dry and hot.
4. Name three inorganic poisons, giving fatal dose of each and antidote. Write the antidote after the name of the poison.
5. (a) Name four kinds of poison for which oils and fats that are useful chemical antidotes. (b) Name four cases in which they are contraindicated.
6. (a) Give adult toxic dose of Morphine Sulphate. (b) Give inorganic chemical antidote for same. (c) Give vegetable physiological antidote for same.
7. What is a fatal dose of liquor potassii arsenitis? Give antidotal treatment.
8. Name five articles common in the household that may, in emergency, be used as antidotes for poison. Give poisons for which they may be used, and method of treatment.
9. Give safe adult dose of acetanilid. Give probable smallest fatal dose. Give antagonistic treatment.
10. (a) Give physiological reason for use of mucilaginous drinks in case of poisoning. (b) Name five poisons for which tannin is a chemical antidote.

Extract of Cinchona for Wine.

Dufau (*Bull. des Sci. Pharmacol* through *Pharm. Journ.*) offers the following formula for a liquid extract of red cinchona suitable for admixture with wine:

Red cinchona, in number 30
 powder 1,000 grammes.
 Diluted hydrochloric acid..... 80 grammes.
 Alcohol, 60 per cent. 6,000 grammes.

Moisten the powdered drug uniformly with 500 grammes of the alcohol mixed with the acid. Macerate for two hours in a closed vessel, and transfer to a percolator. Add more alcohol and macerate for twenty-four hours, then percolate, using the remainder of the alcohol. Collect and set aside the first 1,000 grammes. Continue the percolation, and, recovering the alcohol from the percolate, concentrate to 2,000 grammes; add this to the 1,000 grammes collected; allow to deposit for some days in a cool place, and filter. Each 75 grammes of this product corresponds to 25 grammes of the bark.

Some Questions in Drug Store Mathematics.

Here are a few questions which may interest the drug clerk who wants to keep his knowledge of arithmetic bright until such time as he is ready to "go before the board." This is the "easiest" lot we have printed, and even an apprentice should have no difficulty in answering them. We invite them to try:

1. A druggist bought from a traveling salesman a bill of stationery amounting to \$48.50. A rival salesman offered to duplicate the bill at a saving of \$10. What percentage of saving was represented by the \$10?
2. A druggist bought a gallon of alcohol for \$3.20. He added water to it and sold it as diluted alcohol at \$2.40 a gallon, his profit being 50 per cent. How much water did he add? [In working this example no allowance is to be made for shrinkage.]
3. What is the cost per pound of a mixture of 3 pounds of a powder costing 15 cents a pound, and 5 pounds of one costing 20 cents a pound?
4. In a 6-ounce mixture, to be taken in 1-dram doses, there is 1 ounce (apothecaries') of potassium bromide. How much of the salt is there in each dose?
5. A prescription calls for 12 pills each to contain 1/64 grain of strychnine sulphate. How much of the salt must be used in filling the prescription?
6. The quinine sulphate for how many 1-dram bottles is contained in a 5-ounce can?
7. If lead pencils cost \$3.60 a gross, how much is made on each sale of a pencil at 5 cents?
8. A certain elixir represents 1 per cent. of one of its active ingredients. How much of that ingredient must be used in making a pint of the elixir?
9. A formula calls for 24, 40 and 32 parts, respectively, of the three ingredients which are to enter into a preparation. It is desired to make 1 apothecaries' pound of the mixture. How much of each of the three ingredients must be used?
10. The dose of extract of cascara sagrada being 1½ grains, how many doses are there in 1½ drams?

Answers to November Questions.

1. 15.415.
2. 48.7 per cent.
3. 3.7+ cents.
4. 192+ per cent.
5. \$1.10 (about).
6. 8 pounds, 14 ounces, 375 grains.
7. 4 parts of 10 per cent. and 5 parts of 28 per cent.
8. 6.95 cents.
9. \$4.23 (about).
10. 1 pound, 8 ounces, 223.825 grains.

Essence of Tonka.

A so-called *artificial essence of vanilla* containing no vanilla, may be made as follows, according to the *Chemist and Druggist*:

Tonka beans.....	2½ ounces.
Prunes, bruised.....	4 ounces.
Raisins, bruised.....	2 ounces.
Black currants.....	1 ounce.
Orris root.....	1 ounce.
Peru balsam.....	6 drams.
Treacle, dark.....	10 ounces.

Bruise the tonka beans and infuse for three hours in 10 ounces of hot water. Separately macerate the prunes, raisins, black currants, and orris root (in powder) in a mixture of spirit 25 ounces, water 40 ounces; add to this the infusion of tonka, macerate fourteen days, and add the other ingredients and filter.

After all, the kind of world one carries about in one's self is the important thing; and the world outside takes all its grace, color, and value from that.—Lowell.

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

Once More the Prescribing Druggist.

St. Louis, November 20th, 1910.

To the Editor of THE DRUGGISTS CIRCULAR:

Having read with much interest your various editorials on the subject of counter-prescribing, the sale of opiates by druggists, etc., I believe that there are certain sides of the question which you have failed to touch. A few of them are being treated in the accompanying [reprinted] article, and I have no doubt that many of your readers would like to hear your comments on it through your editorial columns.

You say, let the physician do the prescribing and the pharmacist the compounding and dispensing. At the same time, however, you admit that it may prove a difficult matter to deprive physicians of the right to dispense, for which the majority of them, according to your own statement, are unfit for lack of proper training. On the other hand, many of the druggists whom you expect to go ahead and show a good example by strictly living up to professional ethics, would be doomed to starvation were they depending on the prescription trade of the doctors in their respective districts. They cannot figure with circumstances as they ought to be; they must, in order to make a living and to pay their bills, make the best of the prevailing situation, which with all outward semblance of prosperity is often wretched enough.

Which then is the better course for the druggist to pursue in the case of minor ailments, to administer to the patient who has not the means or can not see into the necessity of consulting a doctor, a harmless remedy of recognized merit, to afford him relief and possibly effect a cure, or to let him try the entire list of "patent" medicines until he has found the right one? The "patent" medicine trade is a perfectly legitimate one, if not from an ethical, none the less from a legal point of view; why then should the pharmacist who stands face to face with the patient be not fit to treat minor ailments, if the manufacturer of curealls is, through newspaper advertisements and by mail, permitted to treat serious ones? Is not the former in the vast majority of cases a better judge of his own competency and has he not a higher sense of responsibility than the latter?

RICHARD STIEBER.

[The enclosure with this letter was a bombastic tirade against physicians and boards of health, which, stripped of its verbosity and "sound and fury" amounts to this: We are interested in the sale of drugs whose use is hurtful to the people; boards of health are restricting such sales, and thereby cutting off a certain source of our income; therefore boards of health are bad things and their ordinances are leading us to ruin. The plea is very simple, but of course it had to be dressed in high-sounding language in order to appeal to honest druggists. That it has suc-

ceeded in pulling the wool over the eyes of some of them who have not taken the time to analyze it seems to be a fact.

Mr. Stieber puts the case much stronger in his letter when he contrasts the neighborhood apothecary honestly trying to relieve some poor customer's ills, and the large manufacturer whose only aim in offering nostrums is to put money in his purse. Doubtless the druggist frequently does the customer a kindness by selling him a simple remedy that will keep him from experimenting with nostrums, but it is so easy for him to overdo this sort of kindness that he should, while still advising the customer to let alone nostrums, urge him to consult a physician about a case in which the application of a simple remedy might, by relieving a symptom, cause him to lose valuable time in the treatment of some serious disease. It is not the province of a pharmacist to diagnose and prescribe, and not even the fact that by so doing he may prevent the customer from injuring himself by experimenting with nostrums is justification for him to engage in this practice, especially when the third and correct course for the customer to pursue is so plain to the pharmacist and could be made so plain to the customer by the pharmacist.—Editor THE DRUGGISTS CIRCULAR.]

Physicians as a Menace to the Public.

New York, December 13th, 1910.

To the Editor of THE DRUGGISTS CIRCULAR:

Referring to the article in your October issue under the heading "Druggists and the Sale of Opiates," I wish to say that the author is lacking a good deal of knowledge in pharmacy and medicine, hence is in the wrong boat. To me he appears no more than a medical booster. Just listen to the piece of hot air: "Does the personal freedom guarantee to each citizen of this country the right to trifle with his life or the life of those dependent on him?"* No! thousand times, no! Not unless you are licensed to do so. Take for instance our well-trained medical man who has the right to kill; but, of course, he must diagnose the case first, and if he has made an error who dares to interfere with him? "According to the best of his ability"; that is all he is required to put in the death certificate. If you have a headache with no typhoid, you may get it if you consult him, because he needs the money. It reminds me of a case: My brother-in-law took sick with severe headache; one of the little angels was called in, and according to his diagnosis the man had typhoid. He put him on a diet of 15 grains of acetphenetidin to be repeated every four hours, and after the patient had taken 2 drams of it you mean to say he was not sick? We had to get another man who drives a big auto and knows how to look wise, and for a \$2 note told us that the patient was suffering from a severe case of intermittent fever. The third doctor, who happened to be a friend of mine, agreed with me that a good dose of castor oil would save the man's life, and it did, because he went to work the next day.

Such great diagnoses occur every day by the hundreds. I know, you know and the medical trust knows that medicine is not a true science; that it is nothing

*Of course no such nonsensical expression as this appears in the article in question, as this correspondent must have known or could easily have ascertained.—Editor THE DRUGGISTS CIRCULAR.

more than guess work, and the less you see the doctor the better you are off, because the drugs he prescribes for you are also guessed at, and if it was not for the layman-druggist, who takes care of the doctors' mistakes in their prescriptions, the undertaker would be kept busy day and night. Every druggist is well acquainted with great knowledge the honorable physicians possess in chemistry, pharmacy, materia medica. We should be thankful for the detail man, he keeps the doctor posted on all the humbugs. And why should the doctor study the above mentioned subjects? He is not required to pass any examinations on these subjects. Just think of it: the druggist who has to spend two years in school, four years in a drug store and pass a rigid State board examination is not allowed to sell 5 cents worth of paregoric, brown mixture, Stokes' expectorant, etc., but the medical man who has a faint knowledge of drugs and chemicals (you can tell that from their prescription writing), he is given the full right to handle all the dangerous drugs! I do not blame the medical trust for protecting themselves from intruders; they know well that their only salvation is morphine and cocaine. Take that away from them and they are lost. The first thing the medical wonder does when he comes out of school is to let his beard grow so he can carry a lot of germs from one patient to the other; then he equips himself with a hypodermic syringe and some tablets, and the first victim he gets with a pain or ache, in goes the hypo, the patient is relieved, and the doctor is a wonder. Who created so many morphine and cocaine fiends if not the doctor? Who has driven hundreds of people to the early grave, if not the doctor? So you see, my friend, opiates are more dangerous in the hands of the physician than in the hands of the pharmacist. All the laws which the medical board is passing are not for the protection of the public health, they are only to protect their own interests. They want the people to run to the doctor with every little pain or ache so he can get a dollar for the prescription, and some of the doctors supply their own drugs so that makes the poor patient lose another dollar, and as far as the habitual "dopes" are concerned, they will cheerfully pay the doctor a dollar for a piece of paper so they can get the dope from the druggist, and a good many doctors are supplying it themselves.

I wonder what will the future pharmacist be allowed to sell? Well I do not think that the board of health will object if he sells postage stamps.

A. L. MERIN.

[Physicians can get along fairly well without the aid of pharmacists, and from all accounts some of them are doing so. If pharmacists think they can get along better without the physicians' trade and co-operation they should do what our friend, the writer of the above letter, is doing—abuse the doctors. If, on the other hand, pharmacists believe it would be to their advantage to keep on good terms with physicians, there is a way for them to do that, too, and a very simple way—prove worthy of the physicians' friendship and confidence. Believing in the second of these alternatives we gave Mr. Merin an opportunity to withdraw his letter, but he insisted upon having it published. We believe it does not express the sentiments of any considerable portion of the pharmacists of this country.—Editor THE DRUGGISTS CIRCULAR.]

Dispensing by Physicians.

Brooklyn, N. Y., December 5th, 1910.

To the Editor of THE DRUGGISTS CIRCULAR:

Allow me to comment on your editorial in the CIRCULAR of November about physicians dispensing. Your comment is not convincing, and I am now opposed to physicians dispensing as much as before reading your editorial. I do not wish to imply that physicians have no right to choose the drugs for their patients: the opposite is the case. They shall choose it, and with the utmost care, only instead of giving the drug to the patient themselves they shall give him a prescription, and he (the patient) shall have it made in the nearest pharmacy.

Medicine in Germany, France or Russia is on a much higher standard than it is in this country, and there physicians do not dispense. You may claim that in those countries druggists do not prescribe. To which I answer, two wrongs do not make one right. In striving to raise pharmacy to a higher standard you also must raise medicine. Both professions go hand in hand, and you will not do away with the other.

As I said in my former letter, we must see to have a law passed preventing physicians dispensing. We have a law preventing druggists prescribing. Why should there be legislation only for us pharmacists? What many physicians told me that study in the medical schools on the subject of pharmacy takes only a few months. I would like to know how can they become competent in so little a time when schools of pharmacy turn out a lot of incompetents after two years' study.

H. RUBIN.

[In a recent issue of the *New York Times* appeared the following editorial note: "Three thousand barbers have combined to demand the suppression of the safety razor by legislation. Do not laugh at them. They are following a long-established American precedent. They, too, have acquired the appetite for legislation. The safety razor hurts their trade, and the government must intervene. . . ."—Editor [THE DRUGGISTS CIRCULAR.]

Happiness in the Drug Clerk's Life.

Portsmouth, Va., November 22d, 1910.

To the Editor of THE DRUGGISTS CIRCULAR:

To my fellow drug clerks I would say: Cheer up, our lot is not as deplorable as has been pictured by some of our more pessimistic brothers. There is plenty of fun to be had as we go along if we only look for it. Take a day off occasionally and go to the country. No reasonable employer will refuse to give you the time. During the past week I asked permission of my employer to go to the country for a day, which was willingly granted. So calling up a friend, we got together, hired a horse and buggy, drove ten miles in the crisp morning air, left our horse at one of the negro cabins, which are plentiful in Virginia, and had a most delightful day's sport on the banks of the Dismal Swamp Canal. We came back elated over our day's luck. I had a refreshing night's rest, and the following morning went about my duties feeling a hundred per cent. better after having spent a day in the wild woods and glorious sunshine near to nature's heart.

Try it, boys, it will do you worlds of good. If you do your duty by your employer, he'll not refuse your request. The result will be that you will go about your duties with a lighter step and a brighter smile. After having spent a day in the country the many petty things that before seemed annoyances to you will have changed their aspect, and you'll see in a different light. These so-called annoyances that come before all of us in our daily walk of life are magnified in our sight on account of continual contact with them. Get "off" for a day, break the monotony, and they will not seem so large. No man will or can be satisfied with an unceasing sameness, it matters not what his or her calling may be. Close your ears to the wails of the "chronic knockers"; you'll find plenty of them in every walk of life.

In conclusion I wish to say for the benefit of the dissatisfied drug clerk, that there are many other callings besides the drug business, and you'll never make a success in any business if you are dissatisfied, so get out. Nothing compels you to stay in the drug business. Find a calling that is best adapted to your talents and tastes, and stick to it. In my opinion the good features of this, our chosen profession, will far outweigh the bad ones; there are lots of bright spots along our pathway, but lots of us overlook them on account of being so engrossed in looking for the dark ones. Smile more and your sales will increase. All "grouchy" men should be colonized and put on an island to themselves. I'll never forget the good logic that my friend and teacher, Dr. Diekman, used to drill into us in his lectures. He said that the man worth while was the one who could smile when everything goes dead wrong.

For fear of the editor's "blue pencil" I'll say adios, with hopes that some of you will profit by the advice of your humble brother.

P. C. WRAY.

Mixtures of Camphor and Phenol.

It is well known that when a small amount of camphor is added to phenol, the mixture assumes the liquid state, and remains in that condition even when cooled to temperatures considerably below the freezing point of phenol. By taking the freezing-point curve for mixtures of the two bodies Wood and Scott (*Journ. Chem. Soc.*) have been able to confirm the statement of Léger as to the existence of a monocamphoride of phenol. The two substances are united in equimolecular proportions, and the freezing-point of the compound is about 18.6°. When the two components are not present in equimolecular proportions, the freezing point of the mixture is lower than that of the pure compound, and falls according as to whether it is phenol or camphor which is in excess. No indication was obtained by the authors as to the existence of a compound formed by the union of two molecules of phenol with one of camphor, as was stated to be the case by Léger.

A New Indicator.

Sacher (*Chem. Zeit.*) recommends as an indicator a tincture obtained by macerating in the cold the pericarp of red radishes with 96 per cent. alcohol for a few hours. This tincture, which is colored red by acids and green by alkalies, is said to be more sensitive than methyl-orange or phenolphthalein.

Notices of Books Received.

DIE ÄTHERISCHEN ÖLE, von E. Gildemeister und Fr. Hoffmann. Zweite Auflage, von E. Gildemeister. Erster Band mit zwei Karten und zahlreichen Abbildungen. Octavo; three-quarter leather; viii + 697 pages. Miltitz bei Leipzig: Schimmel & Co. 1910.

In few if any other of the national divisions of chemical industry has the past decade seen as great advances as have been made in the study of the essential oils. The scientific consideration of these long known substances is wholly a matter of but a few score years, and only in the years after the issue of the first edition of Gildemeister and Hoffmann may it be said to have reached a condition approaching maturity. Rapid as was the progress in the chemistry of the volatile oils and the natural aromatic principles in the latter years of the nineteenth century it has been exceeded by the strides in the province of real knowledge that have marked the first ten years of the present century. Hence it is that this timely edition of a work that was a pioneer in an interesting field and has become a recognized authority, will doubtlessly be well received by those pharmacists who are familiar with the German language, and many others would be pleased were it available in English.

This second edition differs somewhat from the first. It is divided into four parts. The first is similar to the corresponding one in the preceding edition, being devoted to a historical recountal of the trade in spices, aromatics, and volatile oils in all ages and countries. Part II treats of the production of the odorous principles of plants by means of extraction with volatile substances, enfleurage or extraction with non-volatile vehicles, and by maceration.

Part III occupies almost 300 pages devoted to the chief constituents of the volatile oils, and the natural and artificial aromatic bodies. It is, in other words, the general chemistry proper of the aromatic principles. Part IV contains descriptions of the physical and chemical methods of examining and identifying the ethereal oils. In this part are two very useful tables: One for the computing of the percentages of the aromatic alcohols from the ester number; the other for the estimation of the ester number as well as the percentage of alcohols and esters directly by the use of half-normal potassium hydroxide. The chapter on the distillation of ethereal oils has been omitted, the reader being referred to von Rechenberg's *Theorie der Gewinnung und Trennung der ätherischen Öle durch Destillation*, which is noticed below. The second volume to be issued later will treat descriptively of the individual volatile oils.

The collaborators of Dr. Gildemeister, who aided particularly in the preparations of parts III and IV, were Drs. Wiegand, Reclaire, Köhler, Müller, and Rochussen.

THEORIE DER GEWINNUNG UND TRENNUNG DER ÄTHERISCHEN ÖLE DURCH DESTILLATION (Grundzüge einer allgemeinen Destillationslehre). von C. von Rechenberg. Mit zahlreichen Abbildungen und Tabellen. Octavo; three-quarter leather; xii + 259 to 751 pages. Miltitz: Schimmel & Co. 1910.

This is an especially learned treatise on the ramifications of the distillation of volatile oils which lead into the mazes of organic chemistry. A few chapter heads will serve to indicate the nature of the work:

Distillation from Combinations of Different Immiscible Fluids; The Physico-Chemical Factors of Plant-Distillation; The Influence of Molecular Association and Disassociation on Evaporation; Distillation from Mixtures of Different Slightly Miscible Fluids; Distillation in the Presence of Added Compounds. In most of these chapters there are extended tables.

The publishers state that it is not their intention to have this work translated into English "as its scope appeals exclusively to scientific circles, which would not bespeak a more general distribution."

ALCOHOL A DANGEROUS AND UNNECESSARY MEDICINE; How and Why; What Medical Writers Say. By Mrs. Martha M. Allen. Second edition. Duodecimo; cloth; vii + 435 + vii pages. \$1.25. Marcellus, N. Y.: Department of Medical Temperance of the National Woman's Christian Temperance Union. 1910.

There can be but little doubt that the use of alcohol in a medicine rather than as a medicine is extensive and productive of much harm. The nostrum is an especial offender in this connection, and it often contains alcohol not for its therapeutic properties, but for the purpose of popularizing the preparation. However, if what we read be true, the medical profession is not free from over-reliance on alcoholic medication, and oftentimes not governed by the dictum of Dr. Solis-Cohen: "It [alcohol] should be prescribed . . . in the same manner as any other powerful and potentially harmful drug."

It is therefore reasonable to believe that there is a need for Mrs. Allen's compilation of medical evidence against the therapeutic use of alcohol. It may well be read by the benighted devotees of the "disguised cocktail"; and its facts may be a welcome revelation to the medical man who regards alcohol as a stimulant because he has never been taught that it is a depressant.

Pharmacists as a class usually become early acquainted with the "medicinal" tipples because of the regularity with which they are used by portions of the laity; but the man behind the drug-store counter will find in this book much to convince him that there is a danger in the popular potion by reason of the false security the alcohol engenders in the sufferer from some insidious disease. Not alcohol alone but also caffeine, opiates, cocaine, coal-tar antipyretics, and all the seductive armamentarium of the nostrum maker are arraigned by Mrs. Allen and their unrestricted use combatted with weighty argument.

AN INTRODUCTION TO THE CHEMISTRY OF THE COLLOIDS; a Compendium of Colloidal Chemistry for Students, Teachers, and Works-Managers. By Victor Pöschl, Ph. D. Translated from the second enlarged, German edition by H. H. Hodgson, M. A., B.Sc., Ph. D. Duodecimo (small); cloth; 114 pages. London, Charles Griffin & Co., Limited. Philadelphia: J. B. Lippincott Company. 1910.

Colloids and colloidal conditions form an interesting and little understood division of chemistry. They are important in many branches of every-day industry so that their study is profitable to many. The author of the book under consideration declares his purpose to be the presentation of the colloid problem so concisely arranged as to be at the command of those who are confronted by its various phases.

There is much in this book of interest to pharma-

cists, and more than a little of daily use in their vocation. Every little while some new colloidal compound of some metal is brought out as a therapeutic agent and it behooves the pharmacist who is called upon to compound medicines containing these substances to know something about the nature of colloids and colloidal solutions. These are the things he may learn from this book.

A STUDY OF MELTING-POINT DETERMINATIONS, with Special Reference to the Melting-Point Requirements of the United States Pharmacopœia. By George A. Menge. Bulletin No. 70, Hygienic Laboratory, Public Health and Marine-Hospital Service of the United States. Octavo; paper; 101 pages. Washington: Government Printing Office, 1910.

The determination of melting-points is one of the most exacting tasks of the chemist and doubtless all those engaged in pharmacal work will appreciate this bulletin. It should prove particularly of service to the revisers of the Pharmacopœia.

PROCEEDINGS OF THE IOWA PHARMACEUTICAL ASSOCIATION at the Thirty-first Annual Meeting Held at Des Moines, July 6th to 8th, 1910.

ABSTRACT OF THE PROCEEDINGS OF THE UNITED STATES PHARMACOPŒIAL CONVENTION, 1910.

THE CHEMISTS' AND DRUGGISTS' DIARY, 1911. London: *The Chemist and Druggist*.

Inexplicit Formulas.

Assumption on the part of those who know, that those to whom they would impart information also know much of which they are really in ignorance, frequently leads to the embarrassment and disappointment of the latter. Frequently formulas as given in some of the papers are marked by their inexplicitness, but not often are directions seen which are as vague as those told of by a writer in the *Saturday Evening Post*, who says:

"Dear mamma," wrote a bride transplanted from a Southern family to the North, "please have Mammy Johanna send me her recipe for hot cakes."

Mammy Johanna had presided in the kitchen for thirty years. With much labor she wrote the recipe.

This was it: "Take as much flour as you need, 'cordin' to how many folks they is to eat; put in some salt—Miss Mary knows how much; put in all the rest of the ingredients and be sure to have your griddle hot."

To Blacken Aluminum.

Aluminum articles may be blackened by immersing them for twenty-four hours in a liquid made as follows:

Zinc chloride..... 16 grammes.
Copper sulphate..... 1 gramme.
Hydrochloric acid..... enough.
Hot water..... 60 c.c. (mils).

Dissolve the zinc chloride in about 40 c.c. (mils) of hot water, and the copper sulphate in the rest of the water. Mix the solutions and add hydrochloric acid drop by drop until the liquid becomes clear.

After the article has been removed from the bath and dried at a gentle heat it should be varnished.

Show Card Ink.

The *New Idea* vouches for the formulas below, saying: If you want some good show card inks, try these. Every druggist appreciates the value of show cards, but from the number of inquiries received it is evident that many are having trouble in producing suitable inks. These formulas have been supplied on a great many requests and are proving so satisfactory that we are offering them to all our readers. If you have anything better to give let us have it.

BLACK.

I.

Asphaltum 3 ounces.
Venice turpentine..... 1 ounce.
Lamp black..... ½ ounce.
Oil of turpentine..... 8 ounces.

II.

Nigrosin 1 part.
Water 14 parts.
Glycerin 4 parts.

RED.

I.

Rosanlin acetate..... 2 parts.
Alcohol 1 part.
Water 10 parts.

II.

Bordeaux red..... 3 parts.
Alcohol 2 parts.
Water 20 parts.
Glycerin 1 part.

VIOLET AND BLUE.

Anilin violet or blue (2 RB)..... 1 ounce.
Hot water..... 7 ounces.
Alcohol 4 ounces.
Glycerin 2 drams.
Ether 5 drops.
Phenol 1 drop.

Dissolve the anilin in the hot water, allow this to cool, then add the other things.

Other formulas for this class of preparations appear in the CIRCULAR for June, page 280.

Liquor Aluminii Acetici.

Feist and Hochstaetter (*Arch. Pharm.*) recommend the following process for making liquor aluminii acetici: 26 grammes of barium carbonate are intimately mixed with 20 grammes of water and the mixture added gradually with constant stirring to a solution of 30 grammes of aluminum sulphate in 80 grammes of water. After the addition of 36 grammes of diluted acetic acid the mixture is allowed to stand for eight days in a cool place with occasional stirring. The clear liquid is then decanted and diluted with water until the proper specific gravity is obtained. The liquor, thus prepared, is very stable, contains only a small amount of aluminum sulphate, and otherwise is free from impurities.

Fattening on an Anti-Fat.

Fucus vesiculosus, or bladder wrack, an extract of which is such a popular ingredient in proprietary anti-fat medicines, says the *Prescriber*, is largely used in Ireland to fatten pigs.

DRUG STORE ADVERTISING

By M. P. GOULD, of New York

In this department some of the fundamentals of successful drug store advertising will be expounded each month. The aim is to correct errors of advertising and establish the most profitable and advisable methods of building up retail drug trade by means of the powerful influence of advertising.

Inaccuracy in Advertising.

One of the most amazing things in modern business life is the vast amount of superficiality and inaccuracy. In some lines there is a great tendency toward accuracy. For example, in big business firms there is accuracy in stock invoicing, there is accuracy in handling money, there is accuracy in purchasing, in selling records, in making estimates, in the stopping of leaks and losses through carelessness.

On the other hand, there is also a very strong tendency in the opposite direction. For example, in the statements made by newspapers when they write-up the so-called news of the day. In many ways they are extremely irresponsible. There is inaccuracy in political statements, and political speakers will make statements which they must know are inaccurate—if they know anything. Some salesmen of the old school make statements which cannot be justified on any ground. Another form of inaccuracy which is very costly is the lack of accurate information on any topic. There is an old adage which says, "Ignorance of the law excuses no man."

Now, apply this adage to advertising. Some firms that advertise in magazines do not make any effort to know whether the statements made by the magazines relative to the extent of their circulation is accurate or not. There is a popular magazine which at one time had a circulation of 900,000 that lasted only a short time. Consequently when the circulation dropped back to 650,000 or 700,000 per month the publisher fixed the rate at \$500 per page. There is a rule in magazine advertising that the rate should be about \$1 per page per thousand. If the magazine had 600,000, the rate might be \$600. This publisher, however, figured that, inasmuch as his great circulation had come quickly, it might also be lost quickly; so he fixed a rate of \$500 per page. The circulation actually went down to nearly 400,000, but the rate stayed at \$500 per page, because very few advertisers knew that the circulation was so low. However, so many advertising men are learning in these recent times to be accurate and to know the facts, that this publisher had to spend large sums of money in order to get his circulation back to a figure where it would justify the price of \$500 per page.

In towns all over this country there is a vast amount of loose talk about the circulation of papers. In a city of New York State there are two evening papers, each of which was guaranteeing to its advertisers that it had 5,000 more circulation than any other evening paper. Of course, one or the other must be wrong. Finally, one of the papers made a proposition publicly that five judges should be selected from the five biggest advertisers in the papers of

that town; these five judges should make a careful and thorough examination of the circulation of both papers; and whichever paper had the smaller circulation should pay the other paper one dollar per copy for its excess circulation. When the examination was made one paper had to pay the other \$4,300, because the judges proved that it had 4,300 circulation less than the other paper. Therefore, in that town, every advertiser knew what the circulation of each of those papers was. Before that they had been paying too high a price for their advertising in one of those papers.

It is amazing the notions which even well informed people have regarding newspapers. For example, one of the oldest and most prominent papers in this city is supposed by many people to have over 200,000 circulation. Actually it has 57,000 or 60,000. Another paper which for years was supposed to have had 45,000 or 50,000 circulation has been proven to have only 17,000.

One of the most successful general advertisers has worked out a theory of his own. His theory is that he should pay each publication a certain rate per line per thousand. Therefore, he does not pay a fixed rate. If a magazine, for example, has 50,000 more circulation than the 200,000 it thought it had, he pays a rate proportionately higher than the published rate; but, if the circulation falls down to say 175,000, then he pays a proportionately lower rate than that published. He works this policy wherever he can, and feels that he is getting a rate which is always fair and just to both him and the publisher.

A great many druggists advertise in newspapers without really knowing how much circulation their mediums have. This was illustrated some time ago when an old friend from New England came to see me. He said that he was advertising a specialty in the weekly papers in small country towns in his State. There is a very large and successful weekly paper, published in his own city, which is sent quite thoroughly throughout the State. I asked him why he did not use this paper. He replied with this startling statement: "Well, that paper is not read very much throughout the State. It goes mostly to people who have left the State and subscribe for it merely to keep informed on what is going on in their old homestead." I replied that that could not possibly be so, because one of my other friends had told me that it was one of the best advertising mediums in New England. I immediately went to my files and found that this paper had a total circulation of 28,000. Of this total only 1,400 went out of the State. My caller was so surprised by these facts that he could hardly believe them. He said: "Why, I have known the proprie-

The Factor

EXPERIENCE—that is what counts.

That is the chief factor in the perfecting of a prescription. So far as the law is concerned, every druggist is on an equal footing, but it takes years of experience for a druggist to perfect his first knowledge. Your prescriptions filled by us will be filled right, because our experience gives us the right knowledge of prescription filling and aids us in the proper selection of the right kind of drugs.

: : : : : :

(Name and address)

tor and the advertising manager all of my life and they surely would have told me about that if it were true." I then asked him if he ever asked either of these men for a circulation statement. He replied that he had not. "Then," said I, "how did you get into your mind that most of the circulation went outside of the State?" "Why, that is the general opinion," was his reply. Thousands of druggists are paying out their good money for advertising on no more sound reasoning than merely general opinion.

The first thing that a retailer ought to do when an advertising solicitor comes to him and solicits his patronage is to get the following facts in writing, and an affidavit as to their accuracy: First, what the total circulation is, including street sales (if there are any) home carrier circulation, either news-stand or mail, free exchanges and office use. Second, what the net paid circulation amounts to, deducting all returns, all free exchanges, all damaged copies, all copies for office use, all copies furnished to advertisers. Under this head there must be nothing except the net paid circulation. Third, the extent of the net paid circulation for the town itself, cutting out all outside circulation. For example, there is a very successful paper in New England which has a total circulation of 16,000, but only 9,000 of that total is in its home town, the other copies go far and wide throughout that section of New England. There is another paper in New England which has a total circulation of 24,000, but only 16,000 of this is in the town itself, the rest of the copies go all up and down the valley to people who rarely ever come into that town to trade. There is a paper in this city which boasts a total circulation of 815,000 every evening. Only 450,000 of this is in the city—all the rest is outside. Part of the latter is in New Jersey, Connecticut and New York State, contiguous to the city, so that probably 650,000 copies really reach people who do more or less trading in New York, but the other 165,000 go to remote parts where they do the merchants in the city very little, if any, good. Fourth, what the net paid circulation in the advertiser's district is.

With the above facts in hand—and one must be sure that they are guaranteed facts, the druggist can buy his advertising space, knowing what he is getting.

General advertisers buy space in this way. They require a publisher to tell them what the total circulation is in their town; what the total circulation is in the surrounding towns; how much advertising is carried and how much advertising of this particular manufacturer's class is carried; and how many advertisers use that paper alone in the town. When the advertiser has learned these facts he, in many cases, submits them to his local agent or to some good local dealer for verification. He also refers to his books to learn what the American Advertisers' Association has said about this publisher's circulation; also to the American Newspaper Directory, as to what circulation it credits to this publisher. When the general advertiser has arrived at these conclusions, he is in a position to consider advertising in that paper.

Many a druggist, who has made some such analysis as this of the papers in his town, has decided that he could get better returns for less money if he cut out the newspaper advertising and used some other form. For example, some druggists have made a careful list of all the families on all of the streets from which they draw trade. They get up circulars every week or every two weeks, or every month—just as they feel able to do so—and distribute them to all of these families. When the boy is

== THE CHILDREN ==

THE children know us; they know an unusual pleasure and satisfaction in coming to our store. You can send them to us to perform your errands; to get the simplest drug store product or the most vitally important medicine. We shall serve them cheerfully and carefully. We offer you and the child satisfaction and pleasure in every respect.

(Name and address)

delivering the circulars they have him carry with him samples of goods which the manufacturers supply. In this way they establish themselves as headquarters for that manufacturer's goods, they make the boy's visit more welcome to the homes and they also get readers for their own circulars.

Other druggists make up the same kind of a list of names and then send postal cards to all of them—one card every week. Others use multigraph letters.

On the other hand many druggists are surprised at the number of papers which are delivered into their own territory. They have more faith in the newspapers. They do not "wonder" why it pays them more or why it pays them so little. They do not "wonder" why it seems so hard for them to get returns out of the newspaper advertising.

If it were not so pitiful it would really be laughable—the carelessness displayed by retailers in buying advertising from newspapers. They know so little about what they are buying. Suppose, for example, that a druggist should order a shipment of tooth brushes (amounting to \$100). He does not specify how many tooth brushes there shall be, and when the shipment arrives he does not count the number sent. One would say that such a druggist is a fool. Yet that is exactly what many druggists are doing every year. An advertising solicitor comes to them and says: "I will sell you this 3-inch single column advertisement, on page 5, next to reading matter for \$100 for the year." The druggist says, "All right, I'll take it." He does not know how many papers carry that advertisement each day; he does not know how many of these papers go into his territory; he does not know the quantity he has ordered, nor the quantity he gets. It is a preposterous condition of carelessness—"blind" buying.

Advertising never will get its just deserts until merchants stop treating it as a "shell game" or a "lottery" or a "horse race." Advertising must be studied and must be reduced to the greatest possible accuracy in every detail if it is to take its place where it really belongs.

Another form of inaccuracy in advertising, which is a great loss to the druggist, is in connection with the distribution of advertising matter. A dealer gets out a little booklet. He puts a package of them on his counter; a few are taken away. The rest get covered with other advertising matter or packages of goods; and, possibly for three or four weeks, none of those booklets are being sent out. The druggist wonders why this advertising has not paid him; and he arrives at the conclusion that booklet advertising is a failure. It is not a failure; his method of distribution has been a failure; that's all.

Take another case. The druggist gets out a circular; he hires the local, licensed distributor to deliver these circulars to all the houses in that locality. He does not inspect the work of this distribution to see whether it is really done or not; he does not ascertain how many are thrown into back lots, how many are left in each house, or whether the whole territory has been covered thoroughly. He comes to the conclusion that circular advertising does not pay, because this distribution does not bring him returns. The failure is not due to the circular; the failure is due to the distributor.

Here is another case. The advertiser gets out a nice, little folder to mail to all of the people in his community. Let us say there are 2,000 of the circulars. He tells a clerk to do the work. The clerk gets 2,000 one-cent stamps; he starts to work to address the 2,000 circulars. When he has addressed 1,600 of them he gets tired; he burns up the rest of the circulars and keeps the \$4 worth of stamps himself. The druggist wonders why these 2,000 circulars have not brought him more returns. Suppose the 400 destroyed by the dishonest clerk were to go to the rural free delivery routes around the town. The druggist pays close attention to see whether this folder brings him good returns or not. He notices that quite a few of the town people come in for the goods advertised, but that none of his country customers do so. He decides that it does not pay him to send folders to the country trade. He loses trade because he does not have accurate information.

In addition to the inaccuracy regarding circulations of newspapers and inaccuracy regarding the distribution of direct mail matter, there is loss from a third form of inaccuracy. The druggist gets into the habit of making inaccurate statements in his advertising. To-day that form of inaccuracy constitutes one of the very greatest losses in advertising.

A few days ago I had the pleasure of sitting next to a very successful advertising man at a banquet. He and I were talking over how we got started in advertising. He said that his father owned a dry goods store in the Central West; the son (this man) took care of the advertising. He conceived the idea of demonstrating to the people of that town that his father's firm did not exaggerate in its advertising. One day his father bought a special lot of gingham, which were sold about town for 11c. per yard, but which his father's store could sell at a profit at 8c. per yard. The goods cost 6½c. per yard. So he advertised these gingham at 6c. per yard and stated their value as 8c. per yard. As a result the usual round of shoppers looked at gingham in the other stores, then looked at these gingham and found that these were the same quality of gingham which had been offered in the other stores at 11c. on which there was put a fictitious value of 15c. per yard. The shoppers came and looked at these gingham, bought some of them, went to other stores and compared the goods or took the goods home and compared them with other goods there, or compared them with other goods among their friends, with the result that the next day they came back after more and the third day the store was packed with people after those gingham at 6c. per yard. He said that one act did more to convince the people that his father's store did not exaggerate than all the advertising talk that they had put out in the previous year. That sale proved so successful that all of the rest of the people in the store believed that the son had the right idea about not exaggerating. Ever afterwards the people of that store were content to have their advertisements come out with a lower "value" put after quotations on goods than was stated by other stores, because they found that the store itself gained confidence among all the people by that method.

Pick up newspapers anywhere in the country and see what the druggists are saying about their prescription work. It cannot all be "the most accurate." The dozen druggists in the same town cannot all "save you 25 per cent. on all prescriptions."

Really, a merchant who pays so little attention to his advertising that he is willing to continue to make such worn-out statements as those quoted ought to save his money and not waste so much of it in advertising. Either a person should get into the habit of making accurate statements in his advertising, thereby building up a solid and dependable list of customers, or else he should cut out his advertising. The exaggerated, untruthful, inaccurate kind of advertising has been proven beyond denial to be the most wasteful and costly kind of expense. The advertising that establishes confidence, that brings a customer,

that extends the reputation of the store for fair treatment is the profitable kind of advertising. Any merchant who does not realize this fact is away behind the times.

A fourth great loss through inaccuracy is due to that form of it which has to do with blindly advertising anything that may happen to strike the fancy of the advertiser. This form of inaccuracy comes from the fact that the merchant does not try to keep a reliable record of the results from his advertising. Every merchant ought to have an advertising record book. In that book should be posted the advertisements which he puts into the paper, the date of the insertion and the cost. Opposite, at the head of the blank page, should be written the word "Results," below that should be written (1) The total sales on that day; (2) the total sales of the goods advertised that day; (3) the total sales for the week following, or until the sales cease to be affected by that advertisement; and (4) the total sales of the goods advertised, for the length of time that those sales are affected by the advertisement.

When a circular is issued that circular should be given a page in the book and on the opposite page should be written down a record of results. If a general letter is sent out that should be pasted in the book, and every clerk should keep a record of the number of people who speak about that letter during the week following its mailing, and these records should all be recorded in the book.

Lots of druggists do not know that department stores are constantly advertising goods in one paper at a time and keeping a very accurate record of the sales of those goods in order to test the advertising value of that paper. This is really the way most department stores determine the value of a paper. A new department store opens in a city; it makes a contract with all of the newspapers for the first year. During that entire year it keeps testing one paper after another. When the second year comes, it may cut out two or three papers, because, through a series of tests, it has found that those papers do not bring it returns commensurate with the cost of advertising in them.

If the retail druggist will keep such a record book as is described above, he will learn what kind of goods to advertise. When he knows what kind of goods to advertise, in order to get the most returns at the least cost, he will then know what departments in his store to enlarge. When he knows what goods, when advertised, sell the least, he will know what departments in his store do not appeal to the public. Then, it is his business to find out why those departments do not appeal to the public. He must see whether his prices are too high, whether his goods are right, or whether his clerks in those departments are taking care of the customers properly. Such a record book as this is indispensable to accurate knowledge of trade conditions in the store.

Any retailer who has read this far should have clearly in his mind the four forms of inaccuracy in advertising which are the causes of the greatest losses. Let me repeat them: First, inaccuracy about extent of circulation; second, inaccuracy about distribution of matter; third, inaccuracy about the wording of advertisements; fourth, inaccuracy about returns from advertising.

It is not saying too much to claim that, if the 44,000 druggists in the United States would take this chapter absolutely to heart and revolutionize their advertising upon these four principles, they could, in a year's time, double the value of their advertising without adding one cent to its cost.

Accommodation the Life of Trade.

It was an overcast, indeterminate sort of a day but the drug clerk was cheerful as he whistled behind the prescription desk and chatted with a friend in the front shop. Presently a customer came in and made a small purchase. "Fine day," he remarked. "Great!" replied the clerk, enthusiastically. The customer went out and was followed by another. He, too, made a small purchase and commented on the weather. "Mean weather," he remarked. "Beastly!" said the clerk, dolefully. "Getting warmer," remarked a third customer. "Hot!" said the clerk. Ten minutes passed. Another individual drifted in from the outside world and made a purchase. "Chilly, isn't it," he said to the clerk. "Cold as the pole!" agreed the clerk, with a shiver. His friend had listened to these exchanges with interest. "See here," he demanded, "what kind of weather do you think this is anyway?" "Same kind as the customer," replied the drug clerk.—A waif.

Munyon "Remedies" Declared Misbranded.

In the United States district court at Philadelphia, December 14th, counsel for the Munyon Homeopathic Home Remedy Company pleaded guilty to misbranding certain of its goods, and Judge McPherson imposed a maximum fine of \$600, being \$200 on each of the three bills of indictment.

The Munyon company was indicted under the food and drugs act following complaints made last June to Special Agent Jenkins of the board of food and drug inspection. Charges of misbranding were preferred and allegations were made in the indictments that the "remedies" were not effective for the diseases as declared on the labels of the packages. The "cures" that came under the ban were labeled "Munyon's special liquid blood cure," "Munyon's asthma cure," and "Munyon's blood cure."

Prof. E. A. Ruddiman, of Nashville, Tenn., was a witness for the government and testified that he found upon analysis nothing but sugar in the "blood cure." The attorney for the defense interposed an objection to this, stating that he could not see how the ingredients of these medicines could have anything to do with their misbranding. "It is very material for the court to know whether the charges are serious or merely trivial," interposed Judge McPherson, overruling the objection.

Prof. Ruddiman further testified that the "asthma cure" consisted essentially of cane sugar with a trace of alcohol and that the special \$2 liquid "blood cure" contained [corrosive?] "chloride of mercury, potassium [iodide?] and sugar of milk."

Dr. E. M. Gramm, of Philadelphia, corroborated the testimony of Prof. Ruddiman, and declared that the "cures" were worthless.

The attorney for the defense stated that the company was changing its labels to meet the requirements of the law.

Fined for Adulteration.

On December 14th J. L. Hopkins & Co., of this city, were fined \$400 for adulterating and misbranding drugs, by Judge Hough, of the United States circuit court. The charge was that on April 8th, 1908, it had sold to W. R. Scudder, of Newark, N. J., and shipped in interstate commerce, a lot of drugs in which there was a package labeled belladonna root, about one-half of the contents of which was ground olive pits; a package labeled powdered henbane in which hyoscyamus muticus was found; a package labeled gentian root in which an unknown ground fiber was detected; and a package labeled powdered cloves, from one-third to one-half the contents of which consisted of clove stems.

The defendants in the case had previously entered a plea of "not guilty," but their counsel changed this to a plea of "guilty on technicalities" and paid a fine of \$400.

In a lengthy statement published in the *Oil, Paint and Drug Reporter*, Mr. Hopkins tells why he made the plea he did, and positively asserts that all drugs sold by his house are unadulterated and in full accord with the requirements of the Pharmacopœia and the law.

Antikamnia Case Appealed.

An early hearing is expected in the appeal of the government from the decision in the Antikamnia case (see last month's CIRCULAR, page 654). The federal attorneys have laid their objections to Judge Clabaugh's decision before the court of appeals of the District of Columbia; and will, it is believed, carry the matter to congress in case the finding of the lower court is supported.

It has been intimated that the food and drugs officials have been in favor of carrying the case to the United States supreme court if necessary in order that a final interpretation of the contested provisions of the law be arrived at. The developments, however, seem to point toward the petitioning of congress for the amendment of the law so as to provide for the statement of the parent substances, also of derivatives, the presence of which must now be declared upon the labels.

A press dispatch from Chicago, dated December 21st, told of the arrest of A. G. Wheeler, consul for the Republic of Panama and a former professor of chemistry in the University of Chicago, on the charge of misbranding and adulterating a headache-powder nostrum.

"Spearmint" not a Trade-Mark for Chewing Gum.

Some time ago the United States circuit court for the southern district of New York ruled that the word "spearmint" constituted a valid trade-mark for chewing-gum and that unfair trade methods had been employed by the defendants in imitating the wrappers, labels and coverings of the packages used by the complainant in the action of William Wrigley, Jr., & Co., against the Grove Company, Samuel Grove, Jr., Charles E. Blauvelt, and Simon S. Schiener. This ruling has been modified by a recent decree of the United States circuit court of appeals, on an appeal by the defendants against the action of the lower court in restraining the use of the word "spearmint" and the alleged simulated covers and wrappers.

From the decision of the appellate term it appears that the complainant had no exclusive property in the word "spearmint," which was descriptive when applied to chewing-gum, and that no one could deprive other manufacturers of its use or appropriate it as a trade-mark. On the other hand, the court sustained the count on unfair competition in the use by the defendants of other words and symbols in connection with "spearmint" so as to induce the public to believe that the spearmint gum of the defendants was the product manufactured by the complainant.

The question as to damages alleged to have been sustained through unfair competition will be taken up shortly.

Federal Legislation in Prospect.

In his message to congress, which reassembled in December to sit until the terms of all the representatives and many of the senators expire on March 4th, President Taft expressed himself as favorable to the creation of a bureau of health, and the attitude of Secretary of Agriculture Wilson, as expressed in his report, is not unfriendly to a department of health, provided his department, with its various bureaus, having charge of the health of animals—such as the bureau of animal industry—shall not be dismembered or taken from the jurisdiction of the department of agriculture.

Parcels posts is receiving support, too, in administration circles, and a strong effort to get a law to establish this innovation will be made.

Various food and drugs bills in the nature of amendments to the present act, are now or will shortly be before our national lawmakers.

President Taft is understood to be opposed to the opening of a debate on the Sherman anti-trust law during the present short session of congress, so no change in that act is expected for a while.

Foreign Medicaments in Cuba.

In September, last, the Cuban health officials, perplexed by the appearance of home-made imitations of various American nostrums and proprietary medicaments, gave a stricter interpretation of the pharmacal regulations of May, 1909, so as to require the label of each preparation to bear the name of the actual compounder, and further to require that this compounder "possess a diploma from a university" authorizing him to practice pharmacy in his own country. The superseded interpretation had required the name of the proprietor or manufacturing company to be given on the label.

Obviously the later requirement could not practically be complied with in many instances, even though the "university diploma" was not literally expected. Complaint was therefore made through the State department; and after considerable diplomatic correspondence that department has announced a return to the earlier requirement, with the provision that a consular certificate of identity be filed by the foreign manufacturer whenever a doubt exists in the minds of the Cuban authorities.

Near-Vanillas Barred in Oklahoma.

The attorney-general of Oklahoma has advised the food commissioner that the State law is violated in the sale of imitation vanilla flavoring preparations. Extracts labeled "Vanilla and tonka flavoring extract; extract of vanilla, 35 per cent.; extract of tonka, 65 per cent.; caramel color," or "Vanillin flavor; caramel coloring," will not be in conformity with the provisions of the law.

News of the Pharmacists in the Federal Service.

The following official announcements have been made:

NAVY.

Pharmacist H. E. Sausser, appointed November 21st, was ordered to duty at the naval hospital at Annapolis, Ind., November 28th.

PUBLIC HEALTH AND MARINE-HOSPITAL SERVICE.

Pharmacist Henry Gahn received a grant of two days' leave of absence from November 12th and one day's leave of absence from November 19th.

Pharmacist F. S. Goodman received a grant of ten days' leave of absence from December 22d.

Pharmacist L. W. Ryder received a grant of five days' leave of absence from November 21st, and was ordered to report to the director of the hygienic laboratory November 25th.

Pharmacist Frank L. Gibson received a grant of two days' leave of absence from October 28th.

Pharmacist J. L. Osborn received a grant of thirty days' leave of absence from November 28th.

Pharmacist G. A. Morris was relieved from duty at St. Louis Mo.; and directed to proceed to Chicago, Ill.

Pharmacist L. C. Spangler was relieved from duty at the hygienic laboratory November 25th, and ordered to the marine-hospital station at Washington, D. C.

Pharmacist G. I. Van Ness, Jr., was relieved from duty at Chicago, Ill., November 25th, and directed to proceed to St. Louis, Mo.

Pharmacist H. Megaw received a grant of twenty-five days' leave of absence from November 9th.

Pharmacist H. D. Leech, appointed November 17th, was ordered to report to Stapleton, N. Y., for duty, November 21st.

Pharmacist G. W. Iltis received a grant of seven days' leave of absence from November 27th.

Pharmacist C. H. Bierman received a grant of fourteen days' leave of absence from December 16th.

Pharmacist F. L. Brown received a grant of seven days' leave of absence from December 24th.

Federal Positions Open.

The United States civil service commission announces that on January 21st an examination will be held to secure eligibles to fill vacancies as they may occur in the positions of *scientist in soil chemistry* in the bureau of soils, at salaries ranging from \$1600 to \$2000 per annum. The age limit is twenty years or over and applicants will be required to have pertinent education and training, experience, and to have made original investigations. Chemists are wanted who have the degree of a doctor of philosophy, from an American university, or its equivalent in physical, organic, or biological chemistry and related subjects, including mineralogy. Applicants should apply at once to the commission for examination form 304 and the special form for this examination.

On January 18th an examination will be held to secure eligibles to fill a vacancy in the position of *chemist* in charge in the customs service at the port of Philadelphia, Pa. The salary attached is \$2000 per annum. The examinations will consist of tests in general physics and general and analytical chemistry. Training and experience will also be a factor. Men only, who have reached their twenty-first but not their fifty-fifth birthday will be admitted to this examination and it is necessary that the appointee shall have a broad theoretical training and experience in organizing and directing a chemical laboratory. Applicants should apply at once for form 1312. No applications will be accepted unless properly executed and filed with the commission at Washington prior to the close of business on January 7th.

Dr. Wiley Receives a Medal.

Dr. H. W. Wiley, chief of the bureau of chemistry of the United States department of agriculture, was recently in Philadelphia to attend meetings of committees for revising the Pharmacopœia. While there he was a guest of honor at two luncheons and a dinner, and delivered an address before the members of the Franklin Institute, from which he received the Elliott-Cresson gold medal, awarded to him in recognition of his contributions to science.

President Walton Clarke, of the Franklin Institute, eulogized the recipient's work as being of enormous benefit to

the world. In his acceptance of the honor, Dr. Wiley discussed "Applications of Chemistry to Public Welfare," and declared that not only foods and drugs, but many other products should be sold on principles of honesty and be true to the labels they bore. He expected a material strengthening of the present food and drugs acts, federal and State. Early in his career, Dr. Wiley said, he had conceived the idea that a man who eats was entitled to pure food and a man who is sick is entitled to pure drugs. He was glad to be able to say that the ranks of the adulterators were broken and that their political influence had lost much of its force.

The Pharmacist's Duty.

Recently the Maine supreme court denied the petition for a new trial presented by a druggist convicted in the Androscoggin county court and mulct for damages amounting to \$1,400, because of alleged negligence in dispensing tablets of corrosive mercuric chloride instead of chlorodyne tablets. The defense offered was that the error was a natural one in that the two preparations were in adjacent bottles on the same shelf, and that in general appearance the tablets were very similar.

Justice Whitehouse, who drew up the opinion of the higher court, said that it was inconceivable that the dispenser had given any especial attention to the labels on the shelf bottles or to the tablets themselves which were of a different color from those prescribed; and that "although the defendant may have been a skilful and competent druggist, he unfortunately omitted on the occasion in question, to exercise such care and prudence and to take such reasonable precautions as the safety of his customer and the measure of his legal duty required."

Progress in Pharmacopœial Revision.

Work on the ninth revision of the United States Pharmacopœia is said to be rapidly assuming shape.

On December 21st a meeting of the sub-committee on scope was held at which additions, deletions and changes in standards were discussed. The first installments of the work of this committee have been submitted to Chairman Remington, with the unanimous approval of its members.

On December 22d the executive committee of the committee of revision met at the home of Prof. Remington, at Philadelphia, and resolutions were adopted to the effect that the hygienic laboratory at Washington be requested to furnish for the introductory chapter of the Pharmacopœia methods for determining boiling points, melting points and solubilities, to insure uniformity and greater accuracy; and that the methods used for testing standards by the official association of agricultural chemists be used as far as possible in the revision of the Pharmacopœia.

It was announced that no choice had been made in the election to fill the vacancy caused by the recent death of C. S. N. Hallberg, of Chicago, as no candidates nominated had secured the requisite twenty-six votes, a majority necessary for election. J. B. Godding, of Boston, received 16 votes, the highest number cast for any one candidate. Prof. A. H. Clark, of Chicago, was second on the list, the others being E. G. Engstrom, of Pittsfield, Mass.; W. B. Day, of Chicago; Maj. F. F. Russell, of Washington; Dr. C. G. Spalding, of New Haven; and Dr. W. E. Quince, of Chicago. The latter is said not to be eligible for membership in the committee, on the ground that he was not a member of the convention.

Anti-Narcotic Progress in China.

A resolution recently passed by the Chinese senate aims to suppress the sale and use of opium in the Celestial Empire by drastic means. The interprovincial transportation of the drug will be absolutely prohibited after July next, and beginning in January, 1912, the planting of poppy and the smoking of opium will be severely punished. An effort is being made to abrogate the opium treaty with Great Britain and thus prevent importations from India.

The British *chargé des affaires* at Hong Kong has promulgated a decree making punishable by fine and imprisonment the manufacture of any cocaine in China by a British subject or the importation of any cocaine by any one holding British allegiance. The provisions of this decree apply also to apparatus for the injection of cocaine.

New York Alumni Banquet.

What is said to have been the best attended and most successful annual dinner of the Alumni Association of the College of Pharmacy of the City of New York, Columbia University, was held in Healy's jungle room on the evening of December 7th.

The guest of honor and orator of the evening was Dr. H. W. Wiley, chief of the bureau of chemistry of the department of agriculture at Washington. He spoke of the pharmacist and his work and urged his hearers to uphold the ethical side of pharmacy. The trouble has been, he said, that for the sake of profit the pharmacist has been willing to sacrifice the nobler work of his profession. In his opinion profit which came from the sale of unethical preparations might better be left unmade. He cautioned the druggists against the sale of narcotic-laden medicines, and of beverages sold at the soda fountain which contain harmful drugs. The druggists, as men of education, he said, owed it to the public at large to protect the unsuspecting from harmful and injurious preparations.

In speaking of the relations between the professions of medicine and pharmacy, he wished to see the differences of the members of each harmoniously adjusted. He expressed a desire that the Pharmacopœia should be a book representing the harmonious collaboration of the two professions. While the contentions of the pharmacist may be right, said Dr. Wiley, he should remember and be ready to understand that perhaps his opponent may also be right and it is possible nearly always to tolerate and yet not to sacrifice principles.

He spoke of Ehrlich's discovery of the efficacy of dioxydiamidoarsenobenzol as a triumph in pharmacy. The demonstration of a discovery such as this, in his opinion, was ample proof of the need of co-operation and good feeling between the two professions.

Dr. H. H. Rusby spoke of the lack of knowledge among physicians with regard to drugs and medicines. He felt that from his experience as a teacher he was qualified to speak on the necessity of promoting good citizenship and high moral principles. The greatest reward, in his opinion, for effort expended was in being able to do something for others.

Albert Plaut said that he was an optimist and a firm believer in a great future for pharmacy, credit for which he felt was largely due to the pharmaceutical press and to the institutions of learning.

Among other speakers were Ewen McIntyre, J. R. Wall, A. S. Evans, president of the New York State Pharmaceutical Association, and C. A. Mayo.

Manhattan Association.

The first afternoon meeting of the Manhattan Pharmaceutical Association was held December 19th. It is expected that with the reduction of the dues from \$5 to \$2, the change in the hours of meeting, and the renewal of activity among the members in securing applications for membership, the association will once more become a factor among the pharmaceutical associations.

The changes in the by-laws necessary to the new order of things were discussed at length and will be acted upon at the next meeting.

It was decided to have application blanks printed and to supply the members with them.

F. N. Pond spoke of the ruling of the fire department which forces the druggist to pay \$50 a year for a manufacturer's license to prepare and sell insecticides of a combustible nature. He said that a grocer could carry in stock a barrel of gasoline, paying but \$10 for the privilege, and the druggist could sell insecticides of another's manufacture and carry them in quantities; but to prepare his own in any quantity was forbidden without a permit and the payment of the \$50 tax.

On motion of G. H. Hitchcock it was decided to appoint a committee to act in conjunction with committees from other pharmaceutical organizations in an endeavor to secure a modification of this ruling, or a different interpretation of it.

Much dissatisfaction was expressed with the small commissions paid by the telephone company to druggists having public telephones. A committee consisting of Charles H. Lowe, R. R. Smith, Louis Berger, and G. H. Hitchcock, was appointed to confer with a similar committee of the German Apothecaries' Society relative to a plan for bettering these conditions and securing a higher rate of commissions.

German Apothecaries' Society.

Discussion of the anti-opiate ordinance of the municipal board of health took up practically all the time of the November meeting of the New York German Apothecaries' Society. The subject was introduced in a report for the legislative committee by S. V. B. Swann. He presented the present status of the ordinance and expressed the belief that it would soon be modified in accordance with the desires of the conference of the local organizations.

E. C. Goetting replied at length to this report. His advice at the preceding meeting had been to lay the matter before the mayor, but it had not been agreed to. Personally he had proceeded in that fashion, and had received in reply a letter signed by the mayor himself, which was very encouraging, and he was convinced that the change of front on the part of the health department, announced by Mr. Swann, was to be contributed solely to his letter to the mayor. Energetic action on the part of the druggists against unjust attacks he thought absolutely necessary. He could not understand why THE DRUGGISTS CIRCULAR in its October issue had printed an editorial which designated the ordinance of the health department as a necessary measure (see the CIRCULAR for October, page 498). As the CIRCULAR was among the oldest pharmaceutical journals and, he said, in some circles passed as the most esteemed and influential, he thought it necessary to answer the views and attacks of this paper in an open letter, in order that the article might not harm the druggists during their endeavors to modify the law (see last month's CIRCULAR page 639).

Mr. Goetting strongly admonished those present to see to it that the pharmaceutical organizations of the city were united in a council of delegates, according to a plan which he had proposed two years before; for only in that way, said he, could the druggists gain and keep any advantage. Dr. W. C. Alpers and Felix Hirseman were also of this view; the latter especially regretted that Mr. Goetting's plan, which he had so warmly recommended at that time and which had received such favorable criticism in the pharmaceutical press, had not been carried out.

A committee of five was appointed to present nominees for the various offices of the society at the next meeting.

After the business meeting a "kommers" was held, with vocal and instrumental musical selections. A "trauerschoppen" was drunk to the memory of Prof. C. S. N. Hallberg.

The meeting held December 1st was the annual meeting and after the minutes of the preceding meeting had been read the treasurer gave a report of the year's financial matters, and several communications were read.

Chairman S. V. B. Swann, of the legislative committee, announced that there had been no new developments with regard to the anti-opiate ordinance of the board of health. He added that the pharmacist need not be at all uneasy about this ordinance, and if an inspector should buy paregoric or cholera drops and then, showing his credentials, ask under what right the pharmacist sold such substances without a physician's prescription, the seller need only point to his diploma, with the remark that the board of pharmacy had given him this right. If the pharmacist was certain that the customer was a spy sent out by the board of health, he should politely tell him so and emphatically order him out.

President George Kleinau, in his annual address, among other things, called attention to the activity of the pharmaceutical legislative committees, which after much exertion had succeeded in getting an acceptable pharmacy law passed. Although this law was not to him entirely ideal, yet it deserved, just as did the new board of pharmacy, the full support of all members of the society. He thought it would be desirable if one of the members of the board of pharmacy could give a report of the doings of that body every three months, in order that the society might have plenty of opportunity to work hand in hand with the board. According to his view, it was not now advisable or necessary to propose new laws, but efforts should be made to have the law requiring the certification of all sales of cocaine on prescriptions repealed.

He also called attention to the distinction attained by members of the society, three of them being selected as members of the board of pharmacy, and three being members of the general committee of revision of the Pharmacopœia. He asked that these members from time to time acquaint the society with the work in which they were engaged.

He expressed regret that none of the members had been elected to office in the New York State Pharmaceutical Association and advised a policy of "No representation, no donation."

In conclusion he thanked the pharmacal journals for their manifest interest in the affairs of the society.

The speaker of the evening, Prof. C. P. Wimmer, was introduced by Chairman Emil Roller of the scientific committee, and gave an interesting and instructive lecture on "The Chemistry of Alkaloids." An extended discussion followed the lecture, in which Dr. F. von Oefele and Otto Raubenheimer took a prominent part.

An appropriation of \$500 was made for the purpose of arranging a fitting celebration of the society's sixtieth anniversary in October next.

The society also decided to contribute \$1000 to the building fund of the proposed Deutsche Haus for the use of the United German Societies.

The election resulted in the uncontested return of the retiring officers to their several stations. The official family is constituted as follows: President, George Kleinau; vice-presidents, Dr. C. F. Klippert and P. F. Gebicke; recording secretary, O. P. Gilbert; corresponding secretary, E. A. Boetzel; treasurer, R. S. Lehman; architect, George Leinecker; librarian, G. C. P. Stolzenburg; and trustees, E. C. Goetting, C. F. Schleussner, and Otto Raubenheimer.

Sales of Solution of Hydrogen Dioxide in this State.

Solution of hydrogen dioxide when offered for sale in original packages has the status in this State of a proprietary medicine, that is it may be sold by others than registered pharmacists or druggists and elsewhere than in a pharmacy or drug store. This is the inference to be drawn from the fact that the appellate term of the State supreme court has confirmed the finding of the trial court in the case of the New York Board of Pharmacy against E. W. Woolworth & Co. (see the CIRCULAR for August, 1910, page 442).

No opinion was expressed by the appellate justices, who were unanimous in their decision that the lower court did not err in ruling that the supervision of a registered pharmacist was not necessary to the protection of the public health in the sale of original packages of solution of hydrogen dioxide.

New York Alumni Annual Ball.

The annual ball of the Alumni Association of the College of Pharmacy of the City of New York, Columbia University, will be given at the Eldorado Hall, Fifty-second street and Seventh avenue, on Wednesday evening, February 1st. The hall is one of New York's newest, where every convenience is at hand. Those who care to indulge in a good supper can do so there, and at any price.

It is the desire of the committee in charge to make this one of the best affairs that the association has ever had, and it cordially invites all the members and their friends in both the wholesale and retail trade to be present.

Tickets and full particulars may be obtained of Roy Duckworth, chairman, or George Hohman, secretary of the ball committee, 115 West Sixty-eighth street, New York.

Reception at the New York College.

Prof. C. E. Vanderkleed, of the Medico-Chirurgical College of Pharmacy, Philadelphia, will deliver a lecture before the alumni association of the New York College of Pharmacy, at the college building, 115 West Sixty-eighth street, on January 11th, at 8:30 p. m., on chemical and physiological standardization. After the lecture there will be a reception and dance, with refreshments.

All pharmacists interested are invited to come and to bring their wives, daughters, sisters and sweethearts; no special invitations are needed.

Adrian Paradis, the well known Brooklyn druggist, was recently appointed a member of a committee which will represent the people of the Rockaway suburbs in an endeavor to secure improvements for that section of the city. The slogan is "No taxation without improvement" and many of the Rockaway property owners and citizens are in favor of petitioning the legislature to separate the Rockaway portion of Long Island from the City of New York, and to permit it to be incorporated as a distinct balliwick.

A Scientific Institute for This City.

There is in the course of erection at 50 East Forty-first street, this city, a ten-story building which seems destined to serve well in the advancement of science in this country. This is the new building of the Chemists' Building Company, an organization that purposes the inspiration of chemical science and industry. The first five floors of the building will be occupied by the Chemists' Club and will afford all the appurtenances of a social club, together with a large auditorium for scientific meetings and ample space for a complete chemical library and museum. It is situated in close proximity to the Academy of Medicine, the new public library and the engineering society headquarters.

The five upper stories have been especially constructed for laboratory purposes, and will be rented either as entire floors, or in suitable subdivisions, to analytical, commercial or research chemists, physicists, bacteriologists, etc.; but not as manufacturing laboratories. They are provided with ventilating flues, water, gas and electric mains, steam, refrigerating and compressed-air lines, in suitable locations; but the tenants are expected to make their own connections and provide their own fixtures. It is intended to charge low rentals and in many ways facilitate the prosecution of scientific and industrial research.

Location in the building will afford command of a complete chemical library; opportunities for social and scientific intercourse; the natural meeting place for out-of-town chemists and manufacturers, for whom the club provides excellent apartments; possibility for reduction of laboratory expenses through co-operative installation of expensive apparatus. Its value to scientific pharmacists, pharmacologists, and pathologists is evident.

Brooklyn Druggists Enjoy Themselves.

As its first social effort the Long Island Drug Club, of Brooklyn, held a "smoker" on the evening of December 19th. A pleasing vaudeville entertainment had been provided and there were smokes of every sort and plenty of refreshments.

Aside from the acts of the professional talent there were contributions of entertaining and interesting talks by H. A. Metz, former city comptroller, Dr. Davis and others.

At the business meeting which preceded the festivities officers for the first fiscal year were elected as follows: President, Alexander Gardner; vice-presidents, J. P. Rippling, Clifford Barber, and Edward Schott; treasurer, A. H. Higbie; financial secretary, J. H. Lilienthal; corresponding secretary, R. E. Lutz; and directors, Otto Raubenheimer, G. C. Diekman, W. T. Creagan, and H. C. Maigs.

New York's Anti-Opiate Ordinance Still in Force.

At the regular meeting of the board of health of this city held December 20th, it was expected by many that some action would be taken toward modifying the much discussed anti-narcotic ordinance. A committee representing the pharmaceutical organizations of the city had been present at a hearing before the board just prior to this meeting. The subject was not taken up, however, at the regular meeting.

Just what the final outcome of the discussion of the ordinance will be seems at present to be a matter of debate, with the odds very much on one side.

Taking Care of Teeth.

School inspectors in this city report that 90 per cent. of school children are in need of the professional services of a dentist. Two dentists, Dr. H. L. Wheeler, of New York, and Dr. W. A. White, of Phelps, have been employed by the State to give public lectures on the subject of oral hygiene and the prevention of tooth decay and consult with local health boards and school authorities with regard to the inspection of the teeth of school children and the opening of free dental clinics.

It is reported that the text of the lectures on oral hygiene will be that a clean tooth never decays and that a lazy tooth becomes in time a decayed tooth.

Otto Raubenheimer, of Brooklyn, N. Y., a man of many parts, is not circumscribed by any geographical boundaries. He has recently received the diploma of a member d'honneur du Congres International de Pharmacie, 1910.

Kings County Society.

What the meeting of the Kings County Pharmaceutical Society, held December 13th, lacked in numbers it made up in enthusiasm and interest. The smaller than usual attendance was due no doubt to the holiday season.

The report of the treasurer, Adrian Paradis, showed a balance to the credit of the society of \$301.75, and to the credit of the Brooklyn college of \$11,497.94.

For the legislative committee, William Muir reported that a committee representing the conference of the pharmaceutical organizations of this city was invited to be present at an interview with the board of health sometime during the week. He also spoke of the Foster bill, which is again before congress, and which he said imposed a hardship upon the druggists in that it provides that wholesalers shall pay a tax of \$10 and the retailer a tax of \$1 for the right to sell narcotic drugs. He contended that the bill was objectionable not alone from the tax, but from the fact that to secure a license for the privilege of selling small quantities of such drugs as most druggists do, a bond must be furnished.

Mr. Muir, in behalf of the telephone committee, also reported that the public service commission had nothing to do with establishing or regulating the rates of commissions to be paid to those who have public telephone stations. The difficulty seemed to be that no special rate may be given, but that the rates of commission must be alike to all who operate pay 'phones. The committee hoped to be able to report an increase in commissions at the next meeting.

Charles Heimerzheim announced that the propagandic work of the trade matters committee was progressing and that the post cards for use by the members in calling the attention of the physicians to seasonable official preparations were ready for distribution.

A motion was made that the post cards be sent upon request to druggists who desired them, free of charge. There was some discussion as to the advisability of sending them free, many of the members feeling that the druggists would be willing to pay a nominal price for the cards. After some debate the motion was carried. An appropriation of \$100 was made for the work of the committee.

Otto Raubenheimer, chairman of the committee on pharmaceutical affairs, introduced J. Leon Lascoff, a member of the New York Board of Pharmacy, who read a paper on "Difficulties in Dispensing." This paper is given in full on page 19.

Joseph Kahn stated that he had found it practicable to make a mass of ichthyol with a little magnesium oxide and water, and to secure ichthyol in a powdered form by triturating it with three times its weight of magnesium oxide. [Magnesium oxide is not to be commended as an excipient because masses made with it generally do not disintegrate readily.]

Dr. E. W. Dietrich, in discussing the paper, emphasized the need of pharmacal training for medical students. So much necessary time, he said, was given over to the study of other sciences that the much needed pharmacal instruction was neglected. He said that the physician often showed his lack of pharmacal knowledge in writing prescriptions, and while this condition was deplorable, nevertheless, it was true. In speaking of incompatibles he was of the opinion that many of them were intended and when such was the case the druggist should ascertain the physician's intention before attempting to overcome the incompatibility in any way.

Both Mr. Lascoff and Dr. Dietrich were officially thanked by the society.

It was announced that E. L. King, of this city, would address the January meeting of the society on business-getting methods for retail druggists.

Because as they claim wood naphtha (wood alcohol) produces a speedier intoxication and costs much less than poor whiskey, the drinking of the poisonous spirit is reported to prevail to an alarming extent among the laborers employed along the aqueduct from the Catskills to this city. It is said that several deaths and many cases of severe illness have resulted. An effort is being made to stop the sale of wood naphtha to ignorant foreigners in the towns along the Hudson.

"My little dog has fleas"; the woman cried, "do give me something that will cure them, please." And then the puzzled drug store clerk replied: "What seems to be the matter with the fleas?"—*New York Times*.

Brooklyn Association.

A review of the present pharmacy law and in particular of such phases as seemed of the greatest interest, was the feature of the meeting of the Brooklyn Pharmaceutical Association held November 28th. The regular business of the meeting was hastened, the general report of all committees present being confined to a brief statement of progress.

President Emil Krausche introduced the speaker of the evening, Dr. G. C. Diekman, president of the New York Board of Pharmacy, who spoke on "Pharmaceutical Jurisprudence."

Dr. Diekman referred to the work of the national syllabus committee as being the first step in the unification of State board examinations throughout the country. He spoke of the difference in the application of the terms certificate and license, as understood in the pharmacy law; license referring only to the authorization of a person to practice pharmacy, and certificate applying to the store certificates or to the certificate of an apprentice. It had been found he said that it was almost impossible accurately to test an applicant's knowledge of pharmacy without a greater range of questions, and therefore the many optional ones in the new tests will better determine the ability of the candidate. He said that the law seemed to settle the question of the ownership of the prescription, giving the druggist the right to keep it. He believed that at some future time the doctor would be obliged to pass an examination for the privilege of dispensing medicines. In Pennsylvania he thought consideration was now being given to a law for that purpose.

Many druggists think, said Dr. Diekman, that a person buying poison must sign his or her name to the poison register, but such is not the case, and the druggist who fills in the blanks required in the poison register has fulfilled what the law requires of him. He called attention to the lack of a perfect definition of just what constituted a poison. He spoke of prescriptions calling for cocaine and said that although there was nothing to prevent the doctor writing repeat on a prescription calling for cocaine, yet for the druggist to refill it even then was an offense in the eyes of the law. He related the story of a physician who wrote a prescription for the treatment of a cough, which contained in each dose 1/256th of a grain of cocaine, among other ingredients. In this way the doctor had prevented the druggist from refilling the prescription and also the patient from passing it around among friends. He told of a druggist in this city who, it was reported, disposed of 247½ ounces of cocaine in a short period of time. This same man, he had been told, had purchased in October forty-five ounces in one day. Still another druggist, he said, in the down-town section of the city was reported to dispose of fifty ounces a month. An inspector of the board of health had been notified of this fact, he said, but took no action. He thought that while it might be hard to prove these statements because of a lack of legal evidence, he did not doubt the truth of them.

Dr. Diekman assured his hearers that all alleged violators of the pharmacy law would be given a hearing and that the endeavors of the board would be, to be as lenient as possible, feeling that it would be better to let several who were guilty escape than to punish one innocent one.

A discussion followed Dr. Diekman's talk and several provisions of the pharmacy law were made plain to those who did not fully understand them.

Dr. C. J. Hettesheimer was asked to address the meeting and spoke briefly. He said that pharmacy was not what it had been twenty-five years ago, when conditions were better. Out of the wreck of what was once a noble calling, he said, these association "propaganda" and "formulary" men were trying to rebuild standards, and their example was one which every druggist should heed and profit by. He hoped that the time was approaching when pharmacy would take its stand among the professions, but it would take time and patience; and he felt that like all ideals which are lofty, these things were not to be realized in a moment. Work together, he said, and in harmony, and success will be the result.

Dr. Diekman was officially thanked for his interesting and instructive talk, and was unanimously elected an honorary member of the association. Dr. Hettesheimer was also thanked for his remarks.

Resolutions were adopted in memory of Prof. C. S. N. Hallberg.

At a meeting of the association held December 12th the

reports of the officers were read and the annual election was held. The following officers were elected:

President, David Westheimer; vice-presidents, Fred Schaefer and S. E. Dorn; treasurer, W. L. Schneider; secretary, L. J. Cohen; board of directors, Emil Krausche and Robert Medl (with the president, the secretary and the treasurer).

Manhattan's Hotel World Has Its Drug Store.

Steadily is growing the tendency of the more affluent Manhattanese to free themselves from the burdensome upkeep of a house in town and to spend their between seasons in the luxurious hostelries of the city. This fact, together with the multitude of transients who flock to this city for commercial purposes, makes of some of the caravanseries little cities in themselves. And now one of these "cities," the Hotel Astor, Broadway, Forty-third to Forty-fourth streets, has its own exclusive drug store.

True, there are in hotel buildings in this and other cities drug stores patronized largely by the guests at the hotel. But the Astor store, the venture of F. K. James, is almost unique in that it has no entrance from the street, and caters only to the guests of the hostelry. The store is located in a room opening off from one of the main corridors, just across from the orangerie; and it is fitted up in harmony with the furnishings of the hotel.

The fixtures are of solid mahogany with a relief work of bronze filigree. The show cases are of the buffet style with sliding glass panels opening from the front and lighted by interior electric lights. The electric fixtures of the store are of antique design and in harmony with the entire scheme of arrangements. No proprietary nostrums are kept for sale, although a complete line of the James specialties is in evidence. The prescription department is a marvel in simplicity and convenience, and the cases are arranged at right angles to the windows for the conservation of daylight. No manufacturing is done in this store, but its proximity to the other stores of Mr. James make keeping up stock an easy matter. Obviously the dispensing of asafetida, iodoform or valerian is taboo in this fairyland pharmacy. As side lines there are toilet requisites, confections and cut flowers.

Under the supervision of Mr. James the store will be in charge of a capable manager, and while it is as yet an experiment, its reception so far by the hotel patrons gives every reason for believing it will be a success.

A New Store on the "Rialto."

One of the latest additions to the Broadway pharmacies of this city was opened December 14th, at 1259 Broadway by Haberman & Co. This store is known as "The Chemist Shop" and is fitted up very attractively. The side walls and ceiling are in white, and the fixtures, modern in style, are of dark mahogany. The cases are of the latest pattern and extend the full length on one side of the long room. On the other side are cases half-way down, and then individual display cabinets on pedestals.

No gilt-adorned shelf bottles are to be seen in the front of the store, the galenicals all being in the prescription department. This department is at the rear of the room and is separated from the main part of the store by a partition about six feet high. It is arranged with a view to making it as convenient as possible for the dispensers, and is light and roomy.

A new fountain is being built especially for the store and will be installed shortly.

In keeping with its location the store has a cosmopolitan staff of attendants, who are well acquainted with the ways of the London chemist, the Parisian pharmacien, and the foremost shops of the European capitals.

Merck's Offices Moved.

After having been located fourteen years in the Merck Building at University place and Eighth street, this city, Merck & Co. have moved their offices into new quarters at 45 Park place. This move had been contemplated for some time because it places the company in the center of the wholesale business district of the city and in closer communication with the works and laboratories at Rahway, N. J. This will mean a saving of much time.

Two large plate glass windows in the store of the Pope Drug Company, Broadway and One Hundred and Sixtieth street, this city, were broken by a severe wind storm recently.

To Continue the Milhau Policy.

Although the name of Milhau, long connected with the pharmacy of this city, is fast becoming a memory since the passing of the Milhau store told in the CIRCULAR some months ago, the Milhau policy is being continued by E. L. Ennis, for many years the manager of the Milhau store. Mr. Ennis has associated himself with the Bockar Drug Company and is now the president of the Bockar-Ennis Drug Company, incorporated, with a store in the pathway of thousands of commuters to New Jersey, at the corner of Liberty and Washington streets.

This is not a large store, neither does it aim to compete with the big downtown stores in a multitude of side lines. But it is a complete store, and the motto is "No substitution: We give you just what you ask for." Cigars and soda water are handled, the fountain being in charge of one of the Milhau trained dispensers. The prescription department, says Mr. Ennis, is something more than the stereotyped "specialty."

In the manufacturing laboratory many of the Milhau pharmaceutical specialties are made for the trade, and several Bockar preparations are manufactured.

Nine employees constitute the staff of the store.

Special Lectures at Medico-Chi.

A course of special evening lectures in practical chemistry is being given by the department of pharmaceutical chemistry of the Medico-Chirurgical College of Philadelphia. The lectures, which are free, are delivered in the lecture hall of the college at the corner of Seventeenth and Cherry streets, at 8 o'clock on Monday evenings. Yet to come are the following:

January 9th, "Food Inspection," by C. S. Brinton.

January 16th, "Commercial Bacteriology," by A. P. Hitchens, M. D.

January 23d, "A Phase of Pharmacology," by F. E. Stewart, M. D.

February 6th, "Manufacture of Pharmaceuticals," by W. A. Pearson.

February 20th, "Medicated and Surgical Plasters," by F. B. Kilmer, Ph. D.

February 27th, "Manufacture and Adjustment of Trusses," by Maurice Hallowell.

March 6th, "Custom House Chemistry," by C. C. Roberts.

March 13th, "The Influence of Climate on Plant Life," by W. P. Wilson, D. Sc.

March 20th, "Chemical and Colorimetric Examination of Coal," by R. H. Chapman.

April 3d, "Manufacture of Chemicals," by W. Graham.

April 17th, "Comments on the Correct Practice of Pharmacy," by Ambrose Hunsberger.

April 24th, "The Relation of Chemistry to Pharmacy and Medicine," by J. L. Turner.

Medico-Chi Banquet.

The annual banquet given by the seniors to the junior class of the department of pharmacy of Medico-Chirurgical College of Philadelphia, was held December 14th. The affair is said to have been one of the most enjoyable events of the college history.

Prof. I. V. S. Stanislaus acted as toastmaster, and among the speakers were Drs. Egbert McNeary and Pittenger for the faculty; Howard Aston Bruce Hicks, Robert Wheeler, R. P. Fischelis, Andrew Nealon, and C. Welsh for the seniors. A. O. Wickham and E. Cosgrove responded for the junior class.

Prof. Stanislaus spoke on "Nostrums," declaring that the trade-mark laws protect the nostrum-makers in disposing of worthless and sometimes injurious concoctions. He saw a better future through the influence of true-labeling laws and the freeing of certain classes of publications from subsidization to the nostrum-advertisers.

A promoter believed to be working in the interests of the Riker-Hegeman Company, of this city, is reported to have obtained options on twenty drug stores in Philadelphia. His plan is said to consist in forming a holding company to operate twenty-five stores and then to amalgamate the combination with the New York corporation.

James Falsgiver, of Pittsburg, Pa., so runs a recent news dispatch, sat before an open grate fire rubbing a rheumatic ankle with what he supposed was oil of turpentine. Instead it was gasoline, and it became ignited setting fire to the house and seriously burning Mr. Falsgiver.

Sharp & Dohme's Business not Affected by the Death of Louis Dohme.

Louis Dohme's death, owing to his keen foresight in years ago transferring the active management of his commercial affairs to his trusted associates, will not affect the business of Sharp & Dohme, a house with which he was closely associated during the major portion of his life. This business is conducted by a corporation of which the deceased was president; his brother, Charles E. Dohme, first vice-president; Dr. A. R. L. Dohme, only son of Charles E. Dohme, second vice-president; and Ernest Stauffen, secretary and treasurer.

Louis Dohme had not taken any active interest in business during recent years, preferring to place all responsibility upon the shoulders of the younger, more active members of the corporation and to spend a part of each year abroad. Dr. A. R. L. Dohme for many years has been in general charge of the laboratories. Mr. Stauffen, who joined the firm in 1876, has since then been in charge of its general business department, and since 1893 has managed the business from the general offices at 41 John street, New York.

It is understood that by his will Mr. Dohme, who was a bachelor, made bequests to all the members of the family, the bulk of the estate, which consisted chiefly of stock in the Sandee Company of Delaware, the holding company of Sharp & Dohme, going to Dr. A. R. L. Dohme.

Arizona Association Organized.

At a meeting of the Arizona Board of Pharmacy held in April, last, the members of that body deemed it worth while to strive for the organization of a State pharmaceutical association; and in September there was sent out to the druggists of the new commonwealth a call to organize themselves and become sharers in the benefits of association. Seventy-odd druggists replied in favor of the project, and the new association was launched at Phoenix, November 9th.

At this time and place a committee on constitution and by-laws was selected; and the association was formally organized by the election of the following officers: President, Harry Brisley, of Prescott; vice-presidents, E. J. Huxtable, of Douglass; H. B. Cate, of Phoenix, and W. Y. Hunter, of Flagstaff; and secretary and treasurer, R. P. Roziene, of Phoenix.

National Association of Pharmacologists.

A regular monthly meeting of the National Association of Pharmacologists was held at Columbus, Ohio, November 29th. State and county committeemen were elected and the report of the national organizer was read.

Communications were received and read from the National Pharmaceutical Society, of this city, looking toward affiliation or consolidation, and from the secretaries of various boards of pharmacy.

The association plans to take action relative to itinerant vender laws, after communication with those interested on both sides of the question.

A letter was read from the clerks of Cleveland, Ohio, opening negotiations for the organization of a local branch of the association.

The pharmaceutical press was officially thanked for its support.

Wedgewood Club Entertains.

About forty-five couples attended the euchre party and dance given by the Wedgewood club, of Brooklyn, December 15th. The reception hall of the Kaiser Haus was tastefully decorated for the occasion, and from a social point of view the affair was a decided success. There were six prizes for the card games. After the euchre, dancing was enjoyed until the early morning hours.

The committee on arrangements is receiving commendation for the pleasing manner in which the guests were entertained.

J. E. Boyle, of Fairfield, Conn., has been elected a justice of the peace. The newspapers have it that he is offering inducements in the way of automobile transportation, flowers, and candy to the patrons of his nuptial bureau.

W. W. Albers, of Wausau, Wis., a former president of the Wisconsin Pharmaceutical Association, now represents his district, the twenty-fifth, in the State senate.

Canadian Association.

The third annual meeting of the Canadian Pharmaceutical Association was held at Halifax in September, last. President Henry Watters, of Ottawa, Ont., in his address recommended better instruction for apprentices and better recognition for pharmacists in the government service.

Among the speakers were Prof. J. P. Remington, of Philadelphia, Pa., and J. E. Tremble, of Montreal.

Officers for the coming year were elected as follows: President, Robert Martin, of Regina, Sask.; vice-president, J. E. Tremble, of Montreal; and secretary and treasurer, G. E. Gibbard, of Toronto.

The 1911 meeting of the association will be held at Montreal.

Minneapolis Druggists' Banquet.

The annual banquet of the Minneapolis Retail Druggists' Association was held November 16th. Covers were laid for sixty, and C. H. Huhn presided as toastmaster.

The speechmaking was largely given up to the discussion of national legislation needed in pharmacy.

Prof. F. J. Wulling was the principal speaker of the evening and he argued particularly the need of patent laws that would protect not only the pharmacists but the people also, against the high prices exacted by foreign manufacturers of protected pharmaceuticals and chemicals. He compared the prices of several of these preparations in this country with the prices charged abroad, and said that this country gave more protection than any other to its patent-holders. In Germany, he said, the process of manufacture alone is patentable. He referred to the defeat of the Mann bill and quoted from THE DRUGGISTS CIRCULAR the sentiments of the pharmacists at large on the matter in question. Prof. Wulling advocated a change in the law which was provided for in the Mann bill and was to the effect that no patent should be granted upon products, but only processes; that no patent should be granted upon any invention or discovery which has been patented in any foreign country more than a year; and that when a patent is granted upon a process and the patentee does not manufacture such a substance within two years in the United States then any citizen may do so, or may import and sell it without interference.

Prof. Wulling spoke in favor of the establishment of a national bureau of health, but did not favor a department with a cabinet officer at its head.

He believed that the objections to a parcels post which pharmacists in general had might possibly be obviated if the delivery of parcels were confined to routes originating in the towns and going direct to rural consumers.

Among the guests and other speakers were United States Senator Moses Clapp, of St. Paul; G. H. Goodrich, of Anoka; State Senator McCall, of St. Paul; J. P. Jelinek, of St. Paul, president of the Minnesota Pharmaceutical Association and recently elected to the State legislature; and Messrs. Heller, Rietzke, and Aberwald, of the board of pharmacy.

Connecticut Clerks Organize.

After a lapse of about fifteen years the drug clerks of Hartford, Conn., have again become active in an organized effort to better themselves. The new organization, the Hartford Licensed Drug Clerks' Association purposes to furnish for its members social diversions and educational opportunities through lectures.

The officers are: President, J. J. Keefe; vice-president, L. H. Tracey; financial secretary, J. De Leo; recording secretary, C. S. Sheldrick; treasurer, Frank Tierney; board of governors, J. Foster, J. W. Ghent, Alexander Thompson, F. W. Dunn, James Lynch, and Richard Heffers.

Announcement has been made at Washington of the engagement of Dr. Harvey W. Wiley, chief of the bureau of chemistry of the department of agriculture, and Miss Anna C. Kelton, daughter of the late Adjt.-Gen. John C. Kelton, U. S. A. Miss Kelton has been quite active as a "suffragette."

Hynson, Westcott & Co., of Baltimore, have opened a new store at the junction of Linden and North avenues. This it is said is a new departure in drug store equipment for that section of the city, the interior being fitted largely in metal and stone. W. N. Owings, a member of the company, will be in charge.

New Year Reflections.

By ERNEST CRIPPS.

All business men agree as to the necessity of ascertaining the state of their finances and stock at some given date in the year, but not so many will admit the equal importance of an overhauling of the principles and methods upon which their business is conducted.

The end of one year, or the beginning of a new one, is not a bad time to undertake such a subjective stock-taking, and a short time may be profitably spent in thinking over some of the items on the balance sheet.

ATTENTION TO DETAILS.

How do we regard as pharmacists such an important item as attention to small details, for instance?

Most of us are keen on the bigger and more expensive lines we handle, but we are not always so careful in the smaller and possibly less profitable ones. We would not think of allowing a bottle of medicine to leave our pharmacies carelessly wrapped or finished off, but often think nothing of sticking one label over another, or allowing a dirty label to pass.

We think these things do not matter, or are unnoticed by our customers, but in this we are mistaken. Any ideas our customers may have about us have been slowly but surely formed by reason of these very omissions or commissions on our part, and they are all the stronger because they have been developed sub-consciously.

We cannot be too particular about small details; even if our businesses are thriving or our bank balances rising. The worm-eaten cork that breaks when a little pressure is brought to bear upon it, the piece of straw in the liquid we sell, the dirty window or case, the want of personal neatness or cleanliness on our own part; all these are noticed unerringly by our customers and are seed which will invariably in days to come result in a harvest that may give us a good deal of trouble.

A bottle carelessly labeled may stand on the mantle-piece of a cottage for years and proclaim to all those who see it that the pharmacist whose name it bears was lacking in neatness and a sense of proportion. It may have contained only a cheap tincture, but it is as powerful a weapon against him as though it had been filled with otto of rose.

QUALITY ABOVE ALL THINGS.

Then, too, how about a motto, "Quality above all things?" Are we as particular in this matter as we were when first we entered business? We are keen buyers, we would strive manfully to save a few cents per pound on our purchases, and in this we are right, provided we do not sacrifice the quality of the things we sell. And we must be persistent in looking out for quality, for one lapse on our part may undo the work of years. It is possible to buy compound licorice powder at ridiculously low prices, and we may be tempted to do so, thinking thereby we are saving. But in the long run it is the greatest folly, for we are supplying our customers with a preparation which they will find unsatisfactory, and our good name will suffer thereby.

One of the most honored of British pharmacists was asked the cause of his business success, and his reply, terse and to the point, was "I have always sold the best, irrespective of price."

The writer happened to be on a visit a few weeks ago to a small country town. There were several drug stores located there, creations of polished mahogany, plate glass and electric light. He asked to be taken to the principal pharmacy and was led down a back street to a small old-fashioned shop, of a style more than a quarter of a century old.

"This is where the medical men send their patients," said my guide.

"But why?" I asked.

"Because here they are always certain of getting the best drugs."

The moral is obvious.

INVIOABILITY OF A PROMISE.

And what about being men of our word? There is no finer trait of character than this in the moral world and it is equally true that in the business world the true and lasting successes have always been men of their word.

"I know you will send it, Mr. So and So," says a customer, "for you have never deceived me yet."

This testimony to our fulfillment of promises is surely

gratifying. Let us see to it that in the future we do not forfeit it.

If we have promised any article by a certain time we should make most strenuous efforts to obtain it, even although we suffer a financial loss thereby.

A story is told of the founder of one of the biggest retail businesses in Great Britain, that he once promised some goods by a certain time and found, when too late, that he had promised what he could not perform if he depended upon ordinary methods of transit. He was not to be beaten, however, for a special train was chartered and his contract faithfully carried out.

We can not all imitate his method, but we can all share his spirit.

MORE THAN MERE MONEY IN THE BUSINESS.

And another thought needs emphasizing, that is, that we should not be too grasping. True we are not in business for philanthropy—we "are out to make money"—but we can do this in a dignified and gentlemanly manner, and if possible, we should give customers the idea that we have a genuine and sincere interest in them and their wants, quite apart from any question of what Carlyle, in his grim way, once called a "cash nexus." Let them feel that they can come into our pharmacies to ask us questions and to get their wants supplied, but that we shall not press them to purchase articles they do not want, and even if they go away empty handed, having purchased nothing, we shall not be offended.

"I shan't go to Jones again," said a young woman, "he is always trying to sell me some things I don't want."

We must not be too harsh on Jones, for he, good man, was only doing what he thought best for himself and his family; but he was rather too insistent and so lost a customer.

We should always endeavor to satisfy our customers, although we may lose on some particular line or article. I recall that tooth brushes are occasionally brought back after a few days' wear with the complaint that the "bristles fall out." I always cheerfully exchange these, although it is quite possible that I may not get the same treatment from the manufacturer or wholesaler.

Sometimes there is a dispute concerning change or payment, the customer stating that she has paid more than she really has. It is better in such cases to concede the point, even if the pharmacist is certain he is in the right. A dissatisfied woman can do incalculable harm to a business, out of all proportion to the sum of money that caused her dissatisfaction.

RESTING ON OARS.

And finally, all readers who are in possession of thriving businesses should avoid resting on their oars. The man who is making his reputation has no time for this, but with success often comes lessening of endeavor. In business, as in morals, there is no standing still. If we are not pushing on, we are drifting back, and the business that stands still has commenced to degenerate.

Pharmacy is not played out, either in the old world or the new. Its roots are deep in the past, its fruitage is yet to be. And the man who engages in it, in the spirit of the ideas I have herein suggested, is on the road to success in a material sense, and will also have the satisfaction of knowing that he has handed on to his successor ideals which have stood and which will stand the only true test, the test of time.

The Johnston Pharmacy at Bucyrus, Ohio, has recently been entirely remodelled and is now resplendent in plate glass, electric lights and a harmony of colors. The Bucyrus local papers characterized as a most remarkable engineering feat the lowering of the floor sixteen inches without disturbing the stock or fixtures. The store is conducted by F. T. Johnston & Son.

Co-operative advertising is being used by the Chicago Retail Druggists' Association in an endeavor to stem the flow of business from the neighborhood drug store to the drug department of the department store. Copy is being used in the daily papers to set forth the advantages of dealing with the druggist who has a personal interest in his customers.

Walter S. Martin, of Hickory, N. C., has purchased the store of S. H. McNeely, of Canton. Mr. Martin will shortly move this store to new quarters being prepared for him. When stocked completely the store, it is said, will represent an investment of \$8,000.

Some Phases of Eastside Pharmacy.

Manhattan's east side has developed in the past decade an institution common in Oriental lands—the peddling herbalist. Of an evening, in the path of the home-returning throngs from the sweateries lining Broadway and adjoining streets one may see dozens of the itinerant drug sellers, each with a tray suspended from a neck-strap, using a pushcart. They peddle a couple of dozen or more herbal products, as for example, cassia fruit, chamomile flowers, sarsaparilla root, and peruvian bark, as well as cough lozenges, plasters and other simple remedies, and perhaps a few essential oils. For a long time these pedlers served also as an outlet for the surreptitious sale of cocaine. Maybe some of them do so still to a small extent, but the stringency of latter-day laws to prevent the sale of the "dope" has made them wary.

Of course the operations of dozens and scores of these perambulating drug-venders seriously affects the trade of the legitimate pharmacist. His sales of herbs, for instance, where he is in direct competition with the pedler, are almost nil. Here is the pedler retailing on a license—even if he has that—which costs him two or three dollars a year; while he has scant or no knowledge of the virtues and dangers of the drugs he sells, the pharmacist in a store, who may have spent almost a competence on his education, who has devoted years of arduous study to his chosen calling and has invested his all in his place of business, finds himself in recent years face to face with the serious menace of the curbstone drug retailer. And, as the regular pharmacist has learned to his discomfort, the competition problem is getting more and more keen, year by year, with the entry of more and more peddling pharmacists on the sidewalks. And the rivalry between the pedlers themselves for the 1, 2, and 3-cent sales is acute to a degree. Few persons are going to enter a drug store, to pay the minimum "nickel" or dime for an article, when they can get something which will take its place from the pedler outside for a couple of cents.

The drug pedler has no responsibility. In case attempt be made to arrest him for the inadvertent poisoning of a family, probably no sleuth could locate him—there are so many of them, and they are always on the shift. Even if the one wanted were located it would be almost impossible to establish his responsibility or prove he sold the drug which caused the trouble. On the other hand the legitimate pharmacist is always where he may be found, and as a matter of fact is often blackmailed by tricksters who threaten him with a suit for alleged damages.

Of all pharmacists in Manhattan, where the struggle of druggists for existence is naturally hard owing to legitimate competition, probably those on the east side have to face conditions worse than are to be found in any other section of the city. The fiercest of fierce competition is apparent there, regardless of the pedler-druggist factor. From time to time one may see a pharmacist and his stock-in-trade sold by a sheriff's officer. Such a sale is the drug pedlers' golden opportunity. They swarm around the auctioneer's desk like roaches in a pie-bakery. Valuable lots of merchandise go for next to nothing. In fact, the auction is often considered not worth while by the owners—so little is realized. For who (except a pedler) wants second-hand or stock-soiled or nobody-knows-how-old lots of drugs and sundries?

A couple of years ago the stock of one of the more important east side pharmacies was literally dumped out pell-mell on to the sidewalk. There was nobody to look after the effects. For the rest of the day groups of boys went through the different drawers and containers, looting them of all things tasting sweet, cramming their pockets with licorice, lozenges, jujubes, pastilles, and anything else resembling "candy"; and throwing back with evident disgust anything not tasting good. What internal troubles—if any—ever came to those youngsters thus partaking indiscriminately of pharmacists' candy-ware may be surmized. However, probably at the worst it only meant a few extra stomachaches. Later on the city dump-cart men treated the remnants of this pharmacy as a public obstruction, what no passerby had thought worth picking up going to the public limbo.

The corporation of Hegeman & Co., of this city, has appealed from the decree of the United States district court ordering it to carry out an agreement to purchase the Forty-second street store of J. Jungemann. (See last month's CIRCULAR, page 663.)

A. Ph. A. Officers Elected.

General Secretary Charles Caspari, Jr., of the American Pharmaceutical Association has announced the result of the balloting by mail for the officers who will serve the association during the year 1911-12. The selections are as follows:

President, J. G. Godding, of Boston; vice-presidents, Wilhelm Bodemann, of Chicago; C. M. Ford, of Denver; and Ernest Berger, of Tampa, Fla.; members of the council, E. G. Eberle, of Dallas, Tex.; J. M. Good, of St. Louis, Mo.; and G. F. Payne, of Atlanta, Ga.

The ballots numbered 1238, of which 225 were rejected in accordance with the resolution which was adopted at the last annual meeting that only such votes should be counted as were cast by dues-paid members. Eleven unsigned ballots also were not admitted.

The board of canvassers, C. B. Whilden, F. T. Green, and J. L. White, reported a total number of 1002 votes, of which six unmarked ballots and one written ballot were not allowed. These could not have made a material difference in the result. The vote in detail follows:

For president, J. G. Godding, 635; F. C. Godbold, 162; T. Ashby Miller, 98.

For first vice-president, Wilhelm Bodeman, 516; W. A. Frost, 252; G. C. Blakeley, 118.

For second vice-president, C. M. Ford, 406; F. W. Meissner, Jr., 302; F. A. Hubbard, 177.

For third vice-president, Ernest Berger, 387; Charles Holzhauer, 304; J. O. Burge, 191.

For members of the council (three to be elected), E. G. Eberle, 624; J. M. Good, 500; G. F. Payne, 322; Otto Raubenheimer, 308; E. H. Ladish, 260; A. M. Roehrig, 214; T. D. Wetterstroem, 176; E. C. Bent, 128; and Mathias Noll, 99.

Meetings of American Pharmaceutical Association Branches.

Nashville.—Official formulas formed the topic of discussion at the November meeting of the Nashville branch of the American Pharmaceutical Association, syrup of tolu, essence of pepsin, elixir of the phosphates of iron, quinine and strychnine, and elixir of terpin hydrate with heroine being the preparations dealt with.

J. O. Burge said that he had found kieselguhr an excellent filtering agent in making syrup of tolu. He uses half as much as the specified amount of magnesium carbonate, and gets a clear water-white syrup having a better flavor.

A sample of essence of pepsin exhibited by W. R. White had been made with a white sour wine detannated with milk. It had a very attractive appearance.

A number of those present discussed the question of making a satisfactory elixir of the phosphates. Mr. Burge got a better green color by omitting the ammonia water. R. L. Eves found that the darkening of this preparation was prevented by keeping it in a blue-glass bottle.

All of those present had been troubled by the sugaring-out of elixir of terpin hydrate with heroine. Mr. Burge suggested the following improved formula:

Terpin hydrate.....	265 grains.
Heroine hydrochloride.....	11 grains.
Alcohol	12 ounces.
Glycerin	12 ounces.
Syrup of wild cherry....	enough to make 32 ounces.

He dissolved the terpin hydrate in 8 ounces of alcohol; heats the glycerin to fuming; adds the remainder of the alcohol to this [probably losing much of the alcohol], and adds the solution of terpin hydrate gradually with shaking. In this mixture he dissolves the heroine, and adds the syrup when the mixture has cooled.

At the December meeting of this branch Prof. W. L. Dudley gave a lecture on "Radium, and Neon and Other Rare Gases." He told first of Ramsey's discovery of the rare gases in the atmosphere, and gave a somewhat detailed description of xenon, neon, argon, and krypton. He also told of the separation of helium by Hildebrandt and described this gas. Prof. Dudley thought neon might be used to make wireless waves visible.

The speaker related the history of radium and told how it was produced from uranium, and how in turn the radium was slowly broken up into its components. He described its physiological effects as similar to that of Roentgen rays. The beta rays of the radium emanation he said resembled electricity in a number of ways.

Adjournment was taken after the close of Prof. Dudley's lecture.

New York.—Practically the entire time of the meeting of the New York branch of the American Pharmaceutical Association held December 12th was devoted to the reading and discussion of a paper on "Some Difficulties Encountered in Complying with U. S. P. Requirements," which was presented by B. L. Murray. This was in the nature of a criticism of the indefiniteness and abstruseness of some of the official descriptions, and was not to any extent a condemnation of official standards.

He criticised the lack of descriptions of the powdered form of acacia, ammonium carbonate, cloves, and other botanical drugs. He also criticized the failure to recognize any but the large crystals of copper sulphate and the stick form of calcium chloride.

He also thought that in several instances—citing veratrine—the melting point was too definitely stated, and in others the same was true of the official figures for specific gravity—among these he mentioned benzaldehyde. The official solubility figures he considered wrong in many instances. Another fault instanced by the speaker was the failure to describe methods by which chemicals might be compared with official standards.

Mr. Murray argued that it was a waste of space to devote long monographs to the description of crude materials used almost entirely in the arts and seldom, if ever, used in their natural condition as medicaments. Among these substances he named metallic iron, mercury, animal charcoal, and zinc.

Prof. Virgil Coblenz, who opened the discussion of Mr. Murray's paper, thought that the revisers of the U. S. P. had acted logically in describing ammonium carbonate as they did and also in calling attention to its change to a powdered, deteriorated state. In determining which physical form of a substance would be recognized, he said that the revision committee had been obliged to decide arbitrarily sometimes. The official solubility figures, he stated, were obtained from manufacturers, their determination being too much for the committee in the time at its command. The committee had believed that the various analytical methods for medicinal chemicals were so well known as not to require repetition in the Pharmacopœia, but in the next revision these methods will be referred to by name. In his opinion, while a number of articles should be deleted from the official list, iron, zinc and mercury should be retained because they enter into so many medicinal compounds.

T. N. Dissosway also thought that there should be an official description of mercury because it is used as such in mercurial mass and in mercury with chalk. He did not consider official descriptions of powdered substances necessary.

Albert Plaut was of the opinion that there was need for improvement in the descriptions of botanical drugs. He favored the deletion of the monographs on crude materials and the description of each in connection with one compound into which it entered. The one-time difficulties in connection with the determination of melting points, he said, do not now exist because the revision committee is being assisted by all the laboratories of the country. He remarked that the food and drugs officials took cognizance of the fact that substances used in the arts need not comply with standards for medicinal grades of the same substances.

Cornelius DeJonge told of the difficulty experienced in obtaining scammony of the origin denoted in the Pharmacopœia, and of securing a stable lithium bromide complying with the official standard.

J. L. Lascoff thought that warning notes should be given in the U. S. P., such as a caution against accelerating the toxic action of oleoresin of aspidium [which has caused blindness] by combining it with an oil that dissolves the flicic acid.

J. L. Mayer expressed the desire that the Hehner method of ascertaining the iodine number of oils would be specified in place of the Hübl, and that a definite statement be made as to whether the determination of physical constants should be made with samples of chemicals as found in the market or with dried samples.

Otto Raubenheimer said that the pharmacopœial descriptions should be more definite, and that full attention should be given to powdered drugs. His hope was that the crude materials would be retained as at present. However, he wished to see a return to a standard temperature

for specific gravity determinations of 15° C. because of the difficulty of obtaining apparatus standardized at 25° and of comparing the specific gravities determined at different temperatures.

Joseph Weinstein was an advocate of animal charcoal, because he often gets prescriptions for it in combination. He favored the recognition of all medicaments, averring that in this way the nostrum maker is handicapped in making extraordinary claims for an unofficial drug.

John Roemer asked that full confidence be reposed in the revision committee.

After officially thanking Mr. Murray, the branch adjourned.

The next meeting, to be held January 9th, will be of a historical character. The paper of the evening will be "The Pharmacist in Ancient and Modern Times," by Dr. James J. Walsh, the dean of the medical school of Fordham University.

Northern Ohio.—The initial meeting of the Northern Ohio branch of the American Pharmaceutical Association for the season of 1910-11 was held at Cleveland, December 9th, with President L. C. Hopp in the chair. A review of some of the year's conventions was presented as follows: The American Pharmaceutical Association, by W. T. Hankey; the United States Pharmacopœial Convention, by L. C. Hopp; the National Association of Retail Druggists, by E. R. Selzer; and the Ohio Pharmaceutical Association, by Joseph Feil.

Secretary H. V. Army referred to some of the proposed changes in the National Formulary; and a general discussion of N. F. formulas and processes followed.

Pittsburg.—A very interesting paper was presented by Louis Emanuel, Jr., at the meeting of the Pittsburg branch of the American Pharmaceutical Association held December 13th. The subject was "A Few Observations Anent Higher Education, or Using One's 'Gray Matter' in Pharmacy."

Mr. Emannel brought out some very pertinent facts relative to what constitutes a really educated and trained pharmacist equal to the various tasks of daily drug-store service. The paper provoked quite an animated discussion. Profs. Koch, Judd, and Saalbach discussed its professional phases; and Andrew Campbell and B. E. Pritchard dwelt upon the commercial topics broached by the author.

Prof. J. A. Koch opened a discussion of matters relating to the revision of the Pharmacopœia, which was markedly instructive.

The branch agreed to a suggestion made by Mr. Campbell that those having knotty pharmacal problems send them to Secretary Pritchard for consideration at the meetings of the branch.

It was also planned to have demonstrations of microscopical examination of powdered drugs and the use of the polariscope at several early meetings.

The meeting concluded with a discussion of the project of a journal for the A. Ph. A.

Washington.—Standards for National Formulary drugs and the general principles involved in the revision of the N. F. formed the topics for discussion at the meeting of the City of Washington branch of the American Pharmaceutical Association.

Dr. L. F. Kebler, who was the first speaker, characterized as impracticable any attempts to provide tests for all possible forms of adulterations, and suggested the desirability of formulating standards of purity and introducing a general provision that would sanction the application of other tests to detect deleterious contaminations. As a general principle, particularly for chemicals, a purity requirement with definite limitations for poisonous contaminations would, in his opinion, perhaps prove most satisfactory.

Dr. V. K. Chestnut believed that there was a need for comprehensive official standards and tests. The economic conditions surrounding the supplying of medicinal substances make it necessary to call in the aid of the botanist, the microscopist, the chemist, and the pharmacologist. He thought that there was an unlimited field for the development of the chemical standardization of drugs.

For crude drugs, said M. I. Wilbert, it might be practicable even at the present time, to fix an equitable minimum limit of purity. Such a requirement could, of course, be established more readily for the more important and more widely used drugs than for drugs that have

but uncertain uses and are, therefore, of variable origin.

The influence of cultivation and transplanting upon wild drug plants was brought out by Dr. H. W. Wiley, who believed that until all drugs that are to be recognized as official are cultivated under conditions that will assure their absolute uniformity it will be necessary to provide for wise toleration and considerable variation in the crude drugs that come to our market.

Prof. H. E. Kalusowski said that the cultivation of medicinal plants appeared to have a tendency to increase the relative proportion of the active constituents, and referred to the improvements that have been made in connection with cinchona bark and the development of various hybrid forms containing either quinine or other alkaloids in excess.

Dr. M. G. Motter called attention to the desirability of materially changing the scope of the two books now recognized as the standards for drugs under the federal food and drugs act. The Pharmacopœia, he said, might well become the book of standards for recognized standard remedies, while, for insertion in the National Formulary, it might be found practicable to develop standards for all other drugs that are widely used regardless of the recognition that is given to them by laboratory workers and teachers.

In answer to an inquiry by one of the members it was announced that the American Pharmaceutical Association had definitely decided to include in the National Formulary formulas for all widely used preparations not included in the Pharmacopœia, and had also decided to provide standards for non-pharmacopœial drugs and chemical substances used in these several formulas.

The report of the special committee appointed at the October meeting to consider the project of a journal of the American Pharmaceutical Association was read by the secretary and unanimously adopted.

Embodied in this report were the following resolutions in memory of Prof. C. S. N. Hallberg:

Whereas, we, the members of the City of Washington Branch of the American Pharmaceutical Association, having learned of the death of C. S. N. Hallberg, a prominent member, and editor of the Bulletin, of our association, are desirous of expressing our appreciation of his long-continued and unselfish interest in everything pertaining to the advancement of the American Pharmaceutical Association and the progress of true pharmacy generally, now, therefore, be it

Resolved, That we hereby record our appreciation of his unflinching and untiring devotion to pharmacy, his singleness of purpose and the unquestioned probity which guided his every-day effort in securing for true pharmacy the recognition properly due it; and

Resolved, That a copy of these resolutions be embodied in our minutes and a copy forwarded to the family of the deceased as an expression of our sympathy and esteem.

The annual election of officers resulted in the choice of the following: President, Dr. Reid Hunt; vice-presidents, Lewis Flemer, Dr. L. F. Kebler, and A. C. Taylor; secretary, M. I. Wilbert; treasurer, W. H. Bradbury; committee chairmen: Membership, H. C. Easterday; legislation, W. S. Richardson; medical relations, F. C. Henry; and publicity, S. L. Hilton.

Romance is not dead—at least among drug clerks—and the newspaper writers of this city found a theme worthy of column articles in the honeymoon spent recently in a cave in the Catskill Mountains by a twenty-year old drug clerk, of Newark, N. J., and a nineteen-year old patroness of the soda fountain, who had eloped from forbidding parents. Cold weather and a scarcity of game brought about the abandonment of the cave-dwellers' life, an arrest for vagrancy, and a subsequent return to the conventionalities of civilization.

Shortly after the resumption of the sittings of the United States supreme court, January 3d, the case of the Miles Medical Company against the John D. Park & Sons Company will, it is expected, come up for hearing. This case, as has been reported on several occasions in the CIRCULAR, has to do with the legality of price-protection plans and the influence thereupon of unsubstantiated claims of remedial virtues for nostrums.

The Fortune-Ward Drug Company, of Memphis, Tenn., expressed its appreciation of the patronage extended to it by the medical profession during 1910 in a letter of greeting sent to the physicians of the city at Christmas time.

The new quarters of the New Orleans College of Pharmacy were formally opened with a reception by the board of trustees and faculty, November 29th.

News of the Pharmacy Boards.

List of Board Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

ALABAMA—February 15th, at Montgomery. E. P. Galt, Selma.

ARIZONA—April 12th, at Phoenix. A. G. Hulett, Phoenix.

ARKANSAS—J. F. Dowdy, Little Rock.

CALIFORNIA—January 10th, at Los Angeles, and January 15th, at San Francisco. Louis Zeh, San Francisco.

COLORADO—S. L. Bresler, Denver.

CONNECTICUT—March 7th, at Hartford. J. A. Levery, Bridgeport.

DELAWARE—January 5th, at Newark. Albert Dougherty, Wilmington.

DISTRICT OF COLUMBIA—January 12th and 13th, at Washington. S. L. Hilton, Washington.

FLORIDA—January 23d, at St. Augustine. D. W. Ramsaur, Palatka.

GEORGIA—C. D. Jordan, Monticello.

IDAHO—April 11th, at Idaho Falls. J. M. Starrh, Shoshone.

ILLINOIS—F. C. Dodds, Springfield.

INDIANA—January 10th, at Indianapolis. W. H. Rudder, Salem.

IOWA—February 7th, at Des Moines. E. J. Moore, Des Moines.

KANSAS—February 15th, at Wichita. W. E. Sherriff, Ellsworth.

KENTUCKY—January 10th and 11th, at Covington. J. W. Gayle, Frankfort.

LOUISIANA—F. A. Earhart, New Orleans.

MAINE—F. H. Wilson, Brunswick.

MARYLAND—April 12th and 13th, at Baltimore. Ephraim Bacon, Roland Park.

MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.

MICHIGAN—January 17th to 19th, at Ann Arbor. E. J. Rogers, Port Huron.

MINNESOTA—January 16th, at Minneapolis. C. T. Heller, St. Paul.

MISSISSIPPI—April 4th, at Jackson. L. H. Wilkinson, Greenwood.

MISSOURI—January 9th, at Jefferson City. C. E. Zinn, Kansas City.

MONTANA—T. M. Kehoe, Billings.

NEBRASKA—February 7th to 9th, at Omaha. A. V. Pease, Fairbury.

NEVADA—R. L. Prouty, Tonopah.

NEW HAMPSHIRE—January 18th, at Concord. F. H. Wingate, Nashua.

NEW JERSEY—January 19th, at Trenton. H. A. Jorden, Bridgeton.

NEW MEXICO—A. J. Fisher, Santa Fe.

NEW YORK—February 1st and 2d, at New York, Albany and Buffalo. W. L. Bradt, Albany.

NORTH CAROLINA—F. W. Hancock, Oxford.

NORTH DAKOTA—March 21st, at Fargo. W. S. Parker, Lisbon.

OHIO—January 10th and 11th, at Columbus. F. H. Frost, Columbus.

OKLAHOMA—January 10th and 11th, at Oklahoma City. J. C. Burton, Stroud.

OREGON—December 13th and 14th, at Portland. C. G. Huntley, Oregon City.

PENNSYLVANIA—February 18th, at Harrisburg. L. L. Walton, Williamsport.

RHODE ISLAND—February 7th, at Providence. J. E. Brennan, Pawtucket.

SOUTH CAROLINA—March 15th, at Charleston. F. M. Smith, Charleston.

SOUTH DAKOTA—January 18th and 19th, at Pierre. E. C. Bent, Dell Rapids.

TENNESSEE—January 17th, at Nashville. I. B. Clark, Nashville.

TEXAS—January 17th, at Dallas. R. H. Walker, Gonzales.

UTAH—January 17th and 18th, at Salt Lake City. W. H. Dayton, Salt Lake.

VERMONT—January 3d, at Montpelier. D. F. Davis, Barre.

VIRGINIA—January 3d, at Richmond. T. A. Miller, Richmond.

WASHINGTON—P. Jensen, Tacoma.

WEST VIRGINIA—May 5th and 6th, at Wheeling. A. Walker, Sutton.

WISCONSIN—January 10th and 11th, at Madison. Edward Williams, Madison.

WYOMING—C. B. Gunnell, Evanston.

Alabama Board.

Twenty-three years is a long term of office, and at the October meeting of the Alabama Board of Pharmacy, E. P. Galt, of Selma, was elected secretary for the twenty-third time. The other members of the board are W. E. Bingham, of Tuscaloosa, president; L. C. Lewis, of Tuskogee, treasurer; S. A. Williams, of Troy; and W. A. Thomason, of Guntersville.

The next meeting of the board will be held at Montgomery, February 15th.

Kansas Board.

One hundred and thirty-one merchants' licenses were granted by the Kansas Board of Pharmacy during the quarter ending November 16th; eight pharmacists were restored to registration; two received temporary certificates and one was granted a duplicate certificate.

The following graduates of recognized schools of pharmacy were registered without examination:

K. L. Hersh, of Wamego; and L. C. Runyon, of Lawrence.

There were thirty-eight applicants for registration, and of this number the following were successful:

J. C. Beaver, of Hewins; Pearl H. Brown, of Kansas City; Josephine Burke, of Scammon; E. A. Crawford, of Pittsburg; W. A. De Lapp, of Weir; A. M. Drees, of Kansas City; C. W. Evans-Lombe, of Edna; G. C. Fuller, of Hoisington; Sister Mary E. Hackett, of Pittsburg; B. D. Harrison, of Atchison; G. T. Howe, of Belleville; M. J. Kane, of Scammon; M. F. Reagan, of Leavenworth; L. J. Supple, of Solomon; S. E. Thomas, of Kansas City; W. H. Varnum, of Lawrence; J. T. Wills, of Pittsburg; C. C. Worley, of Kansas City; and H. C. Wrench, of Beloit.

The next meeting of the board will be held at Wichita, February 15th.

Massachusetts Board.

At the two examinations conducted by the Massachusetts Board of Pharmacy at Boston, during the month of November, the following candidates for registration were successful:

As pharmacists—W. B. Burke, of Lowell; D. F. Callahan, of Woburn; E. A. Johnson, of Chelsea; Mary D. Lang, of Lowell; W. J. Murray, of Natick; Mark Shaw, of Lynn; J. H. Tancrede, of Holyoke; and A. L. Walsh, of New Bedford.

As assistants—C. W. Ashley, of Attleboro; C. B. Carlsen, of New Bedford; B. P. Keyes, of Swampscott; L. F. Kilham, of Beverly; J. I. Lawlor, of Lawrence; T. J. Mullarkey, of Haverhill; Daniel Reidy, Jr., of East Weymouth; and S. J. Smith, of Lawrence.

At a meeting of the board held December 6th officers were elected for the ensuing year as follows: President, E. O. Engstrom, of Pittsfield; and secretary, P. J. McCormick, of Cambridge.

December 7th, A. J. Brunelle, of Fall River, was appointed by Governor Draper to succeed C. F. Ripley, of Taunton, whose term of office expired this year. Under the law members of the board may not be reappointed to succeed themselves.

Nebraska Board.

Seventeen of the twenty-eight applicants for registration were successful at the meeting of the Nebraska Board of Pharmacy held November 9th, at Lincoln. They were:

Mary Boler, of Omaha; R. J. Brown, of Scottsbluffs; E. M. Chamberlann, of Council Bluffs, Iowa; A. J. Farnham, of North Bend; Ernest Jensen, of Emerson; D. M. Kelam, of Franklin; J. P. Kent, of Sioux City, Iowa; C. M. Krebs, of Albion; D. J. Ledwich, of Broken Bow; C. A. McCarthy, of Omaha; L. E. McGee, of Nelson; O. L. Martellar, of Wilcox; H. L. Paden, of McCook; M. C. Ritter, of Omaha; A. J. Robertson, of North Bend; R. E. Roche, of Kimball, and T. C. Ross, of Omaha.

At this meeting of the board it was announced that J. E. Harper, of Clearwater, took his place as a member of the board to fill the vacancy caused by the retirement of C. R. Sherman, of Omaha. Officers were elected as fol-

lows: President, A. V. Pease, of Fairbury; vice-presidents, Herbert Locke, of Central City; and J. E. Harper, of Clearwater; treasurer, D. J. Killen, of Adams; and secretary, Frank Koss, of Fremont.

In conjunction with this meeting there was held a reunion of the ex-members of the board, and a banquet was given to the members and their wives. The present board presented to its retiring president, C. R. Sherman, a large leather chair as evidence of its esteem.

The ex-members formed an "old guard" and elected officers as follows: President, D. J. Fink, of Holdrege; and secretary, H. L. Harper, of Beatrice.

The board will hold its next meeting for the examination of candidates February 7th to 9th, at Omaha.

North Carolina Board.

Out of a class of fifty-nine thirty-seven succeeded in passing the examinations conducted by the North Carolina Board of Pharmacy at the meeting held November 15th at Raleigh. The names of the successful ones follow:

T. J. Aiken, of Raleigh; O. T. Alexander, of Charlotte; S. A. Chalk, of Edenton; W. B. Cherry, of Winston-Salem; C. B. Clark, of Durham; H. M. Cole, of Carthage; Henry Coleman, of Chapel Hill; Carl Finger, of Stanley; W. S. Frieze, of Concord; C. I. Godwin, of Pine Level; L. I. Grantham, of Dunn; L. E. Hesterly, of Hendersonville; J. B. Jones, of Fair Bluff; Agnes H. McDonald, of West Durham; W. F. Matthews, of Siler City; J. E. Murry, of Durham; C. B. Phillips, of Lincolnton; H. C. Reece, of Raleigh; Z. B. Rucker, of Charlotte; W. M. Sally, of Statesville; E. G. Scott, of Spray; C. N. Smith, of Southern Pines; J. H. Stimson, of Statesville; H. R. Stowe, of Belmont; K. N. Summey, of Dallas; D. G. Taylor, of Leaksville; E. N. Tillett, of Durham; G. S. White, of High Point; A. H. Williams, of Oxford; H. W. Wohlford, of Charlotte; and I. L. Zuckerman, of Durham.

Pennsylvania Board.

At the November examinations conducted by the Pennsylvania Board of Pharmacy at Philadelphia and Pittsburg, the following applicants for registration were successful:

As pharmacists—N. H. Anthony, L. F. Flinkman, C. R. Getz, P. C. Hill-Webb, G. B. Hulick, W. W. Keys, W. E. Klopp, M. L. Mallas, John Shober, and A. F. Stedem, all of Philadelphia; A. H. Hollstein, James McClaren, Fred Reif, L. M. Shear, Joel Sissman and C. E. Snyder, all of Pittsburg; R. L. Houck, of Purchase Line; R. H. Hutzler, of Butler; C. R. Johnson, of Scranton; H. W. Kintner, of Easton; A. J. Owen, of Erie; Christopher Schuehle, Jr., of Williamsport; E. K. Stratton, of Salem, N. J.; J. S. Sutton, of Butler; Frank Taylor, of Canonsburg; F. A. Treichler, of Norristown; J. C. Wajert, of Heidelberg; and Harry Weis, of Scranton.

As assistants—H. L. Adams, R. L. Bellenglin, Oscar Briskin, R. L. Butler, H. W. Cole, Emanuel Cooper, A. R. Crouse, R. F. Fischelis, H. B. Ford, W. G. Fleckinger, J. H. Geiger, Robert Gracey, Leo Greenstein, Max Keiser, Isador Klebanoff, M. S. Knauf, Isador Lehrman, Rebecca Levy, J. M. Miller, E. A. Mullen, Mabel Nelson, W. J. Oakes, G. M. Peberdy, Louis Poulshock, S. P. Reimann, A. L. Scilipoti, B. H. Shubert, Benjamin Shur, and Arthur Swanbach, all of Philadelphia; H. J. Brandt, J. F. Christley, C. R. Joliff, W. H. McDonnell, and F. H. Masterson, all of Pittsburg; E. M. Baker, of Ingraham; Malcolm Beach, of Cynwyd; Walter Bixler, of Homestead; Charles Brown, of Reading; R. G. Buckalew, of Bloomsburg; A. R. Calkins, of Wilkes-Barre; P. S. Cutter, of Burlington, N. J.; R. W. Downs, of Sunbury, D. E. Edwards, of Johnstown; N. M. Elsby, of Scranton; C. T. Gilbert, of Danbury, Conn.; C. F. Griffiths, of Beverly, N. J.; J. L. Grimm, Jr., of Wilmerding; Frank Hasenflug, of Lakewood, N. J.; E. F. Henning, of Baltimore, Md.; B. M. Hicks, of Benwick; W. F. Hitzelberger, of Bala; E. J. Hughes, of Wilkes-Barre; H. A. Jenks, of Findlay, Ohio; O. E. Johnson, of Erwin; F. H. Jolley, of Franklin; S. A. Kern, of Schenckville; H. J. Koch, of Coopersburg; A. J. Kossler, of Crafton; K. A. Krayner, of Columbiana, Ohio; B. C. Leemhuis, of North East; P. L. Leidich, of Harrisburg; H. M. Long, of Lewes, Del.; A. W. McGuire, of Pleasantville; J. A. Moon, of Athens; W. V. Moyer, of Bloomsburg; C. V. Pease, of Coatesville; R. E. Phillips, of Lewistown; H. L. Poffenberger, of Lydia, Md.; W. H. Puterbaugh, of Carrick; A. R. Sasse, of Kansas City, Mo.; I. S. Shaffer, of Somerset; C. M. Shull, of East Downingtown; R. A. Smith, of Beth-

Iehem; E. C. Snyder, of Yoe; W. G. Stauffer, of New Holland; J. S. Tyson, of East Downingtown; G. L. Watts, of Middletown, N. Y.; F. H. Weaver, of Baltimore, Md.; H. P. West, of Sistersville, W. Va.; C. J. Wisor, of Punxsutawney; and G. F. Young, of Dravosburg.

The next meeting of the board will be held at Harrisburg, February 18th.

Rhode Island Board.

But six candidates succeeded in passing the examinations concluded by the Rhode Island Board of Pharmacy, December 6th, at Providence. Their names follow:

P. H. Brady, J. S. Darcy, Arthur Girard, J. P. Head, J. E. Matteson, and J. H. Young.

South Carolina Board.

At the meeting of the South Carolina Board of Pharmacy held November 16th, at Charlestown, the following candidates for registration were successful:

R. L. Burnett, of Columbia; R. C. Davenport, of Ellenton; V. H. Gregory, of Clio; J. M. Horton, of Belton; J. P. Key, of Union; L. J. Nettles, of Harvin; D. F. Sanders, of Timmonsville; and C. L. Thomas, of Sharon.

The next meeting of the board will be held at Charleston, March 15th.

New England Association of Pharmacy Boards.

The annual meeting of the New England Association of Boards of Pharmacy was held at Boston, November 28th. The States represented were Connecticut, Maine, Massachusetts, New Hampshire, and Vermont.

Officers were elected as follows: President, J. R. Leverty, of Connecticut; vice-president, D. F. Davis, of Vermont; and secretary and treasurer, F. W. Bucknam, of Maine.

British Physicians Would Restrict the Sale of Nostrums.

Nostrums came in for a good share of condemnation in the reports on hygienic and medical economies recently collected by the British privy council from the medical officers of local boards of health. Opiate teething powders and soothing syrups for children were particularly condemned.

Some of the suggestions for remedying conditions were the following:

To compel the statement of the composition of all advertised medicaments.

To oblige venders of nostrums to pay for the analysis of their wares by the government analysts.

To prohibit the sale of headache powders and the like.

To regulate the sale of infant foods.

In the annual report of the federal bureau of fisheries to the department of commerce and labor the sponge-protecting act of 1906 is declared to be futile. This act does not prohibit the wanton devastation of sponge beds but seeks to prevent it by prohibiting the sale of sponges of less than a specified diameter. This process has not been found practicable because the bureau has no machinery for the enforcement of the law. The commissioner asks that the defects be remedied and also that the taking of sponges less than 5 inches in diameter be declared illegal.

It is reported that a Parisian publisher will shortly issue a Poliglota Vade-Mecum de Internacia Farmacio to contain (1) the weights and measures, monetary tables, and specific gravity factors of the various countries; (2) comparative tables of the galenicals given in different pharmacopœias; (3) formulas for unofficial medicines; and (4) a vocabulary in nine languages, English, French, German, Spanish, Dutch, Italian, Russian, Swedish, and Esperanto.

The German imperial commission, which has for two years been conducting an inquiry into the possible connection between the Carlsbad mineral springs and the coal mines at Falkenau, has decided that the application of the Britannia mines to be allowed to continue the pumping of waste water should be refused on the ground that the springs might suffer as a consequence of the pumping.

"Jobber," writing to the *Oil, Paint and Drug Reporter*, of this city, wants a "pure food and drugs" law for sponges. He thinks that it is time to call a halt on the "trade custom" of weighing in four or five pounds of bur-lap, shells, rope, etc., with each 25-pound bale of sponges.

Obituaries.

LOUIS DOHME.

One of the master minds of pharmacy was stilled when, on December 12th, Louis Dohme, of Baltimore, breathed his last. Mr. Dohme had been ill for a number of weeks, and so it can not be said that his death was unexpected, yet the news of the end came as a shock to his family, his friends and the trade generally. The attack of neuritis which marked the beginning of his end occurred in October while he was on the Atlantic bound for home. After treatment in New York he was taken to a hospital in Baltimore, where in spite of the best skill and attention he gradually sank.

The deceased was born July 6th, 1837, at Obernkirchen, Germany. With his parents and several brothers and a sister, he came to America at the age of fifteen, landing at Baltimore where he became acquainted with the late Alpheus P. Sharp, who at that time conducted a pharmacy at the corner of Howard and Pratt streets, that is on the exact site of the present extensive laboratories of Sharp & Dohme. Mr. Dohme even at that early age had a pronounced liking for the drug business and he therefore

LOUIS DOHME.

accepted the position of assistant offered to him by Mr. Sharp, and thus began the association which eventually developed into the foundation of one of the most widely known firms of manufacturing pharmacists in this country. Mr. Dohme studied pharmacy in all its practical details under the skilled tutelage of Mr. Sharp, and after attending the prescribed course of lectures at the Maryland College of Pharmacy was graduated by that institution in 1857.

Four years after his graduation Mr. Dohme became a partner of his old preceptor, the firm of Sharp & Dohme having been formed in 1860, and his business foresight was such that he soon began to enlarge the store's manufacturing laboratory and offer its output to other druggists. His younger brother, Charles E., having also been graduated by the Maryland College of Pharmacy, later became a partner in the business, which continued to expand. Louis Dohme, manifesting a preference for the business side of the undertaking, went out to put the products of the firm on the market. For a time he was the only salesman so engaged. He showed extraordinary ability, backed by indefatigable industry. With rugged strength and a determination to achieve he combined an ingratiating manner which instantly gained him a hearing. Mr. Sharp retired from active business in 1885, and in 1892 the firm became a company, with Louis Dohme as president, a position he held until his death. He was an organizer of

splendid ability, having had unerring judgment in the selection of the right men for assistants.

Of late Mr. Dohme had been less active in the business management of his company, poor health compelling him to spend much time in rest and at European resorts. His extensive travels, wide reading, and natural taste and inclination made him an unusually broad-minded and well-informed man. His private library was large and showed a discriminating taste, and his love of the best in music induced him to become a liberal patron of that art. He also possessed a good knowledge of paintings and sculpture, and was in all respects an entertaining and highly intelligent associate, in addition to being a sincere friend and a most delightful and warm-hearted companion. While Mr. Dohme was not a man who sought the lighter side of social life, he held membership in the Germania Club of Baltimore, the most exclusive organization among the Germans of that city, where he came in close contact with the most cultured of those who, like himself, had come from the Fatherland. He was also a member of the Baltimore Country Club.

In 1875 Mr. Dohme was elected president of the Maryland College of Pharmacy, which position he held until 1890, when he was succeeded by his brother, Charles E. Dohme, who remained at the head of the institution until its absorption by the University of Maryland. He was a life member of the American Pharmaceutical Association, having joined that organization in 1859, when it was only seven years old. He was a member of the United States Pharmacopoeial conventions of 1880 and 1890, and a member of the committee of revision of the convention of 1880, in which position his careful and accurate work proved of much value. Mr. Dohme was also one of the three members of the first board of pharmacy created by the laws of Maryland, which had jurisdiction in the city of Baltimore only. The deceased was a bachelor and made his home with his brother, Charles E. Dohme. He is survived by two brothers and a sister, besides six nephews and the same number of nieces. His funeral, held December 15th, was largely attended, the Department of Pharmacy of the University of Maryland having been represented by nearly all its faculty. The honorary pallbearers were Henry G. Hilken, Ernest Schmeisser, Carl Ruhstrat, H. B. Gilpin, Dr. John F. Hancock, G. Frank Baily, John C. Muth, George Bucheister, John Hinrichs, John H. Winkelmann, Prof. Charles Caspari, Jr., and Judge George M. Sharp, the latter a son of the late A. P. Sharp, the old employer and partner of the deceased.

NEWLANDS HAYES.

Newlands Hayes, of Detroit, founder of the *Retail Druggist*, died November 19th, 1910, aged sixty-five years. He was born at Pickering, Ont., and came to the United States in 1883, where he engaged in the retail drug business until about fifteen years ago.

In the days of the old Interstate Retail Druggists' League, one of the various forerunners of the National Association of Retail Druggists, Mr. Hayes worked diligently to have the druggists adopt a "plan" advanced by him to prevent the cutting of prices. This plan included the purchase of stock in the Universal Trade Association and was not endorsed by the league.

The following are the recently reported deaths of other persons in the pharmaceutical world:

WILLIAM W. BARTLETT, of Roxbury, Mass., December 1st, aged sixty-four years.

MELVIN E. CORNWALL, of Theresa, N. Y., aged seventy-eight years.

JOSEPH F. DIGNAM, November 24th, at Manchester, N. H., aged forty-seven years.

LEON C. FINCK, at Detroit, Mich., November 25th, aged fifty years.

AUGUST FRANCK, aged seventy-two years, at Chicago.

ROSENDO G. GONZALES, of San Antonio, Texas.

ROBERT S. GRANT, of Norfolk, Va.

EDWIN W. GRAVES, aged seventy-five years, of this city, December 6th.

C. H. HARVEY, aged forty-five years, of Lancaster, Mass.

Dr. W. J. HEADRICK, of Logansport, La., November 2d.

WILLIAM F. HEAGNEY, aged forty-four years, of Salem, Mass.

Dr. W. A. KNAPP, of Lake Charles, La.

WILLIAM LORENTZ, aged forty-nine, of Milwaukee, Wis.

WILLIAM G. MORRIS, aged seventy-two, of Chicago.

CARL OVERMEYER, December 7th, at Brooklyn, N. Y.

SMITH W. PERRY, of Jamaica Plains, Mass., at Lynn, Mass., November 3d.

WILLIAM REYNOLDS, of Bristol, Conn., aged sixty-eight years.

EDGAR SWADLEY, of Wabash, Ind., aged fifty-two years.

GEORGE TICHNOR, aged fifty-nine years, at St. Paul, Minn., November 24th.

W. H. VINCENT, at Polo, Mo., aged seventy-five years.

J. H. VON STEIN, of Columbus, Ohio, November 14th. He was one of the founders of the Ohio Pharmaceutical Association and for eighteen years its treasurer.

DAVID C. WEAVER, of Ft. Worth, Texas, November 6th, aged forty-five years.

J. LEROY WEBBER, of Brooklyn, N. Y., aged fifty-seven years, November 25th.

ROMANTA WELLS, aged seventy-six years, at Chicago.

Hugh Craig, a member of the staff of the CIRCULAR, and secretary of the New York branch of the American Pharmaceutical Association, was called to his old home at Hollidaysburg, Pa., during the holidays, by the death of his father on Christmas day. He has the sympathy of many friends.

According to a statement issued by the National Association for the Prevention of Tuberculosis, the sum of \$15,000,000 is collected annually from tuberculosis sufferers by those who exploit and advertise "fake" consumption cures. For this vast sum, the report says, the victims receive nothing in return, but are often permanently injured, even in many cases being deprived of the chance of being benefited by proper treatment. The association has recently issued a pamphlet of directions for living and sleeping in the open air, which may be obtained upon of his father. He has the sympathy of many friends.

The Druggists Circular

Entered at the New York Post Office as second-class matter.

ESTABLISHED 1857.

Published monthly at
100 William street, New York, by
THE DRUGGISTS CIRCULAR,

William O. Allison, President and Treasurer.
D. G. Bogert, Secretary.

Address all communications to The Druggists Circular.

Subscription Rates.

For the United States and Mexico, TWO DOLLARS PER YEAR; if paid in advance, ONE DOLLAR AND FIFTY CENTS. Foreign and Canadian subscriptions, \$2 a year, payable in advance. Remittances should be made by Check, Express Order on New York, Post Office Order or Draft on New York, payable to The Druggists Circular.

Net Advertising Rates.

Special prices are charged for preferred positions.

Changes for standing advertisements should reach us before the TWELFTH of the month, as we commence printing on that date. New advertisements sent in before the 23rd of any month can be inserted in the following issue.

No order given to any representative of this paper becomes binding until approved by the publisher or manager.

Questionable or undesirable advertisements will not be accepted.

Classified Opportunities.

Advertisements are inserted under this heading without display except as to a portion of the first line; the charge is at the rate of 25 cents for six words, each figure, abbreviation or initial being considered one word. Terms: invariably cash with order.

THE DRUGGISTS CIRCULAR

A Practical Journal of Pharmacy and General Business Organ for Druggists

VOL. LV. NUMBER 2.

NEW YORK, FEBRUARY, 1911.

WHOLE NUMBER 650.

Now Blood in the A. Ph. A.

Almost anything may be "proven" by statistics. If it is desired to show that the American Pharmaceutical Association is a sturdy, vigorous, growing body it is necessary only to point to the fact that its increase in membership during the past decade has been nearly one hundred per cent. On the other hand, should anyone desire to establish a contention that it is a weak, puny thing with barely enough life to keep it going he could call statistics to his aid and say that although the association will enter upon its sixtieth year during the current twelvemonth, its membership roll shows the names of less than two-and-a-half thousand, out of many more than a hundred thousand eligibles.

No matter from which point of view its friends look upon the association, all must admit that there is room for its growth and development, and that such growth and development is desirable. Taking the pessimistic view for a while, just for the sake of argument, we may say that the patient is anemic—that it needs more blood. The way to introduce this blood is by adding members to the association as fast as it can assimilate them, and to add the members—ah, there's the rub! All sorts of means looking to this end have been tried, and prizes have been offered and won for papers setting forth the best reasons for pharmacists to identify themselves with the body. Efforts in the direction of increasing the membership have borne fruit, but not enough, and much of it has dropped off the tree before it was mature.

And now comes a man who, whether or not he is a doctor of pharmacy, may at least lay claim to the title we have conferred upon him of being a doctor of pharmacists, and says that the American Pharmaceutical Association is in bad shape. He undertakes to diagnose the trouble of the patient, and seemingly having done so to his own satisfaction, proceeds to offer an antitoxin for each toxin found in the sick body's cosmos—an antidote for each poison discovered. Even though there may be friends and advisers of the association who do not agree with this doctor, and so decline to administer his remedies, all must admit that he is a man of keen discernment and has shown much ingenuity in his analysis of the situation. This fact alone entitles his suggestions to a respectful hearing, and we feel certain that they will have at least that, and maybe more.

Speaking for ourselves we may say that while we agree with some things said in this doctor's report of a very interesting case, there are others in it with

which we are not in thorough accord. For instance, take what he says about the lack of recognition of young men by the association in the matter of offices. Let us do a little analyzing on our own account: Some of the officers of the association are elected in one way and some in another; the president, three vice-presidents, and three members of the council each year, are elected by ballots sent by mail. Each member of the association receives a ballot bearing the names of three nominees for each position to be filled, and the ballot is to be marked and returned by mail. No one but himself knows, not even the tellers, the names of the nominees for whom any member casts his vote. But who does the nominating? This is done by a committee made up of two members from each State—assuming that there are as many as two members from each State in attendance at the annual meeting—chosen by a caucus of all the members from that State in attendance. If only one member from a State is at the meeting, then he represents the State on the nominating committee; if no member is present from a State, then that State is not represented on the committee. Then the president appoints five members of the committee "at large." In the committee each member has an equal voice and vote. The so-called permanent officers of the association, that is to say the secretary, the treasurer, and the reporter on the progress of pharmacy, are elected by the council. The council, in turn, is composed of the officers of the association, nine members nominated and elected as has just been described (three each year, and no man eligible to succeed himself), the chairman of the various sections of the association, elected by popular vote of all the members present at the section meeting at the time of the election, and representatives of the various branches, chosen by the members of these branches. The editor of the *Bulletin* and the local secretary are ex-officio members of the council. All members of the council also have an equal voice and vote.

Usually the president of the association, as is fitting, is one of the older and more distinguished members; and the same may be said, with slight qualification, of the vice-presidents. The three members of the council elected each year usually are men who have shown particular zeal in, and knowledge of, the association's work, regardless of whether they are wholesalers, retailers, professors, manufacturers, or editors. Section officers are chosen on account of their supposed special qualification for the work which will devolve upon them, and frequently are young men and

new members; the same may be said of the members of the council chosen by the local branches.

To leave generalities and get down to a few instances, we may say that William L. Cliffe, of Philadelphia, was elected first vice-president of the association just four years after becoming a member; and Albert M. Roehrig, of Buffalo, was elected second vice-president when he had been a member only one year. Among those who have filled the office of third vice-president, Miss Josie Wanous, of Minneapolis, was elected after a membership extending over only one year; Henry Willis, of Quebec, when he was called upon to fill that office had been a member just five years; Otto F. Claus, of St. Louis, two years; and Oscar W. Bethea, of Meridian, Miss., five years. William C. Anderson, of Brooklyn, had been a member of the association only two years when he was elected secretary of its commercial section; Robert C. Reilly, of St. Louis, holds a similar record; Herman D. Knisely, of Checotah, Okla., was made secretary of this section the year he joined, and the chairman (and therefore a member of the council) the next year; Charles H. Avery, of Chicago, was elected secretary of the commercial section the year after he joined; George O. Young, of Buckhannon, W. Va., the same year he joined; Jacob Diner, of New York, was made its chairman after a year's membership; Eric H. Ladish, of Chicago, became the section's secretary three years after joining the association, and declined the office of chairman the next year, whereupon Waldo M. Bowman, of Toledo, who had joined the same year that Mr. Ladish did, was elected.

In the scientific section Charles E. Caspari, of St. Louis, was elected chairman just three years after joining the association; Reid Hunt, of Washington, was elected to the same office after two years' membership, and Albert H. Clark, of Chicago, became its secretary four years after joining the association, and its chairman the following year. A brief consideration of the records of the section on practical pharmacy and dispensing shows a few interesting facts: William Kaemmerer, a drug clerk, of Columbus, was elected secretary of the section two years after joining; William H. Burke, of Grand Rapids, Mich. (since deceased), was made secretary of the section the same year he joined, and its chairman the following year; William C. Kirchgessner, also of Grand Rapids, and also a drug clerk at the time, we believe, was made secretary of the section the next year after joining the association; H. A. B. Dunning, of Baltimore, another clerk, had been a member three years when he was elected secretary of the section, and four years when he became its chairman. Joseph Weinstein, of New York, was chosen as secretary after one year's membership, and was re-elected the next year; while Franklin M. Apple, of Philadelphia, had joined the association only two years prior to his election to the chairmanship of the section.

These are just a few figures, hurriedly compiled for use here from records made during the past ten or a dozen years; doubtless a careful review of the history of the association would discover as many more

equally striking ones. The young man who joins the American Pharmaceutical Association, attends its meetings, and demonstrates that he has ideas and energy, will soon receive all the recognition he could possibly have cause to expect. Incidentally, we may add that we believe a majority of the rank and file who attend the meetings do so because they wish to mingle with kindred spirits, and for the pleasure of seeing and hearing what is going on, and with no desire whatever to stand in the limelight.

With this we shall for the present leave the statement of the case as made by the diagnostician, without further attempt at adding to or detracting from its force, but will say in conclusion that the situation in the American Pharmaceutical Association at the present time is an interesting one, and likely to prove more so rather than the reverse as the months roll by. This very fact shows that new ideas have been injected and that new blood is at work. If the suggestions of our esteemed contributor, the "doctor of pharmacists," succeed in bringing still further new ideas—and more new blood—to the association, they will not have been offered in vain.

Clerks and Proprietors.

Very few druggists are now alive and in business who were proprietors of drug stores when the AMERICAN DRUGGISTS' CIRCULAR AND CHEMICAL GAZETTE was first issued over fifty-four years ago. Most of those who were in business in 1857 have been succeeded by their clerks, many of which latter have in turn been succeeded by *their* clerks. Probably a majority of the proprietors of drug stores in the United States to-day have been clerks at sometime within the past quarter of a century. If the CIRCULAR's attitude toward the clerks were not a friendly one, and if clerks were so unfriendly to the CIRCULAR that they could not be won over after they became proprietors, what should we do for subscribers? If there were no better reason for it than the instinct of self-preservation, the CIRCULAR would be friendly to the clerks. It expects to be in business twenty-five years from now, and to have as its chief supporters then the young men who are clerks to-day, together with many who will grow up to be clerks and, later, proprietors, during the intervening years. The interests of drug clerks and the interests of proprietors of drug stores are so nearly identical that a trained analyst, though in him are combined all the knowledge of the chemist, the skill of the microscopist, and the ability of the histologist, can not put his finger on a point and say that here those of the one cease and those of the other begin. There is no such point. We might go further and declare with but little if any exaggeration that there is no point covered by the interests of the proprietor which is not covered by the interest of the clerk, and vice versa.

Disregarding these facts or being unmindful of them, clerks now and then write to us in a complaining spirit and say that we do not give them as much attention as they deserve. In order to refute such a charge made a few years ago we went through our

files and picked out some of the things we had then recently printed from and for clerks, and so large a list did it make that we jokingly said that we hesitated to call attention to it for fear of arousing the jealousy or antagonism of the proprietors.

No one can read the CIRCULAR with any degree of care or regularity and not see that a great deal that it contains is intended to appeal, and doubtless does appeal, in an especial manner to the younger and less experienced men in the business, among whom, of course, the clerks form by far the larger part. Not only this, but much space is devoted to a discussion of the condition of employes, a large part of which is filled with communications from these employes. Of course we do not always agree with our drug-clerk friends who write us letters for publication, but this is only natural: we do not agree with all that the proprietors say in our correspondence columns. We are willing to give both sides of any question we discuss, however, and so print what proprietors and clerks have to say, and now and then point out something in their statements which is not in accordance with our understanding of the matter in hand, and give our reason for dissenting from the expressed view. For instance, in this issue is a letter from a clerk in which he complains that street railway employes receive better wages than drug clerks. The answer to this is obvious, and we make it: if you would rather be a street railway employe than a drug clerk there is nothing to prevent you from making the change. The drug clerk gets something in addition to his mere per diem that the street railway man does not receive. We do not intend by this answer to cut the clerk off short or to make him feel that he has not our good will. On the contrary, we like to hear from clerks and they most assuredly have our good will. We wish especially that more letters would come to us from cheerful clerks, such letters, for instance, as the one from Mr. Wray published last month. It is characteristic of man (and even the lower animals), however, that they are generally not spurred to take unusual action, to make a demonstration, except as an indication of trouble, pain, discontent or something else of a disagreeable nature. It is not the clerks with good positions, reasonable hours, adequate salaries, "easy bosses," good prospects of advancement, and all those things, that write most of the letters to the papers. A large part of the correspondence from clerks comes from those who have a real or fancied grievance to air. It does them good to air the grievance, it is well for proprietors to be reminded of it when there is cause for discontent among their clerks, and by discussion many of the ills of pharmacists may be obviated or eradicated. The better the position of clerks, the fewer clerks will want to become proprietors; while, on the other hand, the employer who treats his clerks as slaves will soon see them opening more stores in a neighborhood in which he doubtless thinks competition is quite keen enough already. As we have already said, the interests of the clerks and of the proprietors are almost identical; both are for pharmacy, and both are for improved business conditions. So are we.

The Ivory-Headed Public.

In their ability to resist the letting in of information concerning matters of health, the heads of a remarkably large portion of the general public seem to be made of solid ivory, bone or wood.

After all that has been said about the value of fresh air and exercise, and about the harmfulness of too much and improper eating and all "doping," and about the poisonousness of morphine-containing soothing syrup and acetanilide-laden headache remedies, what is the net result? We challenge any man to walk along the streets of the resident sections of his city late at night or early in the morning when the temperature is as low as sixty degrees, count the number of bed-room windows that he finds open and say that he needed more than his ten fingers to keep tabs on the count. See the people who, being neither tired nor pressed for time, start on a trip of half-a-dozen blocks, and board a street car with its beery, garlicky and cheesy air and no ventilation. Patronize the restaurants and hotel dining rooms and note how men stuff their stomachs as full as they will hold with all kinds of unmasticated food, making it go down with ice-water, coffee, beer or wine, instead of the natural digestive fluids of the mouth. The places patronized by the rich and presumably better-educated are not much if any better—maybe worse—in this respect than the cheaper grade of eating houses. The amount of coca and kola, cocaine and caffeine (or things which are intended to replace these), and other deleterious drugs consumed in the shape of soft drinks, by men, women and children in this country is simply appalling. Notwithstanding the vigorous campaign of education conducted by magazine writers, public officials, and some of the medical and pharmaceutical journals and daily newspapers, babies all over the land are daily drugged into insensibility through the administration of morphine in some thinly disguised form, by tired mothers and impatient nurses, just as they were before the campaign began, although, let us believe, less numerous. Occasionally the services of the coroner are necessitated by this method of quieting crying infants, but the lesson the inquest teaches seems soon to be lost upon the comparatively few whom it reaches. Let anyone who reads these lines have his wife or daughter or a woman acquaintance go into a company of her friends and complain of having a splitting headache, and see how quickly one or more of them will recommend the use of some acetanilide mixture—perhaps produce a powder or a cachet from her handbag or bureau drawer.

"Ah," says the maker of the headache remedy, or the narcotizing syrup, or the fountain "dope," "you are simply proving the innocuousness of our product, for if it were as harmful as you say, the public as a whole would have found it out." Has the public, as a whole, "found out" about the harmfulness of sleeping in closed rooms, about the suicidal effect of bolting unmasticated foods, about the value of open-air exercise and deep breathing, about scores of other things which have penetrated heads not composed

essentially of bone and something resembling scrambled eggs?

That man had the right idea who said that the public was like a herd of stampeding cattle prevented from going over a precipice by a few strong men who held a rope stretched near its brink. Let all druggists resolve to be rope holders in future.

IF ALL THIS INTERFERENCE WITH BUSINESS conditions goes on, what will become of us? Here we have officials condemning powdered drugs because they are loaded with pulverized nut shells, and there we see some inspector pouring cans of milk into the sewer simply because they contain an excess of perfectly wholesome water or even a little thing like a few drops of a solution of formaldehyde. We pick up the daily paper and find sandwiched between an account of a burglary and a report of political grafting, a dispatch to the effect that hundreds of thousands of boxes of sardines have been found unfit for food and condemned. Nobody's goods seem to be safe in these parlous times. Even the shoemakers are "catching it" for loading their leather with glucose so that it will make heavy and good-looking soles. Of course the glucose will dissolve as soon as it gets wet, but why should the maker worry about that? His goods sell better if they look all right, and he is in business to sell goods. But the disturbers of commercial interests are saying that there ought to be some way to compel him to make them of good leather; or, if he cannot afford that, then to let the poor leather he uses pass for what it is and not for something else. We turn over the paper and on the other side read that tons and tons of tomato paste used in making soup has been found to contain two thousand million-unhealthful bacteria—count 'em, two thousand million—to the teaspoonful, and was destroyed by United States marshals. Think of it; in this land of the free and home of the brave a minion of the law confiscating property worth large money and belonging to citizens who, because they have made enough to enable them to clothe and house themselves and families in fine style, are rated as highly respectable. The next item in the newspaper is headed "\$1,000,000 Sugar Fraud," and tells how the grand jury at New Orleans is directing its efforts and calling the attention of the vulgar public to some of the means by which their wealthy and high-toned neighbors are adding to their fortunes. If this kind of thing is not stopped soon there is no telling who will be safe. "But the ultimate consumer," someone says, "and the small dealer; how about them?" Oh, piffle; what good are these except to buy the products whose sale so helps to swell the dividends of the adulterators, misbranders, and other kinds of swindlers? The public be—excuse us; a little bit more and we should have written something that might still further have wounded the delicate sensibilities of those who are already much annoyed by things that are happening.

MEMORY OF PECULIARITIES of people is valuable to the salesman, just as memory of the names and faces is to those who would gain their favor. When a man went to Washington in the old days and approached Henry Clay with the salutation, "You don't know me, Senator, but I had the pleasure of hearing you speak at Jonesville six years ago and feel that I know you," that astute politician would at once recall the time he

spoke at Jonesville, inquire about some of its leading citizens by name, ask his caller in what part of the town he lived and maybe describe some of the houses on the street mentioned or ask whether his residence was on the hill beyond the branch [brook] or nearer the business center of the town. When that traveler got back to Jonesville he was a Henry Clay supporter, and when he told the leading citizens how the great man had asked about them, they, too, no matter what their politics, were sure to lean toward him more than before. Good memory is a valuable asset for a merchant as well as for a politician. The salesman who casually remarks to Mrs. Scads that a new lot of perfumery has just arrived, and unostentatiously shows her a bottle, remarking at the time that it is her favorite odor, is likely to make a good impression by the delicate flattery of remembering her taste. If he sells books or magazines it pleases his customers to have him say that "there is a new story out by So-and-So, whose style you seem to like." Discriminating young women soon acquire a preference for a certain brand of cold cream or a special variety of candy, and soda-water drinkers are likely to call for the same drink repeatedly. When waiting on customers with established preferences it pays the clerk to be able to ask, "The same?" and produce the desired article without waiting for detailed descriptions. There is a large amount of psychology in salesmanship, and the better this fact is understood by the salesman and the more adept he is in its practice, the more successful he is sure to be. Memory for peculiarities is a strong lever for the salesman who wants to be psychologist.

COMPARING A SICK MAN TO A YARD in which a lot of he cats are making discordant noises (possibly with that portion of their interior economy destined to serve as strings for a bass viol), requires a considerable stretch of the imagination, but the imagination having once been so stretched as to make the comparison, an analogy may be established in a number of ways. For instance, in the yard o' cats there is a disturbance, as there is in the sick man. In this manifestation—either one—the neighbors take an interest. They go further: they offer remedies for its abatement. One sets his mind to wishing for a surcease of the disturbance, and maybe it surceases—or doesn't. Another throws small spitballs into the yard or sugar pellets into the man, with results as noted under the preceding head. A more vigorous-minded citizen hurls spoiled potatoes, brickbats, old bottles, or whatever else comes handy, into the yard, or grandmother remedies, horse boluses, headache wafers, "patent" medicines and the like unto the corpus of the human sufferer, the result in each case being that the arena of action is littered up and put into a dangerous condition, and made unfit for ordinary use, while the disturbance merely stops long enough to shift from one corner of the scene to another and then breaks forth again with renewed violence. The real remedy is to refer the case to the legally constituted authorities who have made a study of similar ones and are prepared to treat them scientifically—who are licensed either to kill the cause of the trouble or to enter upon the premises and remove this cause by more or less gentle means.

DISPENSING BY PHYSICIANS is a matter which is attracting more and more attention from pharmacists, and a very good pharmaceutical friend of ours in a personal letter to us on another subject has taken oc-

casion to say that he does not agree with what we have said on the subject. We are open to conviction, and if we ever see any feasible way in addition to the one we have suggested, to cause physicians to write prescriptions for pharmacists to fill, instead of dispensing the indicated remedy themselves, we shall most assuredly advocate that way. A good prescription trade is the most profitable thing about a drug store, and if such a thing were practicable, we should be glad to have pharmacists dispense all medicines used. But we do not expect to see, and in our present frame of mind can not conscientiously advocate, such a seeming absurdity as a law prohibiting the physician from administering to his patient any medicine which in his opinion the patient needs, and administering it when and where and how his judgment dictates. If it were possible to put such a law on the books and a reputable physician were arrested for disregarding it, his simple statement that he had acted in the interest of suffering humanity would doubtless be enough to secure his discharge by any court. In case of sickness the judgment of the physician is one from which there is no appeal; and the fact that the medical profession harbors some ignorant and vicious men does not change this condition, and should not; and we may well leave it to the medical profession to do what it can to rid itself of its own "undesirables." In the meantime, physicians are writing many prescriptions, and these, naturally, they prefer should be filled by those men who have demonstrated their ability to fill them in the best style of the art pharmaceutic, and their willingness to leave the treatment of the sick to those who are prepared to undertake it.

TELEPHONING PRESCRIPTIONS is a modern practice, one which has come into vogue within the experience of comparatively young men; but already its displacement by something more in keeping with twentieth-century progress is threatened. The press dispatches a few weeks ago contained an account of a sea captain who was taken sick while on the deep, with no doctor aboard. He sent a home-made diagnosis of his trouble by wireless, and a ship's surgeon nearly a thousand miles away caught the message and "wirelessed" back a prescription and direction for treatment. The necessary medicines were aboard the sick captain's vessel, and, according to the story, he was soon himself again.

DRUGGISTS MAY SUPPLY MORPHINE and other habit-forming drugs to habitués, and unquestionably many of them do, but we have yet to hear of an instance of a druggist urging or enforcing the use of such things upon anyone: this is done by the peripatetic venders of the "red-light" and "tenderloin" districts on the one hand, and by practicing physicians on the other. Dr. H. W. Wiley, of Washington, has recently given utterance to a few remarks on this phase of a subject that is much-discussed just now, which remarks are quoted in our news columns this month.

TO HELP THE GET-TOGETHER MOVEMENT on the part of boards of pharmacy and State pharmaceutical associations, a uniform size for the annual reports and proceedings of these bodies would be a step in the right direction. Most of them are nearly uniform in size now, and it would work no hardship on anybody to make all of them quite so.

The True Story of a Make-Believe Editor.

An editor once fell sick, as even editors are human—sometimes—and subject to human ills. But that was no excuse for the paper not to come out, so it continued to appear. A man who was busy at another job collected material to go into the paper. Being busy at this other job, the "relief" editor did not have time to write original articles, but still he knew that his readers expected something of this kind. So what did he do? Guess. Did he buy original articles of those who had them to sell? He did not. Did he hire somebody to write them for him? Guess again. Well, what *did* he do? Sh-h-h—he clipped them from other papers. Now what do you think of that!

But that isn't all. The editor of one of the papers from which clippings were made and printed without credit wrote to the make-believe editor and asked him what he meant. And for once the editor did not say it was the printer's fault for leaving the credit line off and would not happen again, but he actually told just what we have here repeated, and stated that he did not propose to stop. He said that he simply had to do it. You see he was not a real editor but only a make-believe. All of which happened—so there!"

Eyestrain.

Stephenson (*The Lancet*) says that whenever a headache, migraine, vertigo, or "tic" is induced or made worse by use of the eyes and relieved by rest, one may safely assume it is due to eyestrain. Slight errors of refraction are most likely to cause distress in persons who have inherited or acquired an unstable nervous system. Headache is the commonest reflex manifestation of eyestrain. Of all errors of refraction, slight grades of hyperopia, and particularly of hyperopic astigmatism, are those most likely to cause distress. A large error of refraction, leads, as a rule, to defective sight and not to eyestrain. Among the symptoms or conditions that may result from eyestrain, the author mentions, besides headache, insomnia, migraine, vertigo, functional neuroses, such as habit-spasm, and polyuria, epilepsy, and phobias. Many other conditions have been assigned to the same cause, although not always upon adequate evidence.

A Disguise for Copaiba.

A correspondent of the *Pharmaceutical Journal* says that compound tincture of benzoin almost completely masks the taste and smell of copaiba in the ordinary alkaline mixtures. He avers that he could not detect the presence of the balsam in a mixture containing 3 drams of copaiba and 2 drams of the tincture in 8 ounces.

The true salesman knows and understands his merchandise, whatever the kind. The first-class salesman should be able to answer all ordinary questions of the customer as to quality, place of growth or manufacture, etc. A good drug salesman should be able to point out the good qualities of the various kinds of merchandise that make up the drug stock of to-day.—C. S. Davis, before the Tennessee Pharmaceutical Association.

The law represents that modicum of morality which can be squeezed out of the ruck of mankind; but what is that to me, who aim higher and seek to be my own more stringent judge?—R. L. Stevenson.

The Sick A. Ph. A.—Diagnosis and Treatment.

By a DOCTOR OF PHARMACISTS.

It is only the exceptional man who is willing to work for the good of others unless a good slice of benefit comes home to the worker. It must come to him, too, in palpable form and not as an ideal. I hardly think more than one per cent. of philanthropists, so-called, would keep up their philanthropy for a week if no pleasant returns came to them. This is rule number one.

Human nature is so constructed that some love applause as much as or more than money, while others seek applause because it brings money. If it brings position, business, etc., that is the same as bringing money. A very few love knowledge and will accept that as the equivalent of money. A fair number of pharmacists are well enough off to afford an occasional outing. When they can get that outing at reduced rates, at a time that is convenient to them, and with agreeable people whom they like to meet, that is money to them. This is rule number two.

If any society is to thrive it must supply the conditions of rule number two to a large proportion of the people it seeks to get as members, and if it is to grow it must adopt some method of proving to the people it is interested in that it can and will bring them that which they want. It must advertise its wares among prospective customers and prove itself to be a genuine, simon pure bargain store. This is rule number three.

If a pharmaceutical society seeks to emulate the American Medical Association it must become a means of providing honors and emoluments to its members of as substantial a character as the latter does. The American Medical Association advertises its specialists, supplies honors to its little men, and brings knowledge that no physician can afford to try to do without. It gives them a free weekly journal. This we may call rule number four, but it is in fact part of rule number two.

As pharmacists average no better than other men their society must appeal to their minds as something that will pay and pay substantially. Now what classes of pharmacists does it pay in the manner here indicated? It pays college professors because it advertises their colleges. It pays manufacturers of specialties because it enables them to advertise their wares. It pays pharmaceutical journals because it keeps other journals from getting an advantage over them; their gain is chiefly in preventing disaster to their interests by too active rivals. It pays men who love applause when they happen to be chosen to office. It pays students who are seeking new knowledge, but they are almost a negligible quantity. It pays a few well-to-do pharmacists who can afford an annual outing and who are, through the association, able to get it at a reduced rate. It pays members of boards of pharmacy who are ambitious to be well known and thought well of as workers in the interests of pharmacy.

What classes of pharmacists does it not pay? I might reply to this in a word by including in this category all the rest of the pharmacists of the country. In other words it offers nothing to the rank and file of pharmacists, throughout the country, that can at all tempt them to join. The proof of this is

found in the fact that they do not join and have persistently refused to join for over half a century, and that too in defiance of every inducement that has yet been devised to tempt them to join. They simply remain unconvinced that the association is of any earthly advantage to them. The stay-at-home pharmacists will have nothing to do with it. The rich pharmacists, who prefer touring abroad, are not tempted by it. The poor pharmacists, who have to work and slave all the year round in their dingy stores, have not the time or the money to attend its meetings.

How can it be made to pay more pharmacists than it now does and so tempt an increase in membership? There are a number of ways by which this could be accomplished, but I am afraid those already members are not altruistic enough to make the needed changes. Like every other body, the American Pharmaceutical Association has been going along in the line of least resistance. It is just such a body as its present members are capable of making it. The belling of the cat by the mice was a no more difficult task than the changing of the structure of the American Pharmaceutical Association would be unless some strong, young, and truly unselfish man is willing to take up the task in a diplomatic manner and bring it about by degrees and with the help of the few older men who can see far enough to want the only kind of change that will ever bring in any great increase in membership.

The most important reformation required in the American Pharmaceutical Association is that it shall turn the old fellows out of every office. It should let the tree have freedom to grow. It should make way for the ambitious young. Germ cells are needed at the important points of its development. It should stimulate ambition among young pharmacists by putting every new member who is young immediately into office. But here care must be taken to keep out of office every man whose business interests alone will carry him to the meetings. What is the sense of giving one, two or three positions of honor to a pharmaceutical editor who would be there anyway, and keeping the same from one, two or three lay pharmacists who could be tempted to attend and remain with the society by having an office for a while? Why fill the tempting offices with college professors who would attend without such a temptation, when by so doing we are taking away from the association a means of acquiring members? The pharmacists of the country have come to find out that it would be useless for them to join the association for the sake of honor, as it so seldom comes their way. Occasionally, as a sort of accident, or as a sop, an office is thrown at them. They all know that it is not the order of things for this to occur. Why give offices to the representatives of manufacturing houses who are paid by their employers to be there anyway or who know that attendance there adds permanence to their job? Why not give all offices to retail pharmacists and to no one else? The professors and others, under such a rule, would struggle the harder to get a chance to produce and read interesting papers that would help them in their self advertising. They are now converted into drones, when under a different plan they would be working bees.

The meetings of the association should be held not at expensive resorts, but first in one State and then in another, and so call in the local pharmacists of every

State in the Union. It should go to the State at the time that the State association meets, and at no other time. In this way it would lessen the expense upon the members of the State associations, who instead of having to pay two railway fares and two hotel bills would get off with the payment of only one. Many of them would remain no longer for the one meeting than they would for the two, as their limited means would compel an early return home, but they would all manage to spend a part of their time at each. The double attraction would bring out a much larger attendance at the State meeting. Everybody would get more for his money and every meeting would add a host of new members. At these meetings the publication of the names of the members of the American Pharmaceutical Association who live in the State in which the meeting is held should form a part of the regular association advertising. Many men love to see their names in their local papers, and this sop to vanity would give them just so much more for their money of the very goods they desire. Besides, such publication could be so used as to be of real business value to the members; to let the public know who are the pharmacists who stand for high merit in pharmacy is to advertise the members of the association to their benefit, and such advertising would act as a stimulus to non-members to join.

The American Pharmaceutical Association should assume the function of educating the public to an appreciation of high-grade pharmacy. It should use the local press of the regions it is about to visit in telling some of the things that the association is trying to do for the public. It should show the kinds of men who are backing the association. It should teach the public the advantages of the Pharmacopœia to them and their ailing. It should let the doctors of every region know what pharmacists in their region have subscribed to the ethics of the association and should tell these doctors what these ethics are. It should ask the co-operation of the doctors in getting the pharmacists they patronize to become members of the same, and thus help along their own cause as practitioners. It should tell the doctors some of the things that the association has done for them in the past and some of the things it seeks to do for them in the future. In this way pressure would be brought upon pharmacists everywhere to join as a matter of self interest. The pharmacists should all, likewise, be appealed to to join. They should be shown how their names will appear before the public as high-grade pharmacists. They should be shown that they will be advertised in the same way among the doctors. They should be taught that by keeping out of the association they are advertising themselves to doctors and public as being men who are non-progressive and who cannot possibly give the best service as they do not know the latest and best in pharmacy.

To sum up: Until the American Pharmaceutical Association ceases to cater to the selfish interests of a few and goes in for catering to the selfish interests of the many it cannot hope to grow.

Mix well and sift.	

Confidences.

By THE LUBRICATOR.*

I have been requested by the editor of the CIRCULAR to contribute to its pages a "humorous story."

This introduction will be better appreciated when I explain that I am a retail druggist actively engaged in conducting a moderately busy store, with post-office sub-station attachment, assisted by one boy and a negro porter. And not only that, but during the preceding twelve months this joke-smith has had the following incidents trip blithely by close upon one another's heels:

1. The bank wherein lay his trust, together with nearly a thousand dollars of his savings, closed its doors, with no assets.

2. Demand notes for \$1,200 fell due a few days thereafter.

3. When he began to perk up a bit, double pneumonia got a strangle hold on him and the force which ran the store during his seven weeks' absence succeeded with great ingenuity in cutting the daily sales in half.

4. And then he got a brand new clerk, warm from college. This young man had ideas, also prejudices. He set out to teach the poorer customers from the humbler walks of life their proper place; and among other bewildering things, refused to refill prescriptions for cocoa flavored mixtures on account of the cocaine (!) they contained.

Otherwise the writer enjoyed the past year hugely, is glad he is here, and believes the light on the horizon to be the rosy dawn of things pharmaceutical and not the angry red glare of sunset, as it is now the fashion to claim.

Awhile back, the writer, in a modest way, took the world into his confidence and laid the result of his first year's business open to public gaze. And the

*Once upon a time a certain former drug clerk who had gone into business for himself wrote an article which he entitled "A Touch of Lubricant for the Hinges of the Drug Clerk's 'Door of Hope.'" This was published in the CIRCULAR for March, 1909, page 116, and at once created a storm of protest from proprietors who did not want their clerks to go into business in opposition to them. The author of the contribution was read into the "Ananias Club" by several correspondents, and the CIRCULAR was roundly abused for printing false statements which would lure poorly informed young pharmacists to their ruin. Some correspondents were sarcastic, some were sorrowful, some treated the matter as a rather grim joke, and all, or nearly all, seemed to regard as a fabrication the statement of the former clerk that he began business on a capital of \$42 in cash and a plentiful supply of "nerve," and cleared about \$5,000 the first year. Some of the letters evoked, or provoked, by the original publication, appear in the issue of the CIRCULAR for May, page 245; June, page 300; July, page 353; August, page 415; and October, page 530, all for 1909. One journal, even after we had personally vouched for the truthfulness of the author of the communication, had such a poor opinion of us that it charged that the former drug clerk was simply a product of our imagination, and this, notwithstanding the fact that it regards much of our work good enough to "lift" and pass off as its own; a thief trusts few people. But that is another story. We started out to say that "The Lubricator," as he was called, has been heard from again, and here is presented what he says. We repeat what we said a couple of years ago, that the man under discussion was a most unusual clerk, and is a most unusual proprietor. Perhaps not one clerk in a thousand served his employer as well as he did, and probably not one clerk in a thousand would make the success in business for himself that he has made.—Editor THE DRUGGISTS CIRCULAR.

world generally and separately called him a liar. But he wasn't.

Right now there would be another statement, and it would agree very favorably with the first, but for the reasons that have already been enumerated. Suffice it to say, that all current indebtedness has been met, stock in trade materially increased, and outstanding notes have been curtailed over \$1,200.

But it's a windy job, blowing one's own horn.

The drug man, taken as a whole, is a rather decent sort of chap. He enjoys the confidence and respect of his community, and though his gains are not tremendous, he usually makes a decent living for himself and family. And what more is there?

Drug Reform and the A. Ph. A.*

The committee on drug reform of the American Pharmaceutical Association desires to call attention to the circular herewith presented dealing with various phases of needed drug reform. The present committee is a continuation of last year's committee, and is similarly constituted; hence it is scarcely necessary to reiterate that as its function is not executive and scarcely even advisory, it considers that its task may be best accomplished by bringing before the public the results of investigations and indicating possible reforms.

During the last year circulars were issued to the members of the profession, soliciting co-operation, suggestions in regard to the work, and criticism. As the committee now desires to issue another circular preparatory to the work of the present year, it deems it advisable to here emphasize the salient points of the former circulars, and include such additional information and further suggestions as may be offered at this time.

There is need of progress in drug reform in both of two directions; that of better administration of existing federal and State laws, and that of new legislation aimed at abuses not covered by existing statutes. Attention is again called to the fact that the various pure food and drugs acts will not administer themselves. While they have accomplished much good merely by directing public attention to the enormous use of adulterants, they will fail of their true purpose unless the reforms embodied in them can be carried out. Weaknesses of federal administration are in part the result of a division of the responsibilities for the same between two executive departments, and in part the result of insufficiency of appropriations for carrying on the work. It is strongly urged that every effort shall be made to correct this deficiency at once. Former President Rusby, of our association, has repeatedly called attention to the fact that adulterated drugs may be landed at certain United States ports without inspection. This is not due to any fault of federal law, but solely to lack of proper provision for its administration. This is now pretty well corrected.

The causes of weakness in the various State administrations differ widely in the different States. The result of placing such reform in the hands of a department whose purpose is quite foreign, is well shown in the case of North Carolina, where the department of agriculture has done much for the farmers, but little toward securing pure food and drugs. In general, since the federal administration does not reach intrastate commerce, or the manufacture of articles intended for such commerce, the State officials having the work in charge should give more attention to these abuses. That they constitute a vast, profit-

able, and shameless industry, is apparent to anyone connected with the administration of the law. It is very clear that any State whose administration is weak in such respects will surely be the dumping ground for sub-standard materials.

Moreover, there is a great need for more uniform State legislation. As pointed out in a former report, twenty-nine of the States have already passed food and drugs acts closely modeled upon the federal law. Although the committee feels that to draft a model uniform drug law would encroach upon the duties of the committee on national and State legislation, it urges that this be done.

Better administration in both State and nation may also be secured by co-ordination of the boards organized for such purpose. The need is well shown in Dr. Kebler's experience with the Hoboken drug house. If in this case State authorities had been working with federal authorities the offenders would have been promptly brought to justice. The American Pharmaceutical Association should take steps to secure a complete report on the present status of drug legislation and administration, with a view to securing, as far as possible, a better correlation of the forces of administration.

A number of needed reforms fall within the scope of possible legislation. The first of these would require federal enactment. There are certain materials imported primarily for purposes of adulteration, such as ground olive pits and cocoanut shells. Possibly legislation requiring a statement by the importer of the use to which such articles are to be put would lessen or eliminate such importations.

A second needed reform is the restriction and registration of the sale of poisons in various forms by agricultural, hardware, and industrial supply houses. At present large quantities of such substances are sold by untrained dealers for use as disinfectants, insecticides, and industrial agents, without any sort of registration whatever. The Pennsylvania Pharmaceutical Association has prepared a bill to meet this evil.

The need of a better standardization of drugs will doubtless be met in part by the revision of the United States Pharmacopœia now in progress. The committee is facing a number of problems which relate to evasions of the law. One of these relates not so much to the question of the identification of the pure drug, as to that of the detection and identification of all probable adulterants. A proof of adulteration should be established if the drug does not respond to the test of the genuine authentic material. We have in the United States Pharmacopœia what we may term positive tests, which relate to the identification of authentic material. We have also tests that may be characterized as negative tests, showing the presence of that which is not the genuine material. It is our opinion that the positive test should be considered as most conclusive and serviceable, rather than the negative, because if the Pharmacopœia should fail to identify certain possible adulterants, the positive test (the one identifying the pure material), should be sufficient for all practical purposes for the administration of the law.

Merchants are facing the problem of sub-standard material which finds its way into the market. The pepsin test case in Pennsylvania offers an illustration of this condition. The pure food and drugs act drawn by a committee of the State board of health in Maryland would keep all sub-standard goods from being placed on the market unless designated as not for medicine, on the ground that admission of sub-standard materials as medicine emasculates the law. There is no valid reason for a toleration of several standards.

Every agency which can be made to render service in the interest of judicious reform in these matters should be enlisted for that purpose. As suggested in the report, the American Pharmaceutical Association can aid materially by creating a separate division of the scientific section, consisting of all who are interested in drug analysis, to meet on a special day for comparison and discussion. This division would constitute a sort of clearing house for drug analysts and inspectors, who could thus at this time pool their experiences.

While the committee is not regardless of the resolution passed by the American Pharmaceutical Association at its Richmond meeting regarding the dispensing physicians, it does not consider that any report on drug reform would be complete without some mention of the conditions of this branch of the drug traffic. Dispensing doctors are becom-

*This is an open letter to the pharmacists of the United States from the committee on drug reform of the American Pharmaceutical Association, composed of L. E. Sayre, of Lawrence, Kan., chairman; Albert Schneider, of San Francisco, Cal.; and E. V. Howell, of Chapel Hill, N. C.—Editor THE DRUGGISTS CIRCULAR.

ing more numerous, particularly in some portions of the West. The time that the physician in preparation for his calling devotes to an especial study of drugs is limited, amounting in many cases to not more than three or four weeks in toto. The pharmacist spends ten to twenty times as long. Consequently, the physician is not often so well informed on this subject as the pharmacist; in addition, he is generally too busy a man to make a proper examination of the drugs he dispenses. These conditions make him an easy prey for pharmaceutical supply houses seeking to unload adulterated or inferior goods where they will not be subject to inspection. In addition, the dispensing physician is obliged by custom to make no charge, or but slight charge, for his medicine; consequently, he can seldom afford to keep a large stock of drugs on hand, and such as he has are apt to be of an inferior quality. The result is that the patient frequently may be given an adulterated or inferior article, or a substitute for the correct remedy or a smaller quantity than he requires of that which he should have. In addition, these drugs are generally kept and handled in tablet form, making it impossible to vary the dose to suit individual requirements. These are recognized evils attending the custom when the physician is honest and upright; if he chance to be otherwise, we have, in view of the fact that the physician himself prepares the death certificate, all the material for a Swope tragedy. These conditions can be remedied only by legislation bringing the wares of the dispensing physician within the scope of legal inspection, and obliging the physician himself to give proof of pharmaceutical ability. Pharmacists will give all possible encouragement to any step taken in such a direction by the American Medical Association. Honest and competent dispensing physicians will be both willing to demonstrate their competency before boards of pharmacy and to submit their drugs to legal inspection, and glad to lend their aid in any movement tending to establish such legal requirements whether it emanates from the medical or the pharmaceutical body.

It is to be hoped that the foregoing circular will enlist all the members of the American Pharmaceutical Association as well as others who are interested in its work. It is also the desire of the committee that the points considered will be freely criticised. Those who will interest themselves in the work of the committee are expected to send to members of the committee practical suggestions on the lines of drug reform, and thus aid the committee in whatever way they may see proper. It is to be understood that this circular is intended to be suggestive, merely looking forward to a campaign for progressive reform.

Caffeine Beverages Worse than Coffee.

In speaking at a congressional hearing on bills to restrict the interstate traffic in opium and other habit-forming drugs, Dr. William Jay Schieffelin, of New York, president of the National Wholesale Druggists' Association, said:

"Caffeine is the alkaloid in tea or coffee. But when you take it in tea and coffee you take it accompanied by caffe-tannic acid, which goes in with the infusion. After you have had two or three cups your stomach does not crave any more. If you extract the caffeine and mix it with syrup and flavor it like sarsaparilla, say, you can drink six or eight glasses of it, and there is no warning from your stomach, and you are a nervous wreck. That is the danger of the drinks which have had caffeine added to them."

Troches for Hoarseness.

Elm bark in fine powder..... 1 ounce.
Powdered sugar..... 4 ounces.
Oil of anise..... to flavor.

Mix; form a mass with a little tragacanth paste; and make into troches.

A Prayer for Newspaper Men and Writers.*

By WALTER RAUSCHENBUSCH.

O thou great source of truth and knowledge, we remember before thee the writers of books, the newspaper men, and all whose calling it is to gather and winnow facts and to inform the people. Grant them a determined love for honest work and a staunch hatred for the making of lies, lest they pervert the judgments of our nation and teach us to call light darkness and darkness light. Suffer them not to drug the mind of our people with falsehood and prejudice. Since the sanity and wisdom of a nation are in their charge, may they count it shame to set the baser passion of men on fire for the sake of gain.

Grant them boldness to turn the unwelcome light on those who love the darkness because their deeds are evil. Put into their hands the shining sword of truth, and make them worthy sons of the champions of the people in the past who held truth to be a holy thing for which men should die. Make them realize that they have a public function in the commonwealth, and that their country may be saved by their courage and undone by their cowardice and silence.

Grant them the heart of manhood to cast their mighty influence with the forces which make the people strong and free, and if they suffer loss, may they rejoice in that as proof to their own souls that they too have been friends of the common man and servants of the higher law.

"Headache Cures" and the Druggist.

The Northern Ohio Druggists' Association, with headquarters at Cleveland, issues a little leaflet called *Association News*, in the January issue of which the following sensible advice is given to its members and retail druggists generally:

Does it occur to some of our friends who complain of the falling off of their prescription trade, that the lack of medical patronage is largely due to their own fault? This thought is suggested by glances at the display in the windows of many drug stores. It seems as if some druggists consider their show windows as a lumber room in which anybody who comes along can show his window display. Take, for instance, the acetanilide headache "cures." If there is one commodity that the American Medical Association has dinned into the ears of its members as the most dangerous of "patents," it is these self-same acetanilide mixtures, and yet our store windows are fairly yellow with these displays and at the same time naively post on the signs "prescriptions a specialty."

Equally, though less ethically surprising are the displays of articles which any alert pharmacist knows are being widely advertised at ruinous prices.

Yea, verily! the show window is a sadly abused servant! Apropos of the A. M. A. crusade against acetanilide mixtures, every druggist should read the pamphlet gotten out by that influential body entitled, *Propaganda for Reform in Proprietarys*. The pamphlet fairly teems with virility and should be known both by the druggist who loves pharmacy and by the one who considers his calling simply as a business proposition. In fact, it is of more importance to the commercial druggist than it is to the prescriptionist. The secretary has some copies of the pamphlet for those who would like to see it.

To preserve new tinware, says George W. Hague, in *Meyer Brothers Druggist*, rub it with benzoated lard and heat it well before using it. This treatment, he claims, will prevent the tin from rusting, even when it has been put away damp.

*From the *American Magazine*.

Rhizome and Roots of Phlox Carolina.*

BY PROF. HENRY KRAEMER.

For some time I have felt the importance of making studies of the structure of the underground portions of American plants, as there are so many vegetable fragments of unknown origin in many cases which are found admixed with the more common drugs, and which have a superficial resemblance to them. Thus, unless careful garbling is practiced, these foreign plant parts may not only be found as an admixture, but as an entire substitute for the genuine drug.

My interest in phlox carolina dates back some twelve years when, at my request, Mr. C. D. Beadle, of the Biltmore Herbarium, sent me a number of plants which he collected in the mountains of North Carolina. While I did not make an extended study of the material at the time, I examined it sufficiently to lead to the conclusion that the material which Greenish described in his paper did not answer to the description of phlox carolina.† My main object at that time was to determine the origin of a substitute for spigelia, in which one of my students at Northwestern University discovered by accident the presence of calcium carbonate. This substitute was shown subsequently and independently by Stockberger‡ and Holm§ to be the rhizome of ruellia ciliosa.

In connection with their studies on spigelia marilandica and ruellia ciliosa, these authors have also described the structure of phlox ovata (phlox carolina). While the papers of Stockberger and Holm are excellent contributions to the subject, there are still some features which should be brought out more distinctly, especially from the practical pharmacognostic point of view. Stockberger considers that the rhizome and roots of phlox ovata "rarely or never occur as a substitute for spigelia," and I agree with him in a measure, but its occurrence is still reported and, besides, workers do not seem to be clear in regard to the characters of the drug. I do not, however, agree with the statement made by Stockberger that "the root so generally described and studied as phlox must be referred to ruellia," which latter drug I hope to take up later.

In order that errors may be eliminated from the literature, it should be pointed out that in the English translation of Solereder's Systematic Anatomy of the Dicotyledons, which appeared as recently as 1908, the translators continue the mistake in the original German edition of accepting as true the description given by Greenish** of what he had reason to suppose was phlox carolina, but which it has since been seen was not an authentic specimen. It should also be pointed out for the benefit of practical workers that the material studied by Prof. Greenish was drug material some of which was supplied by Prof. Maisch, but neither of them is open to criticism, both of them having accepted as probably genuine what was supplied them, as was then more customary. Indeed, Prof. Greenish did a very excellent piece of work, and nothing would have been left to be desired if he had

known the name of the plant from which the material with which he worked was derived and had named his paper accordingly, that is, by substituting the name ruellia ciliosa for phlox carolina. Later experience also shows that it is extremely hazardous to base a study of a vegetable drug on the commercial material alone, and that no studies of this kind can be considered entirely reliable or authoritative which are not based upon material collected from or compared with that derived from plants which have been identified.

The species belonging to the genus phlox are found chiefly in North America, where they number about thirty. The plants are mostly herbaceous perennials, a number of the species being extensively cultivated for ornamental purposes. The stems are either decumbent or ascending, or in some cases they are slightly decumbent near the base and then ascending, as in phlox ovata. Phlox ovata is found in open mountainous woods from Alabama to Pennsylvania, and there are some colored plates representing this plant in the *Botanical Magazine* (t. 528 and 1344). According to Gray, in his *Flora of North America*, phlox carolina is merely a taller form of phlox ovata, but having narrower, more tapering leaves and pointed calyx teeth, approaching phlox glaberrima. According to botanists to-day, the form with ovate or ovate-lanceolate leaves is regarded as the typical species, and the name phlox carolina has been superseded by phlox ovata.

Phlox ovata generally attains a height of from 3 to 6 decimeters. The stems are cylindrical, smooth, and the diameter is from $2\frac{1}{2}$ to $3\frac{1}{2}$ mm. Thus, they are seen to be slender stems, and in order to maintain their perpendicular position would need to be quite woody, especially in the lower portion, which they are. The so-called rhizome, which is merely an extension of the over-ground stem, is usually vertical, comprising from two to four nodes, and usually 1 to 2 cm. long. From the nodes arise from two to four comparatively thick roots, which are sometimes nearly 2 mm. in diameter in the fresh state, from 1 to 2 decimeters long, unbranched and produce a large number of fine rootlets, especially near the free ends (figure A). The commonly vertical character of the rhizome of phlox ovata is one of the features which distinguishes it from the rhizomes of both spigelia and ruellia, although it should be stated that occasionally decumbent stems are found which produce roots at the nodes. In neither case is that part of the stem producing roots a true rhizome.

The rhizome, or underground part of the stem, is characterized by a strong development of woody tissue, which in transverse section occupies about one-half of the radius. The bark is about 0.5 mm. in diameter, the xylem and phloem together are about 0.9 mm. in diameter, and the radius of the pith is 0.3 mm.

Histological Characters of Rhizome.—The epidermis in transverse section is made up of rounded tabular cells and is surrounded by a cuticle which is more or less lignified and 8 to 10 microns in thickness. Beneath the epidermis are two to four rows of collenchymatous cells, the remainder of the cortex being made up of about twelve rows of parenchyma cells, the walls of which are about 5 microns thick, the cells themselves being from 40 to 80 microns in diameter. All of the cells of the cortex are rich in protoplasmic contents, and sometimes contain a considerable number of small starch grains, 1 to 3 microns

*Read at the 1910 meeting of the American Pharmaceutical Association.

***Pharmaceutical Journal and Transaction*, 21, page 839 (1891); *American Journal of Pharmacy*, 63, page 226.

in diameter, Beneath the cells of the cortex there is usually a well-defined ring of endodermal cells, which may be more or less lignified, and which may also contain a few small starch grains. Beneath the endodermis is a layer of pericambial cells, which show one or two tangential divisions. Next beneath is the sieve, which is made up either of thin-walled, somewhat

tabular cells, or of oval, very thick-walled cells. The sieve cells are rich in protoplasmic contents, and frequently contain a number of starch grains. The xylem portion of the fibrovascular bundles (figure C) is made up, of at least two, and frequently three areas—an outer layer composed of compact, strongly lignified stems but not here illustrated; a middle layer, as in figure C, in which there are radial rows of parenchyma cells separating the thick-walled lignified cells; and a continuous zone of lignified cells, as in figure C. The tracheæ are marked with bordered pores, and those near the center of the rhizome have annular and spiral markings, the number of tracheæ thus marked being rather striking and characteristic. Most of the lignified cells of the xylem are in the nature of

tracheids, which are narrower and longer than those in spigelia, being usually not more than 20 microns in diameter and about 500 microns long (figure F). The parenchyma cells in the outer layers of the wood not infrequently show the presence of a number of small starch grains similar to those already described. Underlying the xylem tissue, somewhat tabular cells, resembling those of the sieve, sometimes occur, but

for the most part all of the cells beneath the xylem constituting the pith, are made up of somewhat thick-walled parenchyma cells resembling those of the cortex. The walls of these cells are non-lignified, and are wanting in simple pores. The cells are rich in protoplasmic contents, and may contain a large number of starch grains.

The most characteristic features of the rhizome of

phlox ovata may be enumerated as follows: (1) The upright or vertical position of the rhizome; (2) the few rather long and comparatively thick roots extending from the nodes; (3) the comparatively thick xylem; (4) the absence of an internal phloem, the fibrovascular bundles being of the collateral type, and (5) the presence of starch in at least the rhizomes of the fruiting plants. The fact that neither Stockberger nor Holm found starch in this rhizome is probably due to their having worked with material in which it was present in rather small quantities, the amount varying unquestionably with the season of the year. I especially mention this point, in view of the fact that Stockberger places phlox in a group in which starch is wanting, and calls attention to its supposed absence as a differ-

Phlox Ovata L. (Phlox Carolina L.)

A, lower portion of plant showing long roots with numerous rootlets at the ends; B, parenchyma from cortex of rhizome showing two sclerotic cells (s); C, cross-section of portion of rhizome showing parenchyma of cortex (p) which contains protoplasm and starch grains, endodermis (e), leptome (s), tracheæ (v), libriform (t), wood parenchyma (w), parenchyma of pith containing starch grains and protoplasm (pa); D, isolated sclerotic cells from cortex; E, vessels with annular and spiral thickenings; F, libriform cells, G, glandular hair from the leaf.

entiating character.

The tendency of this plant to produce mechanical cells is further shown by the fact that some of the cells of the pith as well as of the cortex are thick-walled, strongly lignified, the walls being marked by rather fine simple pores (figures B and D). These cells as they occur in the pith are either cubical, or elongated with square ends, while those in the cortex are nar-

row, with pointed or oblique ends, and from 100 to 300 microns in length. Somewhat similar stone cells are found in the stem of *phlox pilosa* L. If the material containing these cells should be relatively abundant in a mixture, their presence would give another character for distinguishing the rhizome of *phlox* from that of *spigelia*. The stone cells in *ruellia* are different in shape, and in addition are associated with cells containing calcium carbonate. The presence of these special, thick-walled lignified cells in the rhizome of *phlox* may, however, be of infrequent occurrence, like the bast fibers in *belladonna*, which I have only occasionally seen, but which have been described by Schrenk, and therefore may not be of assistance in the identification of the drug. It might be mentioned in this connection, however, that groups of bast fibers have been found in *phlox aristata* Michx., and a ring of bast fibers in the stem of *phlox longifolia* Nutt., *phlox douglassi* Hook., and *phlox acuminata* Pursh.

Histological Characters of Root.—A transverse section of the root shows (1) ordinary epidermal cells with root-hairs; (2) a hypodermis made up of radially elongated, more or less pentagonal cells; (3) a cortex, consisting of 12 to 20 rows of ellipsoidal rather thin-walled parenchymatous cells, which are rich in protoplasm and may contain small starch grains; (4) a peripheral layer of the central cylinder; (5) endodermis; (6) internal layer of cortex, and (7) within this there is in the very young roots a triarch to pentarch radial fibrovascular bundle, which later becomes collateral and closely resembles in structure that of the rhizome.

While the stem is free from hairs the leaves have rather striking glandular hairs (figure G), which are found on the principal veins near the base of the leaf. The histological characters of the leaf have been very well given by Holm, and it therefore does not seem necessary to consider them here.

I may say in conclusion that I am engaged in the study of the structure of the underground parts of other species of *phlox*, as possibly the rhizomes and roots of other species may occur as admixtures in drugs, and besides the genus is of great interest botanically.

[Those who wish to pursue the study of this subject further will doubtless be interested in the following articles which appear in recent issues of the CIRCULAR: "Ruellia as a Spigelia Substitute," by William Mansfield, *Phar. D.*, March, 1909, page 110; and "A Contribution to the History of Pinkroot," by M. I. Wilbert, November, 1909, page 573. There are also notes and references germane to the subject in the issue of the CIRCULAR for August, 1908, pages 359 and 370; March, 1909, page 107; December, 1909, page 626; and January, 1910, page 12.—Editor THE DRUGGISTS CIRCULAR.]

Indelible Ink.

As a formula for an ink to be used in marking linens which are to be bleached with chlorine, the *Chemist and Druggist* offers the following:

Coal tar.....	20 ounces.
Benzol.....	25 ounces.
Lampblack.....	3 ounces.
Mix well. The liquid is very inflammable.	

Silver Coating without a Battery.

Two processes for depositing silver on brass or copper articles are given in the *Brass World*. They follow:

To procure the best results, the bath should be prepared with care and kept free from contamination with foreign matter. To prepare it take 2 ounces of fine silver (preferably in grain form) and dissolve it in nitric acid. This solution of nitrate of silver is next added to 1 gallon of distilled water and a strong solution of common salt poured in. This will precipitate the silver in the form of chloride. This precipitate is then washed in a thorough manner to remove all traces of acid, and the last rinse water should be tested with blue litmus paper to make sure that all the acid is removed. The chloride of silver thus formed is next mixed with an equal amount of cream of tartar and sufficient water to form a mass of the consistency of cream. The articles, after having been thoroughly cleaned or dipped, are immersed and stirred about until they are sufficiently white, when they are rinsed in hot water and shaken up in sawdust to dry.

An excellent formula and one extensively used is as follows:

a. Water	1 gallon.
Silver nitrate, crystals.....	1/4 ounce.
b. Water	1 gallon.
Potassium cyanide.....	1 pound.

Add solution *b* to *a* (pour the potassium cyanide solution into that of the silver nitrate) little by little with stirring. A precipitate is at first formed which then is dissolved. When no more of the precipitate will dissolve, add no more. If any precipitate remains undissolved after vigorous stirring, then add a little more of the cyanide until it just barely dissolves. The object is to use just enough of the cyanide solution to dissolve the silver nitrate and no more. In this manner no free cyanide is present. Use the solution hot at a temperature of about 150° F. If the dip contains much free cyanide, the silver will come dull and yellow. By using no free cyanide, it will deposit on the work in a perfectly white and bright condition. The secret of bright dip silvering is to have no free cyanide.

The cyanides being extremely poisonous, care should be taken to provide against their contact with the skin for fear of absorption through unobserved abrasions.

Dry Mountant for Photographs.

Dry-mounting tissue is made by painting tissue-paper, laid on a waxed glass surface, with the following liquid:

Sandarac	1 ounce.
Copal	3 ounces.
Shellac	4 ounces.
Resin	3 ounces.
Venice turpentine.....	2 ounces.
Alcohol	11 ounces.
Oil of turpentine.....	11 ounces.

The impregnated paper is allowed to dry spontaneously; then it is stripped from the glass, and cut into pieces of the desired size. For use, a piece of the exact size of the print is placed between it and the mount, a piece of thin paper is placed over the print, and the whole is evenly pressed with a hot iron.

Combatting the Traffic in Morphine and Cocaine.

On December 14th last there was a hearing before the committee on ways and means of the national house of representatives on certain bills introduced by Representative Foster, of Vermont, for the purpose of restricting the sale of opium and other narcotics. Among those addressing the committee were Dr. Hamilton Wright, American delegate to the International Opium Commission; Dr. William Jay Schiefelin, of New York, president of the National Wholesale Druggists' Association; and Dr. George D. Rosengarten, and Christopher Koch, of Philadelphia. The remarks of the latter are of especial interest as showing some of the inside workings of the crusade against the narcotic evil, and some of the details of the evil as actually shown to exist. During the course of his address to the committee, Mr. Koch was interrupted a number of times by members who wanted certain statements repeated or elucidated, by remarks from others attending the hearing, and by an adjournment or two. Eliminating most of these interruptions, repetitions, etc., the gist of Mr. Koch's remarks, as officially reported, was as follows:

Mr. Chairman and gentlemen of the committee, I have with me a collection of dope, consisting of cocaine, opium, opium layouts, and various "cures" that we seized in the recent crusade that was carried on in the State of Pennsylvania—and more particularly in the city of Philadelphia.

I might say that I happen to be the vice-president of the State Pharmaceutical Examining Board of Pennsylvania and have conducted during the last year a crusade, particularly in the city of Philadelphia, to wipe out the illegal sale of cocaine and morphine. If it is the pleasure of the committee, I would like to show these exhibits.

The question of narcotics is one that is very little understood by the layman. I, personally, am entirely in accord with Dr. Hamilton Wright, and the result of my investigation has proved absolutely the facts which he brings forth in his report.

CONSUMPTION OF OPIUM IN THE UNITED STATES.

I will hurriedly go over a few of these facts. In the decade from 1860 to 1869 the consumption of opium in the United States was 1,425,196 pounds; in the decade from 1900 to 1909 the consumption was 6,435,623 pounds. The increase in population during that time was 133 per cent. The increase in the consumption of opium was 351 per cent. In other words, the consumption of opium increased almost three times as rapidly as the population.

There are in the United States, according to Dr. Hamilton Wright, about 120,000 Chinese, and 35 per cent. of the Chinese consume about 100,000 pounds of smoking opium. There is absolutely no legitimate use for smoking opium. The only thing it is used for is smoking. There are also 150,000 Americans in the United States who smoke opium, and they consume about 68,000 pounds of smoking opium annually.

Dr. Wright has visited all the cities in the United States, and he has visited all the institutions and gone through the Chinatowns and the penal institutions, and by a process of deduction he gets those figures. That is gone into in great detail in his report. My experience proves that those figures are correct. In the Chinatown in the city of Philadelphia there are enormous quantities of opium consumed, and it is quite common, gentlemen, for these Chinese or "Chinks," as they are called, to have as a concubine a white woman. There is one particular house where I would say there are fifty white women living with Chinamen as their common-law wives. The Chinamen require these women to do no work, and they do nothing at all but smoke opium day and night. A great many of the girls are girls of good family, and the history of some of them is very pathetic. You will find those girls in their younger days went out with sporty boys, and they got to drinking. The next step was cigarettes. Then they go to the Chinese restaurants, and after they go there a couple of times and get a drink in them they want to "hit the pipe." They do it either out of curiosity or pure devilish-

ness. These drugs are all very seductive—cocaine even more so than opium. Finally they find that the pipe fails to satisfy them and they take to morphine or laudanum. They go down a step further and then learn the use of the hypodermic syringe. After that they get drowsy or melancholy and they want something to brace them up and regenerate them. That is where cocaine comes in. Cocaine produces an intense exhilaration, while morphine is just the opposite.

Italy, with a population of 33,000,000, consumes about 6,000 pounds of opium annually. Austria, with a population of 46,000,000, consumes between 3,000 and 4,000 pounds annually. Germany, with a population of 60,000,000, consumes about 17,000 pounds annually. Holland, with a population of 6,000,000, consumes 3,000 pounds annually. Adding up the population of these four countries we have 145,000,000 people in those four countries, and they use about 30,000 pounds of opium. The United States, with a population of about 91,000,000, used last year 400,000 pounds of opium, which is more than thirteen times as much as was used by the combined population of those other countries.

Mr. DALZELL. In those other countries is the consumption legitimate?

Dr. KOCH. It is legitimate; yes, sir. They have drastic laws which make it impossible to buy these drugs except on the prescription of a physician. It has been estimated that of the 400,000 pounds of opium which we import, 25 per cent. is all that is used legitimately. In other words, 300,000 pounds of opium are used illegitimately every year. Eighty per cent. of these 400,000 pounds of opium is manufactured into morphine, and 75 per cent. of all of the morphine that is manufactured is consumed by "dopes."

NINETY PER CENT. OF COCAINE USED BY "FIENDS."

Now, we come to cocaine. Cocaine is a drug which has been known only about twenty or twenty-five years.* During that time the manufacture has risen from nothing to 150,000 ounces every year. It has been estimated that 90 per cent. or 135,000 ounces of cocaine goes to make "fiends" out of human beings. Ninety per cent. of it, gentlemen!

COCAINE AND CRIME.

The colored race in the South, I have reason to believe, is very much perverted by cocaine. Dr. Hamilton Wright is my authority for stating that down on the plantations they lace the liquor with it. A great many of the crimes that are committed in Pennsylvania (and from information received from other States, a great many of the crimes committed there as well) are traced directly to cocaine.

The colored population in Philadelphia is full of it, or was. We have cleaned it up. The colored people seem to have a weakness for it. It is a very seductive drug, and it produces intense exhilaration. Persons under the influence of it believe they are millionaires. They have an exaggerated ego. They imagine they can lift this building, if they want to, or can do anything they want to. They have no regard for right or wrong. It produces a kind of temporary insanity. They would just as leave rape a woman as anything else and a great many of the Southern rape cases have been traced to cocaine. It is not confined to the colored race entirely. Lots of white people use it, too. I am sorry to say that lots of professional people use it—people who ought to know better; I mean lawyers, physicians—physicians principally—and some pharmacists and trained nurses.

HOW COCAINE IS USED.

There [indicating] is some cocaine that we seized in a raid in Philadelphia. The way they use the cocaine—the colored people and other people—is this: They have a little lid or something, and they have a little blunt instrument. They put one or two of the crystals like these [indicating] in the lid, and they break it up with what they call the "crusher." They grind it up to a powder. A good many of them will use a blower. They simply put the powder in a glass tube, put the tube up the nose, stick this rubber tube in the mouth, and blow it up their nostril [illustrating]. Some will use the tube without the rubber and

*Cocaine was first isolated in 1855 when it was called erythroxyline. Cocaine is mentioned by that name in the Circular for August, 1860, the dieresis showing that it was pronounced correctly (as three syllables). In November, 1886, we printed a demand for legislation to prohibit its sale except on prescription.—Editor THE DRUGGISTS CIRCULAR.

just sniff it up the nose in that way [illustrating]. Some of them will put it on the back of the hand and sniff it up in that way [illustrating].

Mr. CLARK. They take it in powdered form. I know all about it in the town I live in. If you give one of them a dime's worth of cocaine, it makes him crazy as a bedbug.

Dr. KOCH. That is what it does, Mr. Clark. It has been estimated that 6 per cent. of all the persons entering our penal institutions are addicted to some kind of a dope habit, in the way of morphine, cocaine, or the opium pipe.

Mr. CLARK. We have a law out in Missouri that puts an end to that. We fine them \$100 once or twice and send them to jail, and they quit selling it.

Dr. KOCH. There is a certain retail druggist in St. Louis who disposes of about 200 ounces a month.

Mr. CLARK. They will get him, too.

THE PERCENTAGE OF PEOPLE WHO ARE "FIENDS."

Dr. KOCH. They ought to get him. Forty-five to 48 per cent. of all criminals are dopes. That is almost 50 per cent.; 21.6 per cent. of lewd women are dopes; 2.06 per cent. of the medical profession are dopes; 1.32 per cent. of trained nurses are dopes; 0.684 of other professions and 0.16 per cent. of other adults are dopes.

I think the professional people who use those drugs use them when they are run down and have a lot of work to do. They take drugs to either suppress nervousness or brace them up. They take morphine to quiet them, and they take cocaine to brace them up. It seems strange, but nevertheless it is true, that the people who know most about it fall for these things themselves.

When a person first starts to take it, the effects are much more lasting. After the system becomes used to it the doses become larger and are repeated at very much shorter intervals. We arrested a man in Philadelphia who, in a sworn statement, stated that he took one ounce of cocaine in three days. The average dose in a prescription would be a quarter or half a grain, and there are about 437 grains in an ounce, so you can see the enormous quantities that they can consume.

Mr. HILL. How long would that man live, continuing that?

Dr. KOCH. This fellow is about twenty-five years of age, I should think. I would say that he would not live more than five or six years if he kept it up at that rate.

LOCATING THE GUILTY DEALERS IN PHILADELPHIA.

In the city of Philadelphia it became my duty, as a member of the pharmacy board, to investigate this traffic, and some of the things we discovered there, gentlemen, were horrible.

Along about a year ago one of my detectives, Joseph Di Giovanni, came to me and said: "Doctor, here is some cocaine that I bought." I said, "Where did you get it, Joe." He told me a certain address on Lombard street. "Well," I said, "go down and shadow the place and see what you can get." He reported to me the next day, and he brought me another package, and he said, "That place is frequented by young boys and girls." I said, "Watch it." Well, he watched it for a few days longer, and this is what we discovered. We would find groups of five or six youngsters ranging from twelve to sixteen years of age coming up Eleventh street to the corner of a little street known as Naudain street. One of the number, just one, would go down Naudain street and go into this place, 1014 Lombard street. The entrance was from the rear. There was a long alley-way, and at the head of the alley-way there was a door. The door had a wire grating over its upper half, and on coming up to the door you pressed a little electric button. Instead of the door opening, they would let down a panel of it, which was hinged on the inside, and a colored man would stick his face out. If he knew you, you handed in your money and got your dope. If he did not know you, he would kick you out. We found that this place was frequented by possibly thirty or forty of these youngsters, a good many of them Italians, and boys supposed to be attending school.

The condition was so horrible that we resolved to break the practice up at any cost. Our board has no State appropriation, and I went to one of the leading attorneys in Philadelphia, Samuel M. Clement, Jr., and explained the situation to him. He was so shocked he immediately volunteered his services. Through the aid of Mr. Clement we secured the co-operation of Director of Public Safety Henry Clay, who placed city detectives at our disposal. Upon further investigation we found that this "hell hole" was absolutely as I have stated. These school children were tak-

ing this terrible drug and ruining their lives. The newspapers made quite a hurrah about it, and said that we were faking it.

Gentlemen, we had the proprietors of that place in court in about ten days, and we had the goods in court. We had six of these school children in court, and they were so small you could barely see their heads over the witness box. We convicted the two negroes and they were sentenced to three years in prison.

Now, gentlemen, here is a jar of cocaine [indicating] that we seized there. Here is a bag containing the cocaine in the way in which they sold it, in these little packages [indicating]. We seized over 1,000 of these packages. These youngsters would buy these packages at 10 cents apiece.

MANUFACTURING THIEVES AND MURDERERS.

Mr. LONGWORTH. How much is there in there?

Dr. KOCH. One or two grains. These boys would steal the money to buy it. After they get the "habit" they must have it, and these little kids were petty thieves. They would steal the money from their mothers' pocketbooks; and around in that section I found on investigation real-estate men were missing a lot of lead pipe, brass cocks, etc., from vacant houses. The theft of these was traced to these boys. They would steal these things to get the money to buy "coke."

As these boys get older the habit grows stronger, and they have to have more "coke." They will not work. Their crimes become greater, and these are the fellows that eventually wind up as desperate criminals—the man who shoots to kill if discovered in his robberies. In my judgment, there is very little hope for them. You can cure them if you remove the drug and keep them where they can not get it; but as soon as you remove the restraint, cocaine being so seductive and having such a strong hold on them, they go right back to it.

ACCOUNT BOOKS OF A COCAINE DEALER.

There was another place in the city of Philadelphia known as Blake's place, where a man Blake lived with a blond woman. This woman, about a year before we arrested her, was a woman weighing, I should say, about 160 or 165 pounds. She acquired the habit, and at the end of one year she was a wreck. The man, a fellow about twenty-five years of age, was the same way. He had been an opium smoker, and from that he drifted to morphine, and finally to cocaine. This fellow was very methodical and kept books, and in his books we find every day his entry of sales of cocaine. Gentlemen, mark you, this is a secret practice. Drug habits are all secret vices. Everything connected with it is done in secrecy, and see how careful they are, so as not to get caught. They sold it only to persons they knew or who were vouched for by somebody that was "all right." Every time he sold it he would mark down the name of the person who bought. He has here: "Tot, 50 cents; Tick, 50 cents; Emma, \$1; Turkey, 25 cents; Buck, 40 cents; Pete, 40 cents," and so on down the line. This fellow had a number of these books, and here is a scale [indicating] that we took from him, on which he weighed the stuff. These rubbers, we also got there. These are blowers. They use these for taking the powder. Our State laws can and do prohibit the sale of cocaine, but not these blowers. Here [indicating] is some catarrh powder that we seized at this place. It contains eight grains of cocaine to the ounce. Under the federal law you can not prohibit the manufacture of this, but the State law can. The federal law can regulate its sale by such a bill as is proposed by my friend Dr. Wright.

Mr. DALZELL. Does that contain on the package a statement—

Dr. KOCH. A statement that it contains eight grains of cocaine to the ounce.

AN OPIUM LAYOUT.

Here is something else that we got at Blake's place [indicating]. This is an opium layout, gentlemen. I do not know whether you have ever seen one. [Laughter]. I think it might be interesting. Now, if it is your pleasure, I will show you how they use this [indicating opium pipe]. I will not smoke it, but I will show you how it is done.

The extent of a man's habit is regulated by the number of pills he smokes. A moderate smoker will smoke maybe five or ten or fifteen pills. A smoker with a bad habit will smoke fifty or one hundred pills. He will take his time; an inveterate smoker will smoke maybe four or five hours. The common belief is that opium makes them sleep. At

first it does, but after they acquire the habit it does not. A confirmed opium smoker gets no effect from the drug. It is merely the want of the drug that affects him. When he has not got the drug, that is when he feels bad. They have what they call their "habit," and they must satisfy it. It becomes like food to them. When they want to smoke they will get up and stretch and work around in this way [illustrating]. That is the way you can tell their habit is coming on them. Opium and morphine are very much the worst drugs for the individual. Cocaine is the worst drug so far as society is concerned. A man under the influence of cocaine is a dangerous man. At the time of Blake's arrest we seized over 1,000 of these empty bottles [indicating]. There was a whole loft full—that is the catarrh powder.

DETECTIVE CATCHES A TARTAR.

In another place we served a warrant on a little bit of a negro wench who weighed less than 100 pounds. The detective read the warrant and she said: "All right, I will go along with you." She was lying in bed, with her clothes on, and she got out of bed, as he thought, and in getting up she pulled this knife [indicating] from under the pillow. She was just about to stab him in his groin, and if it had not been that there were two of them she would have stuck it in him. She was "junked up" with "coke." There was a tussle. She bit one detective on the thumb and the other one she bit on the arm, right through his clothes.

I have here various other implements that we seized [indicating].

Mr. HILL. This powder is taken through the nose, you say?

Dr. KOCH. It is taken through the nose; yes, sir.

Mr. DALZELL. I see by the label that this is made in New York.

HOW COCAINE IS PEDDLED.

Dr. KOCH. That is not made in Pennsylvania. We will take care of that. Cocaine is largely sold by pedlers. The pedler goes around and usually carries it in cigarette boxes or match boxes. Here is one that we got in a cigar case [indicating]. Here are more cigarette boxes [indicating]. These fellows go around through the Tenderloin and peddle it to anybody that wants it. They have it in little packages, the same as I showed you, which they sell at 10 cents a package. The fellow that peddles it, in turn gets it from a fellow who buys it from another fellow in about one dram to half-ounce or ounce lots. The fellow that gets it in dram to half-ounce to ounce lots buys it from a third fellow who buys in anywhere from one- to five-ounce lots, and he in turn gets it from the druggist. In Philadelphia there are less than 1 per cent. of the druggists that dealt in the stuff. A few druggists in the Tenderloin have the monopoly, and they get it from the wholesale druggists.

The sale from the manufacturer to the wholesale druggist, and from the wholesale druggist to the retail druggist, is legitimate. We can trace that by the records furnished us; but after it reached the druggist we were stuck. So we set up in the cocaine business ourselves. We rented a room in the Tenderloin, got a couple of "cokers," and kept them a couple of months. We fed them anything they wanted. We "loosened up." If they wanted a quarter we gave it to them. If they wanted "coke" we gave it to them. First we got the users coming around. From them we worked up to the pedler; from pedler to the small dealer; from there to the larger dealer; and then to the wholesale illegitimate dealer; and there we were stuck again. On the 28th of March we hurried over to the police department fifty-eight warrants. We had warrants for all these fellows, including about ten large wholesale illegitimate dealers. We knew these fellows were buying the stuff, but we could not connect them with the druggist. We arrested them, and held them for hearing thirty days later, and they were sent to the county prison. After they had been there eight or ten days, and realized that two or three years' imprisonment stared them in the face, they sent for me. I saw them, and they were willing to make statements.

We brought them up to Mr. Clement's office one at a time, and we took their statements. Those are a bunch of the statements [indicating]. Ordinarily, I would not believe the word of a dope fiend, but here we had statements from all the large dope dealers. Gentlemen, strange to say, every one of their statements interlocked. As the result of those statements we got the druggists, and we took them into court and convicted them. Out of about seventy-five

cases we lost only two. One of them we deserved to lose, and the other was a miscarriage of justice.

PROFIT IN THE BUSINESS.

Mr. BOUTELL. What is the actual value of the stuff they sold for 10 cents.

Dr. KOCH. It costs about \$3.50 or \$3.75 an ounce. From these statements we learned that these fellows who had access to these few druggists paid at the rate of \$6 and \$8 an ounce for it to the druggist. In other words, the druggist would buy it for \$3.50 and sell it to these other fellows for from \$6 to \$8. They would average from \$25 to \$40 profit on an ounce, the 10-cent package costing them 1 or 2 cents.

We found by these statements that there was one druggist in Philadelphia who would sell to one of these poor unfortunate dopes at one sale \$100 worth of cocaine every Saturday, and we found that this druggist, who had most of these dopes as customers, had an agent on the street who did nothing but solicit orders from these dope dealers. We found there was another druggist that would buy morphine in 100-ounce lots every month. He would contract every three months for 100 ounces of morphine a month. That store in the Tenderloin would sell from twelve o'clock midnight until five o'clock in the morning about 5 ounces of morphine, and an ounce of morphine will last an ordinary druggist three or four months. An ounce of cocaine will last the average druggist for one year. That statement is based on the records of the reports to us by wholesale dealers and manufacturers in the State of Pennsylvania, and I think Dr. Schieffelin will bear me out in that.

We also found, gentlemen, in the city of Philadelphia, that the inspector of drugs for the port of Philadelphia—that is, the United States inspector of drugs—was dealing in cocaine on the side. He had access to a large manufacturing house, and he would go there and buy the stuff and then turn it over to these dopes. He would buy 20 ounces at a time at the wholesale price of \$2.50 an ounce, and he would turn it right over to another fellow who would wait for him on the outside at \$6 an ounce.

FILTHY HYPODERMIC SYRINGES IN USE.

Now, gentlemen, those are some of the conditions that we found in the abuse of these drugs. In Pennsylvania we have a cocaine law.

By the way, I want to show you a few hypodermic syringes that we took from these fellows. There is a choice collection here of all kinds of hypodermic syringes [indicating], and I might show you how some of these fellows use them. The fellow who used this syringe was a man by the name of "Dory Rose." This is broken, but I will demonstrate with this. He had a dirty old silver spoon that he would use. He had this dirty, filthy bottle [indicating]. He would put the morphine in the bottle and melt it with the heat of a match and then pour it into the spoon and suck it up with the syringe from the spoon. Then he would jab this needle right through his coat into his arm. That fellow's body was one mass of small holes and running sores. These fellows who used these needles have absolutely no knowledge of antiseptics, and they get running sores all over their bodies.

This particular place that Ashmead [the drug inspector for the port of Philadelphia] frequented had what they called "hypo parties." There would be eight or nine mixed couples. They were all dopes, and they all used the needle. They would go through all sorts of orgies, and at a given time they would throw up their legs and all "take a shot" from their hypodermic syringe.

INTERSTATE BUSINESS IN MORPHINE AND COCAINE.

Here [indicating] is a bottle of so-called morphine cure. It contains nothing but morphine. There are a number of these that were exposed by Dr. Wiley and the American Medical Association, and this is one that we got in Pennsylvania.

This is the way they sold morphine [indicating]. Morphine was sold in these stores without any label. It contained no poison label, and it was sold indiscriminately. Anybody could buy it that had the price.

We thought in the city of Philadelphia, and in the State of Pennsylvania, that we could control it. We cleaned it out of the city of Philadelphia, but since we cleaned it out in Philadelphia they have started bringing it in from Camden, New York, and Trenton. They would have runners who did nothing but go from one State to the other. The system of reports that we have in Pennsylvania makes it

necessary for the manufacturer to report his sales. These are some of the reports [indicating], and some of the revelations in these reports should indicate to you the necessity for an interstate law. We find that States such as Georgia, North Carolina, South Carolina, Missouri, Ohio, and a few others, are buying cocaine in Pennsylvania in large quantities. There is a certain doctor in the city of Mount Gilead, Ohio, who buys every month from one of our manufacturers 256 ounces of cocaine. In one month he bought 384 ounces and in another month 512 ounces. Remember, gentlemen, the average consumption of cocaine is less than 1 ounce per year per druggist. This man is a doctor. What does he do with it? I do not know.

We find in the city of St. Louis, Mo., a little bit of a druggist, not even rated in Dun or Bradstreet, buying 200 ounces of cocaine a month. In the city of Augusta, Ga., a number of druggists are buying 20, 25, and 50 ounces, and some 100 ounces every month. What are we to do in Pennsylvania? We are powerless. We can not do anything. We find they are sending it into our State from New York. There is a large manufacturing concern that does business all over the United States that has agents in Pennsylvania selling cocaine along with other drugs. Their agents make the statement, "Buy from us. It is not reported to the State board. The State board does not know anything about it." That concern is one of the largest in the world, and we have asked them to give us reports. They say: "We do not have to make reports to you people. We do not do business in Pennsylvania. Our office is in New York." We are powerless. That concern supplies a good deal of the cocaine that goes wrong in our State, and there is no way of reaching people of that kind except by an interstate law.

I have here several letters. I have one letter mailed to a man in Atlantic City, N. J., trying to work up a cocaine business in another State—sending it from one State to the other. Here is another letter from a concern in St. Louis, Mo., soliciting orders for morphine—and this letter, gentlemen, was sent to an inmate of the Norristown Insane Asylum, at Norristown, Pa., who was there as a result of the drug habit. These sharks follow their victims to the grave. They sent this letter to this poor unfortunate still soliciting orders for morphine. That is interstate, and we can not touch it.

Now, gentlemen, I think I have shown you that this is a secret and a vile habit, and that the only way to eradicate it is to eliminate the secrecy. There is no better way of eliminating the secrecy than by turning on the lime-light. This bill before you is the way to do it.

Dr. Schieffelin, Dr. Wright, and Dr. Rosengarten spoke somewhat along the same lines, and W. S. Richardson, representing the National Association of Retail Druggists, presented the resolutions adopted at the 1910 meeting of that organization in favor of restricting the sale of habit-forming drugs, especially the interstate traffic in them. Further reference to hearings on this bill are made in the news columns of this issue.

Bitterless Fluidextract of Cascara.

Börner (*Apoth. Zeit.*) suggests the following process for making a fluidextract of cascara sagrada free from the bitter principles:

Cascara sagrada.....	1000 grammes.
Freshly slaked lime.....	35 grammes.
Citric acid.....	enough.
Distilled water.....	enough.
Alcohol.....	150 grammes.
Glycerin.....	150 grammes.

Mix the ground bark with the lime, and extract to exhaustion with distilled water in a steam bath. Evaporate the extract to about 5000 grammes, and neutralize with citric acid while hot. Allow the liquid to cool, then heat slowly to 100° C. and strain. Evaporate the liquid to 700 grammes; mix the alcohol and the glycerin and add to the liquid, and after it has stood for a few days, filter the extract.

Simple Treatment for Corns.

In the method of treating corns to be described a writer in the *St. Louis Medical Review* depends upon the macerating power of ordinary adhesive plaster to effect the result sought. A strip of this material from $\frac{3}{8}$ to $\frac{1}{2}$ an inch in width and 4 to 6 inches long is to be applied in spiral fashion to the affected toe, covering the digit from neck to nail. The degree of tightness of the application deserves consideration, to avoid compression. However, the feelings of the patient when stepping upon the foot will serve as an adequate guide in this matter. Given instructions to cut through the plaster lengthwise or to soak off the entire dressing by immersion in a hot water foot bath affords ample protection in cases of undetected microbic infection. Soaking the foot for ten to twenty minutes in water at a temperature of 110° F. with gentle removal, by rubbing with a piece of sterilized pumice stone or forceps, of the crown of hardened epidermis shortens the time of treatment. Properly applied the plaster strap dressing should afford relief from the moment of its application and may be worn continuously for from one to six or eight weeks—bathing seeming not to affect the adhesive properties of the plaster after it has once set. Removal of the dressing at the end of an adequate time reveals the corns completely freed when it may be picked out entire by means of a dressing forceps or after an additional soaking. A wisp of absorbent cotton held on by means of a narrow adhesive strap may be subsequently worn for a few days.

For Mange in Swine.

Linseed oil.....	1 pint.
Sulphur.....	4 ounces.
Camphor.....	$\frac{1}{2}$ ounce.

Old-Fashioned Cough Candy.

Canada snake-root.....	1 ounce.
Pectoral species.....	2 ounces.
Sugar.....	12 pounds.
Molasses.....	8 ounces.
Oil of wintergreen.....	10 minims.
Oil of sassafras.....	10 minims.
Oil of anise.....	10 minims.
Water.....	enough.

Make a decoction of the herbs with 4 pints of water, and strain. Cook the sugar, the molasses and a little water until it forms a homogeneous mass; slowly stir in the decoction, and cook the batch to 310°. Pour the mass on an oiled slab; and as it cools, incorporate the oils. Finally cut it into drops of the desired size.

Syrup of Horehound.

Horehound herb, contused.....	7 ounces.
Sugar.....	13 ounces.
Boiling water.....	enough.
Water.....	enough to make 1 pint.

Digest the herb for one hour, on a water bath with enough boiling water to cover it. Strain, press, and evaporate to 7 ounces, cool and filter. This liquid must be filtered cold, and in it must be dissolved the sugar, with gentle heat. Finally add enough water to make the whole measure 1 pint.

Abstracts

Poisoning by Aconite.

A case of aconite poisoning resulting from the inadvertent taking of half an ounce of a liniment is reported by Edgcombe (*Lancet*). The liniment was a mixture of aconite liniment 4 parts, belladonna liniment 4 parts, chloroform liniment 4 parts, tincture of capsicum 4 parts, and oil of gaultheria 8 parts. Recovery followed the hypodermic injection of 10 minims of solution of strychnine and a hot rectal injection of 8 ounces of strong coffee, the patient being wrapped in hot blankets, and hot-water bottles applied. Noticeable features of the case were the absence of any odor of gaultheria about the patient until he vomited on the introduction of the stomach-tube, and the absence of dilation of the pupils, which might have been expected after such a large dose of belladonna. These features for a time caused the physicians in attendance to doubt whether the case was really one of poisoning.

Detection of Small Quantities of Nickel.

Bianchi and DiNola (*Boll. chim. farm. through Chem. Zeit.*) have found the following reaction useful for detecting small quantities of nickel. The substance under examination is dissolved in a few drops of concentrated hydrochloric or nitric acid, the solution rinsed with a little water into a porcelain dish, made alkaline with ammonia, acidulated again with acetic acid and mixed with a saturated solution of dimethylglyoxime solution. In the presence of nickel a persistent red color will be produced in the liquid, becoming more intense after standing for a short time. The presence of iron and copper does not interfere with this reaction.

The Seed of *Camellia Japonica*.

Kitamura (*Journ. pharm. soc. Jap.*) has succeeded in isolating from the seeds of *camellia japonica* a crystalline substance, which he has called camellin, and which is present in the seeds to an extent of three per cent. It occurs as white plates, melts at 181-184° C. and possesses the empirical formula $C_{15}H_{32}O_7$. It is almost insoluble in water, slightly soluble in cold alcohol, easily soluble in hot 80 per cent. alcohol. The author has prepared tetracetyl and benzoyl derivatives of camellin and has found that the latter gives on hydrolysis a colorless syrupy substance and a sugar, resembling rhamose.

Bismuth a Possible Tenuicide.

A correspondent of the *American Journal of Clinical Medicine* reports a case in which three unsuccessful attempts were made to relieve a child of a tape worm, the medicine being vomited; for disturbance of the stomach, pepsin, hydrochloric acid, and bismuth subnitrate were given and in two weeks the worm was passed, colored deeply by the bismuth. He asks: "What part did the bismuth play in expelling the worm?" In an answer by the editor it is said: "We have heard of tapeworms being voided by patients receiving bismuth for other disorders. Some experiments in this direction might prove instructive."

Some Color Reactions of Adrenine and Allied Bases.

Ewins (*Journ. Physiol. through Pharm. Journ.*) reports an investigation of the more characteristic color reactions which from time to time have been suggested for the identification or estimation of adrenine, and the following have been described: (1) The production of a rose-red color on the addition of iodine (Vulpian). (2) The formation of a red color on the addition of mercuric chloride (Comessatti). (3) The production of a reddish-violet color by the action of potassium bi-iodate and phosphoric acid (Fränkel and Allers), or by the action of iodic acid (Krauss). With solutions of the pure base, the delicacy of Vulpian's reaction is very great; a distinct reaction is obtainable with solutions of one of the hydrochloride (or other salt) of adrenine in 1,000,000. The color is apparently due to oxidation under the influence of iodine, the same color being produced by the action of other oxidizing agents, or when dilute neutral solutions of adrenine are allowed to stand exposed to light and air. The Comessatti reaction is considered by the author to be a particular instance of a general reaction. The following details are given to ensure the reaction being obtained with certainty: To 1 c.c. (mil) of a dilute solution (1:100,000) of adrenine in distilled water is added an equal volume of a solution of sodium acetate (1 per cent.), followed by 4 to 5 drops of a solution of mercuric chloride in distilled water (1:1,000). If the solution now be warmed to 40°-50° a rose-red color is immediately obtained. At the laboratory temperature (15°) a pale rose tint is obtained after four or five minutes. The use of sodium acetate ensures uniform results. In the Fränkel-Allers reaction it appears that free iodine plays an important part, but it is modified to some extent by the conditions under which it is made. It is a very delicate test; a distinct reaction may be obtained with a solution of one of adrenine in one million. The reaction has been modified and intensified by G. Bayer, who adds sulphanilic acid to the solution as prepared by Fränkel and Allers; a yellow color instead of the normal rose tint is produced, and is seen in a solution of one of adrenine in five millions. Potassium persulphate oxidizes adrenine, giving a characteristic red color. This reaction has advantages over those mentioned both in sensitiveness and in being readily obtained with crude extracts of the glands, etc. The characteristic color reactions of adrenine are given by other closely related bases, namely, by (a) the amino base corresponding to adrenine; (b) dihydroxy-phenylethylamine and the corresponding methyl, ethyl and propylamine base; (c) aminoaceto pyrogallol. The bases of the type aminoaceto catechol do not give these reactions.

Physico-Chemical Studies of Rubber.

Hinrichsen (*Zeit. ang. Chem. through Journ. Franklin Inst.*) summarizes the more recent contributions to the chemistry of rubber. The author regards the constitution of the hydrocarbon as being definitely settled by the researches of Harries, and refers to the possibility of synthetic production. The determination of the molecular weight of the substance present in the globules of the latex has given results which indicate that this substance is not the comparatively

simple compound supposed by Weber, the molecular weight being about 3000. The rubber is undoubtedly present in the latex as a typical colloid. The recent work on the optical activity of the rubber resins and on vulcanization by sulphur chloride is referred to. The reaction in vulcanization appears to be a true chemical reaction, but in presence of moisture, it is accompanied by the formation of sulphur chloride which is absorbed by the rubber. The maximum addition of S_2Cl_2 is represented by the formula $(C_{10}H_{16})_2 S_2Cl_2$.

Separation of Solid and Liquid Fatty Acids.

On the property of solid fatty acids of being insoluble in an excess of ammonia water when kept at a temperature of $14^\circ C$., David (*Compt. rend.*) has based a process of estimating these acids in mixtures with liquid fatty acids, the latter being perfectly soluble in ammonia water under the same conditions. Two grammes of the mixture of the acids are dissolved in 5 c.c. (mils) of hot 95 per cent. alcohol, mixed with 50 c.c. (mils) of ammonia water (22°), the mixture heated until gas bubbles are formed and then allowed to stand for several hours, preferably over night, at a temperature of $14^\circ C$. The ammonium salts are then collected on a filter, washed with ammonia water until the filtrate no longer gives a cloudiness with baryta water, and then decomposed on the filter by the addition of diluted hydrochloric acid. After thorough washing, the acids are dried in the usual way and weighed. The results thus obtained are said to be accurate within 0.2 to 0.3 per cent. By this method stearic acid, palmitic acid, oxy-stearic acid, isooleic acid, laurinic acid and arachidic acid can easily be separated from oleic acid.

White Phosphorus Matches Prohibited in Great Britain.

An act prohibiting the manufacture or sale of white phosphorus matches in Great Britain, or their importation, came into force January 1st, 1910, so far as the manufacture and importation of such matches were concerned, but a clause was inserted suspending its operation for a year, as to their retail sale, in order to enable stocks to be cleared. This clause, which makes it unlawful for any person to sell or to offer or expose for sale or to have in his possession for the purpose of sale any matches made with white phosphorus, therefore took effect with the beginning of the present year. The congress of the United States has under consideration at the present time a bill of a similar purport.

A New Sugar Isolated from Mullein Root.

In addition to the glucoside in mullein root (*verbascum thapsus*), first isolated by Harlay, Bourquelot and Bridel (*Journ. pharm. chim.*), have isolated a new sugar which they have called verbascose. This sugar occurs as a light, white powder, melts at $219^\circ C$. and turns polarized light 170° to the right. On hydrolysis it yields levulose, glucose and galactose, and it therefore seems to be very nearly related to stachyose, from which it differs, however, by its melting point and its higher rotatory power.

Titration with Potassium Permanganate.

Sarkar and Dutta (*Zeit. anorg. Chem. through Journ. Soc. Chem. Ind.*) review the fact that in estimating organic substances with potassium permanganate in warm acid solution, if the temperature is too high the end point is not definite, and after the substance is entirely oxidized, separation of manganese dioxide and slow but unlimited decolorization of the permanganate solution takes place, along with the evolution of oxygen. The rate of oxygen evolution is far greater than in boiling acid solution of permanganate alone, so that some catalytic or cyclic action is probable. It is known that in a boiling solution, manganese sulphate will reduce potassium permanganate with the formation of manganese dioxide, so that some progress beyond the ordinary end point is easily explained, but the progress made even beyond the point of complete oxidation of all the manganese sulphate is still unaccounted for. Manganese dioxide itself is found to have a slight reducing action on permanganate if the solution is slightly acid, and this reduction is favored by adding more acid or by raising the temperature, that is by the conditions which favor the formation of more manganese sulphate from the dioxide and the acid. The authors therefore suggest that the course of reaction between a boiling solution of oxalic and sulphuric acids and solution of potassium permanganate is as follows: (1) $3(5 C_2H_2O_4 + 2KMnO_4 + 3H_2SO_4 = 10CO_2 + K_2SO_4 + 2MnSO_4 + 8H_2O)$; (2) $2(3MnSO_4 + 2KMnO_4 + 2H_2O = 5MnO_2 + K_2SO_4 + 2H_2SO_4)$; and (3) $2MnO_2 + 2H_2SO_4 = 2MnSO_4 + 2H_2O + O_2$, (2) and (3) being subsequently repeated as often as required, provided the supplies of sulphuric acid and permanganate are kept up. It is not advisable therefore to use potassium permanganate in acid solution for titrations at temperatures above about $81^\circ C$. Incidentally the validity of equation (2) is confirmed, the irregularities which have led to the suggestion of other equations being explained by the disturbing effects of equation (3) at high temperatures.

Fatigue a Cause of Enuresis in Children.

Nicoletopolanis (*Arch. Med. des Enfants through Brit. Med. Journ.*) concludes that one of the causes of the nocturnal incontinence of children is physical fatigue. In support of this, he cites cases in which it was observed that when the active exertions of children subject to enuresis were restrained by various circumstances, the trouble ceased. Thus a boy was found to be cured when at school, where he was less actively running about all day; but relapsed during the holidays and on those days where the usual active pastimes were indulged in. Another case had no enuresis when kept in bed for some days, but relapsed on again getting about. Other similar cases are quoted. It is thought that the deep sleep which follows physical fatigue is responsible for the involuntary micturition; and it is also suggested that the hyperacidity of the urine caused by this fatigue may be a contributing agent.

Fatal Poisoning by Mistletoe.

It has been reported that three small children were fatally poisoned at Luxora, Ariz., on Christmas by eating mistletoe berries.

Estimation of Acacia in Syrup of Acacia.

Bellier (*Ann. des Falsif.*) recommends the following method for the determination of acacia in syrup of acacia. Twenty-five c.c. (mils) of a mixture of 25 c.c. (mils) of the syrup and 25 c.c. (mils) of water are transferred to an Erlenmeyer flask and after the addition of 1 c.c. (mil) of a 10 per cent. solution of calcium chloride mixed with 40 c.c. (mils) of alcohol. The flask is then stoppered well and allowed to stand for 24 hours, rotating occasionally. After this time the clear liquid is decanted, and the sediment in the flask shaken well with 65 per cent. alcohol and thrown on a tared filter. The precipitate is first washed with 65 per cent. alcohol, then with strong alcohol and after drying to constant weight, weighed. The acacia, thus recovered, is free from sugar and contains only 3.6 to 4.2 per cent. of ash.

Vichy Salt.

Natural Vichy salt is prepared by evaporating the water of the springs at Vichy and the neighboring country to such a consistence that the salts easily crystallize out from the liquid on cooling. The salts are then collected, dried at the air temperature and exposed to an atmosphere of carbon dioxide by which the carbonates are converted into bicarbonates. Wal-lat (*Journ. pharm. chim.*) has found that the natural Vichy salt invariably contains lithia, although at times in only spectroscopically small quantities, by which it can easily be distinguished from the artificial salt prepared according to the Codex.

Van Bysterveld Medicine Company.

The Van Bysterveld Medicine Company, of Grand Rapids, Mich., is discussed in the pharmacology department of the *Journal of the American Medical Association*. The concern dealt with advertises that it will "locate the cause of your aches and pains" free. All that is necessary is that a small sample of urine be sent to the company and the free diagnosis will be forthcoming. The Van Bysterveld concern claims to have a "secret process" of uranalysis that has been "handed down generation after generation and most carefully guarded by the old families of Europe." To test the genuineness of the claims and the work of the company five individuals sent in what were purported to be "specimens" for examination. In three of the cases the samples sent were a mixture of hydrant water, anilin dye and traces of ammonia and pepsin; in the other two the samples were a mixture of hydrant water and 5 per cent. of glucose. In no two cases were the diagnoses alike and in no case was the presence of sugar mentioned.

Another Consumption Cure Fake.

The *Journal of the American Medical Association* calls attention to another consumption "cure," advertised by a company under the corporate name of J. Lawrence Hill, A.M., M.D., Jackson, Mich. In the advertisements, says the *Journal*, a cure of consumption is promised and a sample package sent on request and the receipt of twenty cents. This is followed up in the usual way by letters, symptom blanks, etc., and if the victim sought is inclined to balk, the fees are reduced from \$10 down to \$5 and later to \$3.25 before he is altogether given up. The

"treatment" consists in the administration of "globules," "plasma," "systemic wafers," "ozonol," and "laxative tablets," which were examined in the association's laboratory. The globules gave traces of iron, quinine and strychnine, with guaiac; the "systemic wafers" were concluded to be essentially milk sugar; the "plasma," stearic acid ointment with oil of wintergreen, etc.; while the ozonol seems to be a mixture of aromatic oils resembling sassafras, peppermint and eucalyptus. The drugs will not cure consumption in any stage, but they might upset the digestion of the person taking them. Testimonials are employed as usual. Four clergymen whose names were used as character witnesses denounce this use of their names as supporting the claims of J. Lawrence Hill and have demanded its discontinuance. Advertising doctors also furnish a portion of the testimonials. Some of the testimonials from alleged cured patients have been looked up and their unreliability exposed in the article. Hill is a graduate of the Chicago Homeopathic Medical College, 1894, but in his advertisements he claims to have graduated from Edinburgh University. Inquiries made of the authorities of the University of Edinburgh, says the *Journal*, brought the reply that there was no record of his graduation there, the only appearances of his name being in the matriculation records for 1877-8 and 1878-9.

Fruitola.

An alleged gallstone "cure" marketed under the name of "fruitola" is the subject of a note in the *Journal of the American Medical Association*. The preparation is described as consisting of an eight-ounce bottle of oil and six powders, four of the latter being in blue papers and two in white. The directions on the bottle tell the patient to dissolve the contents of two blue papers and one white paper in a glass of water and drink it about 3 p. m. At bedtime the entire contents of the bottle are to be taken and early the next morning the contents of the remaining papers are to be dissolved and drunk. The following instructions are given: "When the medicine operates use a vessel partly filled with water, pour in more water or stir the contents, and the gallstones will float on top in the shape of dark green lumps, varying in size from a pin head to a hickory nut, in bad cases even larger." The *Journal* says, these "dark green lumps" are nothing but the soapy concretions that usually are passed when massive doses of oil are taken. The nostrum was analyzed in the association's laboratory and from the results it was concluded that the oil was nothing more than olive oil flavored with a trace of anise, while the powders were the ordinary seidlitz powders.

Salvarsan.

The preparation known as "606" is to be made at one factory, it is said, and under the personal supervision of Prof. Ehrlich; and the name, as was reported in the CIRCULAR for last December, will be "salvarsan." The indications from various reports are that the results from the use of this remedy are not as certain as was at first expected; much danger attends its use, among other risks being the possibility of destruction of sight; and the situation is still experimental.

The Modern Materia Medica.

Antirachit is said to be a mixture of bismuth, calcium and magnesium salts with milk sugar.

Antirheumal, exploited as a liniment for rheumatism, is said to be a solution of salicylic acid glycerin ester in glycerin and alcohol.

Antodyne is said to be phenoxypropanediol which is obtained by treating phenoxypropanoxide with water under pressure. It occurs as white needles which are easily soluble in water and in the usual organic solvents. It is exploited as an anodyne.

Cibrola contains glycerophosphates and casein.

Dentaesthin, a local anesthetic, put forward for use in dental surgery, is said to consist of cocaine hydrochloride, novocaine and synthetic suprarenin in physiological salt solution.

Empyrol is the name for a mixture used for preparing tar-baths. It contains juniper tar and an organic potassium salt.

Episan-Berendsdorf is the name for tablets exploited for the treatment of epilepsy. They are said to contain bromides, zinc valerianate and borax.

Ergoval is a proprietary name for a liquid extract of ergot.

Famel syrup, a French preparation, is said to contain "lacto-creosote," calcium phosphate, codeine, aconite and other constituents.

Ferrogen is an iron-manganese preparation with peptone.

Fortonal Tablets is an iron-lecithin preparation.

Galactenzyme is the name for tablets consisting of compressed bacillus bulgaricus.

Glacial, a local anesthetic, is a mixture of methyl chloride and ethyl chloride.

Herbacol is a calcium-iron syrup, containing also potassium sulphoguaiaacolate.

Iodgomenol is a mixture of niauli oil and tincture of iodine. It is intended as an antiseptic for wounds, is said to have a strong bactericidal power and to be more stable than tincture of iodine.

Katherdercreme is a solution of sodium oleate in glycerin.

Kystoskopcreme is a mixture of glycerin and tragacanth.

Maltocol is said to contain potassium sulphoguaiaacolate, sodium camphorate, cinnamic acid, malt syrup and sodium glycerophosphate.

Nenndorfer Antiseptic Mouth-Water, recommended for the treatment of inflammation of the mucous membranes of the mouth, contains cresol and menthol.

Neopyrenol is a "soluble form of thymol," containing also benzoin and sodium benzoate.

Nesain is an arsenic-protein containing 10 per cent. of arsenic.

Neucleogen contains iron "combined with nucleic acid," phosphorus and arsenic as methylarsenic acid.

Neuralgen, exploited, as the name indicates, for treatment of neuralgia, is said to consist of the oils of mustard, lavender, peppermint, cloves, lemon, mace, and valerian, camphor, menthol, alcohol, and chloroform.

Novo-Dentaesthin, a local anesthetic for dental use, is said to consist of eucaine lactate, novocaine and synthetic suprarenin in physiological salt solution.

Pellotinum Hydrochloricum, an alkaloid from anhalonium williamsi, has been recommended as a hypnotic. It occurs as colorless prisms, which are easily soluble in water.

Peppermint-Lysoform, a dental antiseptic, is lysoform flavored with oil of peppermint.

Pyonin is prepared by fusing together sulphur and sugar, dissolving the molten mass in water and boiling the solution with calcined soda.

Pyrogen is the name for sized cotton, saturated with the tinctures of benzoin and capsicum.

Reso-Salyl, a French preparation, recommended as an antiseptic and cicatrizant, is said to contain the salicylic acid ester of ethyl-resorcin, boric acid, borax, sodium benzoate, benzoic acid, camphor, terpin (?) and chloral hydrate.

Rhinoculin is a combination of adrenalin and subcutin, a salt (phenolsulphonate) of anesthesine.

Risin Ointment contains eucalyptol, menthol, anesthesin and adrenalin, incorporated into a sterile ointment base.

Subacetal is a mixture of lead subacetate and alum, designed for the extemporaneous preparation of aluminum acetate.

Syrofig is the name for a "syrup of figs" of German preparation.

Tampoids is the name of tampons, containing as fillers, iodine, heroine, ichthyol, etc.

Thermosine-Larochette is cotton, colored orange, and saturated with various substances.

Tribromopyrocatechin is a compound of bromine and pyrocatechin. It is exploited as an antiseptic.

Trigemine is a combination of pyramidon and butyl-chloral hydrate. It is a powerful analgesic.

Tyramin, the hydrochloride of p-hydroxyethylphenylamine occurs as a white crystalline powder. It reduces blood pressure.

Ungentum Duret is said to be prepared by heating together precipitated sulphur, coal-tar, and wool fat and incorporating into this mixture camphor, chaulmoogra oil and yellow petrolatum.

Ulcerine, an ointment exploited for the treatment of inflammation of the skin produced by radium rays and also of torpid ulcers, contains according to Gastan the extracts of populus nigra, populus balsamifera and populus tremulantis and the aqueous extracts of belladonna, henbane, solanum nigrum, and poppy, with peru balsam and lard.

"Honey and Flowers."

The hair preparation known as "honey and flowers" is made as follows:

Honey	10 grammes.
Handkerchief extract.....	10 c.c. (mils).
Almond oil, expressed.....	40 c.c. (mils).
Lime water.....	80 c.c. (mils).

Dissolve the honey in the lime water. Triturate the perfume with the oil; add the honey solution, and make an emulsion.

Just why anyone should want to put honey on his head, especially in fly time, it is hard to say.

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Aqueous Liquids in Capsules.—S. R., New York, writes: "Will you kindly discuss the following prescription:

R Syr. ferri iodid. ℥ v.
Liq. Donovan. ℥ i.

M. d. t. d. No. xxiv in capsules.

"Would you dispense it in liquid form, put in the capsules or mass it with some powder (such as althea)?"

We should not dispense these liquids as such in capsules because their aqueous nature would soon cause the dissolution of the gelatin containers. Shellac-coated capsules, which might be suggested, are not soluble in the gastric fluids, but would require the alkaline secretions of the intestines to dissolve them. Some of the "waterproof" (cellulose) capsules are slightly soluble in the intestinal fluids, but their use for the administration of medicine is not advisable.

As a first suggestion we should say, mass the liquids with an absorbent powder, as kieselguhr, but not with a vegetable powder.

Or, secondly, the capsules might be made with an equivalent of freshly prepared saccharated ferrous iodide, arsenous iodide, and red mercuric iodide.

As a third suggestion we offer the following compromise formula, which may prove even more practicable than either of the others:

Syrup of ferrous iodide. 125 minims.
Arsenous iodide. ¼ grain
Red mercuric iodide. ¼ grain.
Kieselguhr. enough to make a mass.

Mix; divide in 25 parts; and dispense 24 of them in capsules.

That Iron-Acid-Alkaloid Prescription.—W. E. B., Maine, wants to know whether he would be justified in clarifying a compound of iron pyrophosphate, phosphoric acid, and alkaloids by filtering out the precipitate which gives to the mixture the appearance of a pale pea-green kalsomine. These are the ingredients of the troublesome mixture:

Iron pyrophosphate. 1 dram.
Quinine sulphate. ½ dram.
Strychnine sulphate. ¼ grain.
Diluted phosphoric acid. 2 drams.
Water. enough to make 4 ounces.

To the filtration suggestion we must offer a gentle but firm "no." Better far to leave out the acid and the alkaloids in the first place; it is less expensive and the resulting medicament has greater therapeutic worth. The filtering of an incompatible prescription mixture is not to be sanctioned unless directed by the physician—even then it were better to call the attention of the prescriber to the nature of the precipitate in mixtures like the one under consideration.

Combinations of the scale salts of iron with phos-

phoric acid and usually with a quinine salt are among the most frequent examples of incompatibility met at the prescription counter. If no alkaloids are present a satisfactory mixture can be made by using the meta variety of phosphoric acid instead of the official ortho-phosphoric. When a quinine salt is present the trouble is not so easily obviated, and, as each new combination requires a practically different treatment, it is generally the safer plan to confer with the physician before compounding the mixture. This is particularly true with regard to mixtures containing strychnine, on account of the danger of an excessive quantity of this alkaloid being taken in the last dose. It is usually possible to get the prescriber to accept a modification of the prescribed remedy when it is pointed out to him that by so doing the patient will come nearer to getting what the prescriber wants him to have.

It is possible to produce a clear mixture of the drugs called for in the prescription by W. E. B., and that with but a very slight modification (if indeed any) of its therapeutic nature. This is accomplished in the following manner:

Dissolve the alkaloidal salts in the diluted acid, and dilute this solution with an equal quantity of water. Dissolve the iron salt in about 1½ ounces of water with the aid of a gentle heat, and mix this with a solution of 2 drams of sodium chloride in 1 ounce of water. Dilute the iron solution to 3 ounces; add the alkaloidal solution a few drops at a time, stirring the mixture vigorously; heat the solution gently for a few moments; add enough water to make 4 ounces, and dispense in an amber-colored bottle. The patient should be cautioned to return the mixture if any precipitate is deposited.

New York Board Questions.—A. K., New York. —We have not a complete collection of sets of examination questions used by the New York Board of Pharmacy during the last few years. Perhaps the secretary of the board, Warren L. Bradt, of Albany, has such a collection. However, from time to time, we have printed sets of questions asked by this board, as you may see by referring to the issues of the CIRCULAR for July, 1904, page 157; January, 1905, page 21; April, 1906, page 138; March, 1907, page 274; January, 1908, page 30; January, 1909, page 28; December, 1909, page 642; and October, 1910, page 519.

The CIRCULAR is on file at the Astor and some of the other public libraries and also at the libraries of the colleges of pharmacy.

Concentrated Essence of Bay Rum.—W. S., Connecticut.—Bay rum is a solution of oils in alcohol, diluted with water. By dissolving the desired oils in a small quantity of alcohol, one may make a product which he would be justified in calling a concentrated essence of bay rum. The directions for making bay rum of this should be to dissolve it in as much alcohol as was omitted in the first place from the quantity called for by the formula, previously mixed with the necessary amount of water.

A formula for spirit of myrcia was given in the Pharmacopœia of 1900, and a formula for a preparation which is offered as an improvement on the formerly official one, appears on page 82 of this issue.

Fenner's Tincture.—F. M. D., South Carolina, writes for a formula for Fenner's tincture, which he saw in the CIRCULAR not less than forty years ago, and maybe back of that.

The formula he alludes to is to be found in the issue for January, 1859, page 8, and is the same as the one given in the National Formulary under "Antacrid Tincture," a synonym for which is "Fenner's guaiac mixture."

The article in the old number of the CIRCULAR referred to is credited to Dr. Fenner, of New Orleans, in the *Virginia Medical Journal*. The author says he received the formula from his brother, Dr. Robert Fenner, of Jackson, Tenn., who said that it was not to be found in any medical book of the day, but had been learned by him from their father, who, in turn, had found it in an old English work, then out of print, by a Dr. Falk, of London. The latter author called the mixture by a name under which it is at present official "tinctura antacrida." Dr. Fenner, of New Orleans, stated that he had recently accidentally discovered the same formula in Ellis' Medical Formulary. By referring to that work (ninth edition, 1849, page 172), we find the formula under the general head "Sialagogues," and under the specific name, "Antacrid Tincture."

It is now in order for some medicine faker to have this preparation put up in a fancy package and rechristened with a fancy name, and then say that the American Pharmaceutical Association is teaching substitution by giving its formula in the National Formulary, or for the American Pharmaceutical Association, by virtue of its copyright on that book, to claim to have the right to prohibit the reprinting of the formula in the journals, formularies or textbooks.

Calculating Parts in Thousands.—R. E. A., Ohio, sends three prescriptions for aqueous solutions containing 1 part of a solid in 10,000, 20,000, and 50,000 parts, respectively, the prescriptions to be filled by adding a 1-in-1000 solution of the solid to water. He states how much of the stock solution and how much water he used in each instance, and asks if the proportions are right.

In diluting a 1-in-1000 solution of a salt to make a 1-in-10,000 solution; it is evident that 1000 parts of the stock solution (containing 1 part of the salt) added to 9000 parts of water, will make 10,000 parts of the diluted solution containing 1 part of the salt, or, 1 part to 9, to make 10. The prescription called for 1 ounce of the diluted solution. If 1 ounce is 10 parts, then 1 part is 1/10 of 1 ounce and 9 parts is 9/10 of 1 ounce. An ounce being 480 minims, 1/10 of 1 ounce is 48 minims, and 9/10 of 1 ounce is 432 minims. By adding 48 to 432 we got 480, by way of proof of the correctness of the work.

In the same way, to make a 1-in-20,000 solution by diluting a 1-in-1000 solution of a salt, 19,000 parts of water must be added to 1000 parts of the solution. This gives us 20,000 parts in all, in which there is evidently 1 part of the salt. In the case in question, 2 ounces of this diluted solution is wanted. For short, instead of saying 1000, 19,000, and 20,000, we may, without affecting the proportions in the least, say 1, 19, and 20. Then 20 parts is 2 ounces, and 1 part is 1/20 of 2 ounces, or 2/20 of 1 ounce, or 1/10 of 1 ounce, or 48 minims; while 19 parts is 19/20 of 2 ounces, or 19/10 of 1 ounce, or 912 minims, which

equals 1 ounce, 7 drams, and 12 minims. For verification, add to this latter quantity 48 minims, which gives us 2 ounces.

To make the 1-in-50,000 solution, add 1000 parts of the stock solution to 49,000 parts of water, making 50,000 parts of the desired solution; or, for short, add 1 part to 49 parts, making 50 parts. Of this solution 3 ounces is required. If 50 parts is 3 ounces, then 1 part is 1/50 of 3 ounces or 3/50 of 1 ounce. An ounce being 480 minims, 3/50 of an ounce is 3/50 of 480 minims, or 28.8 minims; and 49 parts is 49/50 of 3 ounces, or 147/50 of 1 ounce, which is 1411.2 minims, and this is equal to 2 ounces, 7 minims, and 31.2 minims. To this add the 28.8 minims, and we have 3 ounces.

We see no reason why more than the desired quantity should be made and a portion thrown away, when it is just as easy to make the exact quantity: we need not take into consideration fractions of a minim.

The work of our querist is correct, except for one clerical error, which does not affect his results.

Stable Solution of Magnesium Citrate.—G. P. D., Massachusetts.—We do not know whether or not the "large manufacturers" depart in any manner from the official formula and process in preparing a solution of magnesium citrate that will keep "more than a reasonable time." If they use a different formula or add a preservative they are required by the federal pure drugs act and the laws of most States so to state on the labels; and in some States the sale of such modified preparations under the official name is absolutely prohibited.

In a paper read at the Richmond meeting of the American Pharmaceutical Association J. K. Thum, of Philadelphia, stated that he considered the question of the deterioration of this preparation to be a bacteriological one, and offered the following suggestion for its solution:

It has been our custom for some time to sterilize our solution of magnesium citrate in the manner described below, and we are firmly convinced that it is the only legitimate and practical way of obtaining a satisfactory preparation from every standpoint. Special or elaborate apparatus is not needed for any work of this kind the pharmacist may want to do in his laboratory or behind his prescription counter.

Ordinary citrate bottles with washer stoppers are used. They are thoroughly cleansed, inside and out, filled completely with water, placed in a deep agate kettle and the stoppers allowed to hang at the sides of the bottles so as to insure their being immersed in the boiling water; the kettle is then covered and boiling carried on for thirty minutes. (We have observed that boiling for fifteen minutes is ample when every attention is paid to detail.) At the end of that time the bottles should be emptied and immediately stoppered. In the meantime the solution is prepared and filtered; each bottle is then filled, allowing, of course, enough space for expansion of the solution due to heat [and allowed to remain unstoppered, of course]. The bottles are now replaced in the kettle and it is filled with water, taking care not to have the water come too near to the mouth of the bottle; if this precaution is not taken the water will, in the process of ebullition, dilute the solution. Boiling is then carried on for thirty minutes, the bottles immediately stoppered, labeled, and stored away until needed for dispensing, when the requisite amount of potassium bicarbonate is added.

In the CIRCULAR for January, 1909, page 24, R. P. Daniel, of Texas, outlined a similar process which enabled him to keep the solution for upwards of two months, and in earlier issues much has been said on the subject.

Smelling Salts.—A. P., New York.—Some salt of ammonia being the base of most smelling salts, the perfumes for such preparations should be such as harmonize with the ammoniacal odor; these, according to Askinson, are oils of the rose, nutmeg or cinnamon class. The first two formulas here given are adaptations of two by this authority:

I.	
Ammonium carbonate.....	2 pounds.
Stronger ammonia water.....	1 pound.
Oil of bergamot.....	15 grains.
Oil of lavender.....	15 grains.
Oil of nutmeg.....	8 grains.
Oil of clove.....	8 grains.
Oil of rose.....	8 grains.
Oil of cinnamon.....	75 grains.

In a large porcelain jar mix the two ammonia derivatives; cover, and set aside. After some days the mixture will have changed into a firm mass of ammonium mono-carbonate, which should be reduced to a coarse powder; after which the oils, mixed, are to be rubbed in a mortar with about a tenth of the salt. The perfumed portion is then triturated with the other nine-tenths until the odor is equally distributed.

Preston Salt.

Mix finely powdered ammonium chloride with freshly slaked lime, and perfume as desired. The mixture continually develops small amounts of ammonia for a period extending over several years.

Snively, in his *Manufacture of Perfumes*, gives the following recipe:

Ammonium chloride.....	3½ troy ozs.
Potassium carbonate.....	4½ troy ozs.
Oil of lavender.....	½ fl. oz.
Oil of lemon.....	3 fl. drams.
Oil of bergamot.....	1 fl. dram.
Oil of clove.....	15 minims.
Ammonia water.....	enough.

Triturate the salts together, add the oils, and moisten slightly with ammonia water.

Liquid Rouge.—W. F., Pennsylvania.—We do not know the composition of the proprietary article you mention, but in the *CIRCULAR* for September, 1910, page 474, appear two formulas for liquid rouges, and here is another:

Ammonia water.....	2 ounces.
Carmine ("No. 40").....	1¼ ounces.
Triple extract of rose.....	2½ ounces.
Rose water.....	4 pints.

Reduce the carmine to powder, macerate it in the ammonia water for several days, add the other ingredients, and let the whole stand for a week, agitating frequently. At the end of that time allow the mixture to stand until the liquid becomes quite clear, when it is to be siphoned into small bottles for sale.

Face Powder in the Form of Cakes.—W. F., Pennsylvania.—As recently as in the *CIRCULAR* for October, 1910, page 518, we stated that any face powder may be made into cakes or blocks by adding to the powder from 6 to 8 per cent. of acacia, triturating the whole thoroughly and making it into a stiff doughy mass by incorporating water in small portions. This mass is cut or molded into the desired form and dried at ordinary temperature.

Herpicide.—J. L. C., Massachusetts.—We do not know the composition of this article. In the *CIRCULAR* for April, 1906, appears a communication from a reader who states that the following is "said to be the exact formula for this preparation:"

Boric acid.....	4 ounces.
Resorcinol.....	320 grains.
Salicylic acid.....	2 ounces.
Glycerin.....	2 fl. ozs.
Alcohol.....	4 pints.
Tincture of saffron (20%).....	192 minims.
Oil of bergamot.....	192 minims.
Oil of lemon.....	4 drams.
Water.....	enough to make 1 gallon.

In the *Sanitary Bulletin* of the New Hampshire Board of Health for April, 1907, appears an article entitled "Examination of Toilet and Other Preparations," which is reprinted in the *CIRCULAR* for September, 1907, page 589. From this article we quote:

Newbro's Herpicide.—Herpicide Company, Detroit, Mich. Leaves 2.5 per cent. of residue on evaporation, about 1 per cent. of which is salicylic acid, with some borax or boric acid. Shows no alkaloids or vesicants. Contains 56.2 per cent. of alcohol, practically all of which was found to be methyl, or wood alcohol. As a constituent of a dandruff cure, salicylic acid doubtless finds an appropriate place; the only objectionable ingredient in this preparation is the wood alcohol.

Another sample of herpicide was examined—such sample being said to represent fresh stock received since January 1st, 1907. The alcohol in this sample, amounting to 52.6 per cent., was also found to be of the methyl variety. Moreover, the package contained no statement of the percentage of alcohol, as is required by law in the case of all such preparations. So long as this product contains wood alcohol it cannot be legally sold in New Hampshire.

Perfume for a Dry Shampoo.—J. H. A., Michigan.—One can best judge of a suitable perfume for a dry shampoo by observing the tastes of his customers as indicated in their selection of handkerchief extracts, soaps, talcum powders, etc. Similarly he may arrive at the degree of odorousness that will appeal to prospective purchasers.

Despite the influx of the thousand and one "bouquets" and "blends," rose and violet continue as favorites among the scents, and their use for perfuming any toilet preparation is never ill-advised. For a rose odor, the oil alone is necessary. Some prefer the odor of a blend of oil of rose 25 parts and oil of wintergreen 1 part.

A pleasing violet may be made as follows:

Extract of cassie.....	1 ounce.
Extract of jasmine.....	½ ounce.
Solution of ionone (10%).....	¼ ounce.
Oil of orris.....	1 dram.

Among a certain portion of the human family a perfume something like the following will find favor:

Oil of lavender (aged).....	1 ounce.
Oil of cloves.....	6 drams.
Tincture of musk.....	2 drams.

Formulas for a number of synthetic odors appear in the issues of the *CIRCULAR* for November, 1910, page 574; and July, 1909, page 344.

Registration by One Board of a Licentiate of Another.—W. H. W., District of Columbia.—A query similar to yours was answered in last month's *CIRCULAR*, page 31, which had not reached you when you wrote.

More about Bay Rum.—That bay rum note of Brother Collins in the CIRCULAR for October, 1910, page 516, has stirred up more interest (see the CIRCULAR for last month, page 33) than we supposed it possible for druggists to manifest over a preparation which is generally regarded as a commonplace one. This pleases us immensely. A. G. Koehler, Missouri, now writes:

An article on page 635 of the December CIRCULAR attracted my attention as I once knew a Mr. Davies, of Pennsylvania, but as to caramel in bay rum, that is all a sad mistake. Why not add a few drops of ammonia water to a filtered product? This will give a far better color and one that will hold. I have tried both and believe mine is the better; also it leaves no color-mark on the shelf bottle on standing. I should like for Brother Davies to try the same.

Incidentally it may be mentioned that in spite of Brother Davies' prediction (in the CIRCULAR for December, 1910, page 635) Brother Collins' sample of bay rum shows no signs of throwing down any flocculent particles, but is as clear now as the day it was received several weeks ago.

From F. W. Scott, Jr., New York, comes the following:

Here is my formula for bay rum. It is particularly refreshing and approaches nearer to the imported varieties than do most of the domestic products:

Oil of bay.....	10.0 c.c. (mils).
Oil of cloves.....	2.0 c.c. (mils).
Oil of lemon.....	1.0 c.c. (mils).
Menthol.....	1.5 grammes.
Tincture of capsicum.....	8.0 c.c. (mils).
Acetic acid.....	20.0 c.c. (mils).
Alcohol.....	800.0 c.c. (mils).
Water.....	1200.0 c.c. (mils).
Purified talc.....	50.0 grammes.
Tincture of curcuma.....	enough.
Caramel color.....	enough.

Dissolve the oils and menthol in the alcohol, add the tincture of capsicum and acetic acid and incorporate the purified talc; then add the water in five or six portions, shaking after each addition. Filter. Add enough tincture of curcuma to make the filtrate a pale yellow, and then add a few drops of caramel color to give a brownish-yellow.

We want six of our readers to try this formula and report results to us. In the meantime we thank Mr. Scott for submitting it, and hope that he will send us others for different preparations, and that his example will be followed by our readers generally.

Furniture Polish.—F. G., California.—We printed nearly a whole page of formulas for all kinds of furniture cleaners and polishes in the CIRCULAR for January, 1910, page 20. One of these we reprint herewith in the hope that it, or some modification of it to be made by yourself after you have experimented, may prove to be what you wish:

Shellac.....	180 parts.
Sandarac.....	15 parts.
Mastic.....	16 parts.
Copal.....	16 parts.
Rosin.....	15 parts.
Alcohol.....	1,300 parts.

Mix, set aside in a warm place, shaking occasionally until dissolved, and filter.

Many of the anilin dyes are readily soluble in this liquid, and may be added thereto when it is desirable.

The woodwork is first carefully cleaned, and the polish is, after dilution with acetone, applied with a soft brush and rubbed down with a piece of silk.

An Acid-Resisting Ink.—W. F. G., Massachusetts, writes: "Can you furnish me with a formula for a chemical-proof ink? There seems to be a new ink which acids will not remove, especially good for writing labels, but the manufacturer of the one I have had cannot be found."

We are not familiar with the brand of ink that our correspondent has in mind, and so ask any reader who can offer any suggestion of value in this connection to do so.

In the meantime we think W. F. G. might with profit experiment with liquid india ink, which may be made by dissolving shellac in a hot aqueous solution of borax, and grinding the india ink in this. Ordinary lamp black may be used instead of india ink, but, of course, is not so good.

In this connection, too, may be found interesting and perhaps valuable the formulas below, taken from a little monograph on inks:

Hausmann's Indestructible Ink.

Mix 1 part of genuine Trinidad asphaltum with 4 parts of oil of turpentine, and color with a sufficiency of plumbago for black, or vermillion for red.

Close's Indestructible Ink.

Mix 25 grains of powdered cobalt [?] and 200 grains of oil of lavender, using a gentle heat; for black, color with 3 grains of lampblack, and 1 grain of indigo, both in fine powder; for red, with a sufficiency of vermillion.

Deodorizing Carbon Disulphide.—F. R. S., Iowa.—Perhaps the following process will be found useful to you: To 1 liter of the disulphide add 0.5 c.c. (mils) of bromine, and allow the mixture to stand three or four hours, after which remove the bromine with copper filings, or by shaking with a small excess of potassium hydroxide. Should the preparation then appear turbid, it may be cleared by shaking with a little potassium chloride, and filtering. Carbon disulphide thus purified is colorless, has no unpleasant odor, on evaporation leaves no residuum, and dissolves bromine without undergoing any chemical change.

It may be that for the purposes for which you intend to use the disulphide (of which you give us no intimation), perfuming it with some strongly aromatic oil would answer every purpose.

It should be borne in mind that carbon disulphide is a dangerous substance to handle, as not only is it very inflammable, but a mixture of its vapor with air has been known to explode at a comparatively low temperature. Bromine, too, is capable of doing considerable harm to those who handle it without proper caution, as we have abundant reason to know.

Cost of a Metric Outfit.—H., New York.—A set of metric prescription weights costs about 25 cents. A larger set, ranging up to 50 grammes, for use in the manufacturing laboratory, may be obtained for about \$2. Metric graduates cost about the same as corresponding sizes of the old-style, say \$1 for a set of three ranging from fractions of a cubic centimeter to 250 cubic centimeters. In this day when the Pharmacopœia, the National Formulary, and many prescriptions are written in the metric system, no drug store can afford to be without a set of metric weights and measures.

Eau de Quinine.—H. D. C., Indiana.—In the CIRCULAR for October, 1910, page 517, we stated that several years ago we had published the fact that Dr. Tscheppe failed to find any constituent of cinchona bark in a widely known "quinine" hair wash. As the tonic properties of the cinchona alkaloids when applied externally are believed to be entirely imaginary, their absence from a hair tonic would not detract from its value, although the drug officials doubtless require the presence of the alkaloid in any preparation bearing the magic name of "quinine hair tonic."

Numerous formulas for so-called hair tonics that do contain quinine are extant, and two were given in the issue to which we have just referred. Two more are here given, the first being attributed to Pron by the *New York Medical Journal*, and the second has been proposed for addition to the British Pharmaceutical Codex.

I.

Quinine hydrochloride.....	1 dram.
Tannic acid.....	2½ drams.
Tincture of cantharides.....	1½ ounces.
Glycerin	1½ ounces.
Eau de cologne.....	10 drams.
Vanillin	1½ grains.
Ground red saunders.....	7½ grains.
Alcohol.....	enough to make 2 pints.

Mix the several ingredients, and filter after they have stood for five days.

II

Quinine hydrochloride....	0.100 gramme.
Diluted sulphuric acid....	0.625 c.c. (mil).
Chloroform	0.500 c.c. (mil).
Alcohol	20.000 c.c. (mils).
Glycerin	1.500 c.c. (mils).
Cologne water.....	1.500 c.c. (mils).
Spirit of pimenta.....	25.000 c.c. (mils).
Tincture of cudbear.....	3.000 c.c. (mils).
Diluted rose water to make	100.000 c.c. (mils).

Dissolve the alkaloidal salt in 40 c. c. (mils) of rose water; add the acid and then the other ingredients.

Wood Flour.—J. H. A., Michigan.—Any finely sifted saw-dust will answer as the wood flour named as an ingredient in the dry shampoo formula in the CIRCULAR for October, 1909. The best sort is the boxwood saw-dust used as an absorbent by jewelers and watch-makers. This may be obtained from any dealer in jewelers' supplies. Generally it is desirable to sift the commercial article for obvious reasons.

Pazo Ointment.—E. J. C., Michigan.—The only reference we find to this preparation in any of the usual sources of information concerning such things, is in the CIRCULAR for April, 1910, page 193, where we find it stated that under the laws of Colorado it has been declared misbranded when labeled "The only perfect pile cure."

Concentrated Vinegar Essence.—C. P., New Zealand.—So-called vinegar is made by diluting acetic acid with water, in the proportion of 1 part of the acid (33 per cent.) to 4 or 5 parts of water. The resulting mixture, of course, is not vinegar and should not be sold as such.

Dental Mummifying Paste.—H. H. Brinkman, Ohio, seeing the note on this subject in the CIRCULAR for December, 1910, page 532, is kind enough to contribute the following formula:

- a. Zinc oxide..... 140 grains.
Thymol 30 grains. || Alum | 10 grains. |
| Mix thoroughly. | |
| b. Creosote. | |
| Glycerin. | |
| Formaldehyde [?]..... | equal parts. |
| Mix thoroughly. | |

For use, make a paste by kneading together the required amount of the two mixtures.

Mr. Brinkman states that he has used this paste and knows it to be good. He says that only the best materials should be employed in making it. He adds that some skill is required to place the paste properly in the root canals. Presumably by "formaldehyde" he means the official solution. In conclusion he expresses the hope that the information he has given will help some brother druggist. We commend that spirit of helpfulness, and thank Brother Brinkman for his formula, and hope that he will let us hear from him again and frequently.

Unguentine.—F. G., California.—We do not know the composition of this preparation. A few years ago we published a contributed note to the effect that it "represents alum compound (non-irritating), phenol, ichthyol, zinc oxide, aromatic and antiseptic oils, with especially prepared petrolatum and purified animal fat."

Formula for Making Chewing Gum.—S. K. K., New Jersey.—Contrary to what seems to be a widely prevalent idea, the formula for making many preparations is of secondary importance, the prime consideration in such cases as we now have in mind being the factory equipment and the ability, born of experience, to use it.

We think that an inexperienced man who has not the proper machinery can not compete successfully with established concerns in the manufacture of chewing gum. As a suggestion, however, to those who wish to experiment, we here print a few formulas:

I.

Gum chicle.....	240 parts.
White wax.....	64 parts.
Sugar	140 parts.
Glucose	128 parts.
Water	192 parts.
Balsam of peru.....	4 parts.
Flavoring	enough.

Dissolve the sugar in the water by the aid of heat and pour the mass on an oiled slab. Melt the gum, wax and balsam together and pour on top of the syrup, and work the whole together. Roll the mass out thin and cut into pieces of the desired size and shape.

II.

This one is from the *Bulletin of Pharmacy*, with some comments by the editor of that journal:

Considerable experience in manipulation is necessary to success and the published formulas can at best serve as a guide rather than as something to be

absolutely and blindly followed. Thus, if the mass is either too hard or too soft, the proportions should be changed until it is right. The following formula is offered for what it is worth:

Gum chicle.....	56 parts.
Paraffin, hard.....	15 parts.
Balsam of tolu.....	2 parts.
Balsam of peru.....	2 parts.
Sugar, granulated, fine.....	160 parts.
Glucose	64 parts.
Water.....	a sufficient quantity.

Soak the chicle in water until it absorbs all that it will take up. Melt the paraffin and balsams together and add the swelled chicle. In the meantime mix the sugar and glucose with 50 parts of water, and boil together until a little of the liquid withdrawn on the end of a stick and quickly dipped into a glass of cold water, snaps between the fingers on an attempt to bend it (what is called the "crack," or eighth degree, of candy boiling by confectioners). When this is reached, quickly remove from the fire and pour out on a large marble slab, the surface of which has been previously greased with butter or good sweet oil. As soon as the syrup is spread, add to it, a little at a time, carefully working in, the melted mixture of gums, paraffin, etc., until a portion of the mixture tested is found to have the proper degree of toughness. The flavoring (which consists of the essential oils, such as wintergreen, cinnamon, clove, sandalwood, etc., or any other substance that you may desire) should be well incorporated with the paraffin and gum mixture before adding to the syrup. These are the methods of procedure, and read easily enough, but you will find that it will pay you to employ an expert confectioner to carry them out. Sugar boiling, the carrying it to just the right degree, is an art in itself. You will need a large, smooth slab of marble, several inches thick, on which to do the mixing.

Other notes on this subject appear in the issues of the CIRCULAR for June, 1907, page 416; September, 1905, page 317; December, 1905, page 434; June, 1904, page 133; and in still earlier issues.

Duffy's Malt Whisky.—"Southron," Texas, asks two questions. One is, "Have the proprietors of Duffy's malt whisky changed the formula of Duffy's malt whisky since the food and drugs act went into effect?" Answer: They have.

The other question is, "If so, was it due to any decision of the food commissioners?" Answer: Each reader is at liberty to draw his own inference.

"Southron" also requests a report of an analysis of the preparation in which it was stated that it contained sugar. We do not know just which analysis he means, but we have seen a report to the effect that the "whisky" in question was essentially diluted alcohol, sweetened. The manufacturers now state that they have discontinued the use of simple syrup in this product.

Green Salve.—Referring to the note on this preparation in the CIRCULAR for December, 1910, page 631, Otto Raubenheimer, New York, writes:

Having some calls for grüne salbe from German and Jewish customers, I beg to inform you that I dispense beladonna ointment, as they generally want it for hemorrhoids.

An Absorbable Ointment Base.—F. R. S., Iowa.—The casein creams are not absorbable. The so-called vanishing creams are super-fatted stearate soaps with a base of sodium, potassium, or ammonium. A typical formula is the following:

Stearic acid.....	2½ ounces.
Sodium carbonate.....	3 drams.
Cacao butter.....	½ ounce.
Glycerin	2 drams.
Perfume	as desired.
Distilled water.....	to make 20 ounces.

Place the stearic acid and the cacao butter in a suitable vessel on a water bath and when it has melted add the sodium carbonate and the glycerin dissolved in 2 ounces of water. Heat with constant stirring until effervescence ceases, remove from the heat, add the rest of the water; stir with a glass rod until smooth; and beat to a fluffy mass.

A smoother cream results from the use of an equivalent quantity of stronger ammonia water to replace the sodium carbonate.

We are not satisfied that such an ointment base will prove practicable for your purpose. If not, you might experiment with a mixture of various fats, somewhat as follows:

Purified lard.....	4 ounces.
Coconut oil.....	4 ounces.
Mutton suet.....	4 ounces.
Oil of pimento.....	2 drams.

Melt the fats together at a gentle heat and stir until cold. Beat in the oil of pimento, which is added as a preservative; it may be omitted if the finished product is to contain salicylic acid.

The following formula, which has been suggested for introduction into the British Pharmaceutical Codex, is for an ointment with a base of the kind we have in mind:

Analgesic Ointment.

Methyl salicylate.....	50.0 grammes.
Menthol	10.0 grammes.
Stearic acid.....	8.0 grammes.
Sodium carbonate.....	1.2 grammes.
Glycerin	1.2 grammes.
Distilled water enough to make	100.0 grammes.

Melt the stearic acid on a water-bath, add the sodium carbonate and glycerin, previously dissolved in 4 c.c. (mils) of hot distilled water, continue the application of heat for an hour, with constant stirring, and make up the weight to 40 grammes with distilled water; then pour the mixture into a mortar, and add all at once the methyl salicylate, in which the menthol has been dissolved; stir until smooth, and transfer to collapsible tubes.

Lime Water.—Commenting on the note on this liquid, with illustration of apparatus for keeping it uncontaminated, which appears in the CIRCULAR for last month, page 22, Otto Raubenheimer, New York, calls attention to the fact that he has been using such an apparatus for eight or ten years, as set forth in a paper presented by him at the 1907 meeting of the American Pharmaceutical Association. This paper appears in the Proceedings for that year, page 179. Mr. Raubenheimer emphasizes the necessity for using U. S. P. lime and distilled water in making lime water. He does not endorse the practice of giving away this preparation, said to be indulged in by some druggists.

Rubber Tips.—F. W. Scott, Jr., New York, favors us with the following "tips" which are of interest and should prove of value:

"Here are two or three little suggestions that may help to lessen the aggravations and exasperations of Brother Druggist who sometimes thinks things not altogether in accord with his mild voice, cheery smile, and generally pleasing manner.

"When selling rubber ice bags, advise the customer to put the cracked ice in a basin of cold water for a minute before putting it into the bag. This takes off the sharp edges which otherwise might cut the rubber and shorten the life of the bag.

"Rubber hot water bottles should be filled only to half or three-quarters of their capacity, the sides of the bag being compressed until the water appears at the mouth, when the stopper is to be inserted and screwed tight. The air being thus removed, the rubber does not have to bear nearly the amount of strain it would otherwise have to sustain, and there is much more comfort for the patient using it. It is soft and pliable and conforms to the shape of that part of the body to which it is applied instead of being hard like a foot ball or punching bag.

"It is often necessary to attach new hard rubber screw fittings to syringes, stethoscopes, etc. But nine times out of ten the threads differ. A little force is used and bing! your fitting has a pretty little crack in it. Try boiling the fitting in water for two or three minutes. The hard rubber softens, after which the rest is easy, and you have done a neat little job.

"When making connections with soft rubber tubing stick the ends in boiling water for a few minutes and see how much further they will stretch."

If there were more observing pharmacists who communicated their observations to the press for the benefit of brother druggists, the "cheery smile" would grow broader and the "generally pleasing manner" would be more so. And this improvement would affect the man who sent the good stuff as much as the one who read it, as knowledge of a good deed accomplished by him makes a man's gastric juice flow more freely, aids digestion, chases worry and tends to help the general uplift. We believe that Mr. Scott is happier and in a generally more benevolent frame of mind for having sent us these "rubber tips," and while thanking him for them, we point to him as a shining example which we hope many others will emulate.

Mendel's Solution.—H. M. K., New York.—We are not familiar with a preparation of this name, but as you think that the solution about which you inquire is an iodine combination, we suspect that what you want is *Mandel's solution*, which consists of—

Iodine	10 grains.
Phenol	4 grains.
Potassium iodide.....	20 grains.
Glycerin	1 ounce.

Prof. L. B. Mendel, of Yale, and Prof. John A. Mandel, of Bellevue, each informs us that he has never suggested a solution of this sort.

Father John's Medicine.—C. B., New York.—We do not know the composition of this preparation, but have heard that it is a sort of an emulsion of cod liver oil.

Dyeing Natural Flowers.—E. J. G., Pennsylvania.—Successfully to dye cut flowers by immersing the stems in a solution of a dyestuff, these three things are essential: First, the dyestuff must be one that is freely soluble in water and is deposited in a finely divided state on the evaporation of the solvent; second, the solution must be a concentrated one; and third, the operation must be carried on in a warm dry room so as to facilitate the evaporation of the plant moisture.

The most important of these essentials is the one first named. Color merchants tell us that the best dyes are the anilins known as basic colors and those known as acid colors. Specific dyestuffs are acid green G G, for green; rhodamine, for pink; and auramine, for yellow.

Several years ago an inquiry as to coloring carnations green, a "fad" which has several times appeared in this city, attracted the attention of S. W. Williams, who undertook some experiments in regard to it. The substance of a report made by him to us follows:

Acid wool green B will answer the purpose. If the stalks of white carnations are allowed to stand for a few hours in a solution of this dye, the color is readily taken into the circulation, following the veining of the petals and producing a beautiful effect. Any depth of color from the faintest tint to a brilliant green may be obtained by varying the strength of the solution. A comparatively strong solution usually has the effect of giving a rich green border to the petals, with a more delicate tracing of the veining toward the center of the flower. Dilute solutions give a more natural effect. Naphthol green B acts slowly, but gives a very pretty tint.

There are very likely many other green dyes which will answer the purpose, and perhaps better; but the writer tried malachite green, direct green and a number of others with negative results. An acid yellow worked with indigo carmine may be made to produce colors ranging through apple to the more yellow greens, while the same blue used in connection with the wool green should give bluish greens.

Of the many dyes tried by the writer but about one in five were taken into the circulation of the plant. One theory to account for this is that basic dyes may be intercepted by tannins or other incompatible principles in the stalk, whereas acid colors may be allowed to pass on to the flower. As a number of acid dyes failed, however, to enter the circulation, the writer would seek to offer no explanation without further study. It is strange also that, of several flowers of the same kind placed in the same solution, some appropriated the color much better than others. One theory for this is that a flower not fully opened would naturally draw up the solution more readily than another which had more completely matured. The writer's experiments, however, have not proved this to be necessarily so, nearly full-blown flowers seeming to act about as well as any.

As to the comparative lasting qualities of flowers thus treated, some seem even superior in this respect to those not dyed.

Crocein scarlet, in rather dilute solution, will readily change a white Alaska or Harrison white into a beautiful pink carnation much resembling the "day-break," the veining of the perianth being, however, more marked in the dyed samples. This dye will pass four or five joints in the stem and color the flowers

pink within an hour, acting far more rapidly than most of the other colors.

Cyanole, extra, works satisfactorily where a blue tint is desired.

There seems to be no reason to doubt that any flowers with herbaceous stems would be susceptible to the same treatment as carnations. Those with woody stems would probably be less absorptive; but experiment in this line is so easy that those interested may well undertake it.

We should like to hear from E. J. G. and others as to what success attends their experiments along the lines herein suggested.

As to Morphine in Opium.—F. G. E., New York, whose two queries as to whether a sale of opium was necessarily a sale of morphine are answered in the issues of the CIRCULAR for last month, page 30, and the month before, page 633, now writes:

I am sorry that I have no extensive library of recent date or I should not have taken such a circuit so as to obtain the required information about that morphine law in order to keep it, for you cannot always tell by looking at a cat how far that cat can jump. When I was a boy I was taught by the late Rawdon Macnamara, of Dublin, to guard against considering every product of opium resulting from the action upon it of chemical reagents to be a distinct principle originally existing in the same proportion as so much sand would be in the opium examined. From recent views on the subject I certainly don't feel like a man that has been run over by a steam roller. Thanking you for your courtesy, etc.

Tedford's Cold Cream.—N. M. P., Missouri.—It is impossible for us to say just exactly what process is used by any specified manufacturer in making his cold cream. We have printed dozens of formulas for preparations of this class, in which all types were represented. Consult your annual indexes, and if you need help on any particular part of the formula or process which you select as being the one most likely to enable you to make the kind of cream you want, let us know and we shall see what we can do for you. We do not know what Tedford's cold cream is like, as it probably has small sale, if any, in the East, and so do not know what more to suggest to you just now.

Therox.—Charles Minarcik, Jr., New York, seeing the inquiry of "Thymol," Ohio, in last month's CIRCULAR, page 28, is kind enough to write that he has examined this preparation and has come to the conclusion that it is nothing more than perfumed borax.

We thank Mr. Minarcik for his interest and trust that he will let us hear from him again.

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Stomach Rite.—"Simplex," New Jersey.

Albucol; where may it be obtained.—E. M. C., Missouri.

Orange Manna.—C. W., Colorado.

Alternating Current Rectifier, and plates to be used in connection with the same, to change an alternating current of electricity to a direct current.—M. S., Illinois.

Mitchell's Magic Lotion.—F. G., California.

Woofter's Corn Remedy.—J. L. C., Massachusetts.

Caementium.—E. J. C., Michigan.

Booth's Mi-o-na.—E. J. C., Michigan.

Pazo Ointment.—E. J. C., Michigan.

Two New Dermatological Ointments.

The following are given in the *American Journal of Dermatology* as popular prescriptions in dermatologic practice:

Compound Pyrogallol Ointment.

Pyrogallol	5 grammes.
Ichthyol	5 grammes.
Salicylic acid.....	2 grammes.
Petrolatum	88 grammes.

Compound Chrysarobin Ointment.

Chrysarobin	5 grammes.
Ichthyol	5 grammes.
Salicylic acid.....	2 grammes.
Petrolatum	88 grammes.

Wool-Fat Cold Cream.

Hydrous wool-fat.....	12 ounces.
White wax.....	4 ounces.
Spermaceti	4 ounces.
Expressed oil of almonds.....	28 ounces.
Borax	144 grains.
Distilled water.....	19 ounces.
Oil of pimento.....	5 minims.
Oil of rose.....	20 minims.

Melt together the wax, spermaceti, and almond oil on a water-bath; incorporate this mixture with the wool-fat in a warm mortar and stir until almost cool. Gradually beat in the water in which the borax has been dissolved; beat well with an egg-whip, adding the perfume.

Almond Bleaching Cream.

The formula given below is from the *National Druggist*:

Hydrogen dioxide solution.....	4 ounces.
Glycerin	3½ ounces.
Powdered borax.....	2 drams.
Expressed oil of almond.....	2½ ounces.
Hydrous wool-fat.....	8 ounces.

Triturate the hydrous wool-fat and the almond oil until well mixed. Incorporate with this the borax dissolved in the glycerin and the hydrogen dioxide solution. Any perfume desired may be added. We suggest 40 minims of oil of rose geranium to the pound.

To Remove the Odor of Iodoform.

Minton (*Bull. Pharm.*) says that the odor of iodoform may be removed from the hands by wetting them with water, and then applying a small quantity of potassium carbonate and two or three drops of ammonia water. The odor will entirely disappear.

Veterinary White Oil.

Olive oil.....	8 ounces.
Oil of turpentine.....	1 ounce.
Ammonia water.....	2 ounces.

Wisconsin Board Questions.

Herewith are reprinted the questions published by the Wisconsin Board of Pharmacy at an examination held in October, 1910. Other sets of questions asked by this board appear in the issues of the CIRCULAR for February, 1909, page 81; December, 1907, page 780; October, 1904, page 234; October, 1897, page 314; and October 1895, page 250.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give our readers, just as nearly as practicable, the questions as they were presented to the candidates.

Pharmacy.

1. (a) What U. S. P. infusion is made by percolating the drug with water? (b) State why cold water is better than boiling water for this infusion.
2. In making camphor cerate, why is the camphor linniment added last and while the other mixed ingredients are cooling?
3. (a) In preparing solid and fluid extracts by percolation, what should be the rate of flow of the percolate? (b) of tinctures and similar preparations?
4. Six ounces of a solution of bichloride of mercury is required, of such a strength, that one teaspoonful when added to enough water to make one pint, produces a $\frac{1}{2}$ per cent. solution. How much bichloride in the six ounce solution?
5. (a) In what form is ammonium acetate usually dispensed and why? (b) In what form are the iodides and bromides usually dispensed and why?
6. Name the ingredients and method of preparation of antiseptic solution, U. S. P.
7. (a) What two causes may render liquor plumbi subacetatis below the required strength? (b) Why is it necessary to dispense nitrate of silver and permanganate of potassium in distilled water?
8. (a) In giving atropine in a case of poisoning by morphine, what kind of an antidote is used? (b) What kind of an antidote would common salt be, if given in a case of silver nitrate poisoning? (c) State the difference between the two, if any.
9. (a) What are the principal advantages of the official glycerites? (b) Name three of the most important glycerites? (c) Give process for making one of them.
10. (a) What incompatibility exists between many fluid extracts and carbonates? (b) How do you account for the deep red color of Basham's mixture since none of the ingredients used in preparing it has this color?

Chemistry.

1. Name five official chemical compounds of salicylic acid.
2. (a) To what distinct class of chemical compounds does glucose belong? (b) What is the chemical formula? (c) How does it differ from cane sugar?
3. (a) Chemically, what is iodoform? (b) Give chemical formula. (c) State briefly how it is prepared.
4. (a) How are the salts of lead analytically distinguished from salts of zinc? (b) Salts of ammonium from salts of sodium?
5. Describe the principles involved in making alkaloid assays.
6. (a) What is the percentage of mercury in calomel? (b) in corrosive sublimate? In your calculations use atomic weights, 200 for mercury and 35.5 for chlorine.
7. Complete the following chemical equations. Name the producing as well as the resulting substances.
 - (a) $\text{Pb}(\text{NO}_3)_2$ plus 2KI equals
 - (b) 2AgNO_3 plus $\text{Ca}(\text{OH})_2$ equals
 - (c) CuO plus H_2SO_4 equals
8. Differentiate between a volumetrical normal salt solution and a physiological normal salt solution.
9. (a) By what test would you prove the presence of an acetate in aqueous solution? (b) How can olive oil be tested for the presence of cotton seed oil?
10. Write the chemical formula for (a) Bisulphide of carbon, (b) Ferric sulphate, (c) Sodium sulphite, (d) Hydrocyanic acid, (e) Tartaric acid.

Materia Medica.

1. Define the following terms:—(a) Inspissated, (b) Herbaceous, (c) Biennial, (d) Pollen, (e) Succulent.
2. (a) Name the principal alkaloid and what per cent. of the same should Ext. Nux Vomica contain. (b) What per cent. of the extract should the tincture contain? (c) Give percentage strengths of Tinctura Auranti Dulcis and Tinctura Ferri Chloridi.
3. Give official formula and method for preparing Emulsion of Cod Liver Oil, (b) Emulsion of Oil of Turpentine, (c) Emulsion of Asafetida, (d) Emulsion of Chloroform.
4. (a) What is the principal medicinal ingredient and how much of it is contained in 100 grams of Massa Hydrargyri? (b) in 500 grams of Blue Ointment? (c) in 1000 c.c. Tr. of Opium? (d) in 500 c.c. of Spirit of Nitrous Ether? (e) in 200 grams of Ointment of Phenol?
5. Give the official name of each of the following:—(a) Bland's Pills, (b) Brown mixture, (c) Citrine Ointment, (d) Labarraque's Solution, (e) Lugol's Solution, (f) Monsel's Solution, (g) Donovan's Solution, (h) Pulvis Pur-gans, (i) Tully's Powder, (j) Dover's Powder.
6. (a) Give Botanical name and natural order of the plant yielding coca leaves. (b) What official alkaloid does it yield? (c) Give Botanical name of the plant yielding chocolate and (d) what official preparation is a by-product in its manufacture.
7. (a) What is Aloes? (b) How would you detect an adulteration of Gum or Dextrin? (c) What is its active constituent? (d) How is Purified Aloes made? (e) What is the dose of Purified Aloes?
8. Give official names of the following:—(a) Vallet's Mass, (b) Salol, (c) Trional, (d) Sulfonal, (e) Sodium Hyposulphite, (f) Camphorated Oil, (g) Spirit of Glonoin, (h) Carron Oil, (i) Saccharin, (j) Deshler's Salve.
9. Give official titles and doses of five Saline Cathartics.
10. (a) How does the Pharmacopœia direct Triturations to be prepared? (b) Name an official Trituration. (c) Describe the method of making Troches. (d) Name two official Troches.

Menthol Rock Candy.

Crystal A sugar.....	20 pounds.
Cream of tartar.....	2 drams.
Menthol	4 drams.
Water	enough.

Put the sugar in a suitable kettle; add the cream of tartar and 5 pints of water. Set the kettle on the fire and stir the batch until it comes to a boil. With a little water wash down the sides of the kettle, and cook the batch to 340° . Pour the mass on an oiled slab; let it cool a little, and work in the menthol by folding the mass over and over. Work the mass into a long round strip; pull into sticks, and cut into half-inch pieces.

Medium for Boring Glass.

For giving a "tooth" to glass and to aid in boring it with a steel tool the customary way is to use spirit of camphor or a mixture of this spirit with oil of turpentine. A Bordeaux pharmacist offers the following formula for a better liquid for this purpose:

Camphor	1 gramme.
Benzene (crystallizable).....	10 c.c. (mils).
Expressed oil of almonds.....	3 c.c. (mils).

Dissolve the camphor in the benzene and mix with the oil. This mixture is very inflammable.

Foot Powder.

Talcum	8 ounces.
Starch	2 ounces.
Boric acid.....	1 ounce.

The effort to please the ultimate consumer is as pitiless as any force of nature.—*New York Times*.

Some Questions in Drug Store Mathematics.

Here are a few questions which may interest the drug clerk who wants to keep his knowledge of arithmetic bright until such time as he is ready to "go before the board." We invite clerks to send in solutions of these examples and also to contribute problems of a similar nature for publication here. In these examples official strengths; temperature, etc., are to be understood unless the contrary is specified:

1. A formula for toilet powder calls for 100 parts of the finished product. The clerk is told to make a batch of 5 pounds of the powder. How much must he use of an ingredient of which the formula calls for 20 parts?
2. One clerk receives a salary of \$50 a month and saves 60 per cent. of it; another clerk receives \$70 a month and saves 40 per cent. of it. At the end of two years how much has each saved?
3. Wanting to prepare three doses of a powder, each to contain $\frac{3}{4}$ grain, by crushing $\frac{1}{64}$ grain tablet triturates, how many of the latter should the druggist use?
4. How much water must be added to 1 gallon of 90 per cent. alcohol to reduce it to 82 per cent. alcohol?
5. A druggist paid \$2.40 per thousand for envelopes, which came in packages of 25. At what price should he sell a package to make a profit of 66% per cent.?
6. In order to make a pint of chloroform and a pint of ammonia water balance when placed on the two sides of a pair of scales, what weight must be placed on one of the pans?
7. A druggist bought goods for \$8 a dozen and sold them at the rate of \$1 each. (a) What percentage (gross) profit did he make on the sale (b) and what percentage of the selling price was (gross) profit?
8. If the cost of doing business is reckoned as being 20 per cent. of the gross sales, is there profit or loss in paying \$4 a dozen for goods and selling them at 40 cents each?
9. If cigars cost \$35 a thousand and sell at the rate of 6 for 25 cents, how many, out of a box of 50 may be smoked "on the house" by clerks, physicians and ordinary dead-beats before prospective profit becomes actual loss?
10. What proportion of alcohol and what proportion of water should there be in a diluted alcohol selling for \$2.40 a gallon, in order that the alcohol itself (95 per cent. by volume) be made to bring \$3.60 a gallon, taking no account of shrinkage.

Answer to December Questions.

1. 7.48+.
2. 52.87+.
3. About 38½ ounces.
4. (a) 893 grains; (b) and (e) 15.415+ fluid ounces.
5. 9.
6. 15 minims.
7. 22.82.
8. Proprietor, \$630; head clerk, \$547.14; junior clerk, \$542.14 (52 weeks and 1 day in a year).
9. \$10,038 98.
10. 1 pint.

H. J. B., Massachusetts, wants to know how we arrived at the answer to example 7 in the issue for last November, which reads as follows:

Having a jug containing a small quantity of 20 per cent. ammonia water which he wishes to fill, and having only 10 per cent. and 28 per cent. ammonia water with which to do the filling, what proportion of this must the druggist use?

According to the rule of alligation we find the difference between the desired percentage and the stronger solution, which difference represents the number of parts of the weaker solution to be used; and the difference between the desired percentage and the weaker solution represents the number of parts of the stronger solution to be used. In this case this means 8 parts of the 10-per cent. solution, and 10 parts of the 28-per cent. solution. To prove that this

is correct let us see what results we get by mixing the indicated quantities of the two strengths:

$$\begin{array}{rcl} 8 \text{ parts of } 10\% & = & 80. \\ 10 \text{ parts of } 28\% & = & 280. \\ \hline 18 \text{ parts of the mixture} & = & 360. \end{array}$$

By dividing 360 by 18 we get 20, which is the desired percentage. Instead of 8 and 10, we set down 4 and 5 in one answer, as being simpler; just as, in working fractions, for instance, if an answer came out $\frac{25}{50}$ we should set it down as $\frac{1}{2}$.

Restoring Old Engravings.

In reply to a querist, the *Pharmaceutical Journal* says that to restore old and discolored copper-plate engravings, wash the sheet on both sides by means of a soft sponge or brush with water containing 4 per cent. of ammonium carbonate, and rinse the paper each time with clean water. Next moisten with water with which a little vinegar has been mixed; rinse the sheet again with water containing a little chlorinated lime, and dry in the air preferably in the sun. Another plan used for the restoration of old prints that have turned yellow is to wash them carefully in water containing a little sodium hyposulphite, and then dip them for a minute in diluted solution of chlorinated soda (say, 1 in 40), finally washing thoroughly in running water. Solution of hydrogen dioxide may also be used, applied by pouring on the print placed in a shallow vessel. The whole is then exposed to a strong light for some time. If, after treatment by any of the above described methods, the prints have become too white, they should be immersed in a bath containing a weak solution of isinglass or glue colored suitably with coffee grounds or other yellow coloring matter. Finally, the damp sheet should be stretched on a drawing board and allowed to dry spontaneously in a moderately warm, dry room.

Electricians' Test Paper.

A new test paper to distinguish the negative and positive wires in an electric circuit is made by saturating strips of filter paper with the following solution and allowing them to dry:

Phenolphthalein	1 gramme.
Sodium sulphate.....	10 grammes.
Water	100 c.c. (mils).
Alcohol	15 c.c. (mils).

Dissolve the phenolphthalein in the alcohol and mix with the solution of the sodium sulphate in the water.

This paper turns red when touched with a negative pole.

Deodorizer for Dwelling Rooms.

According to the *Bulletin General de Thérapie* a few drops of the following mixture placed on a plate in a room will effectively deodorize the atmosphere:

Camphor	20 grammes.
Chlorinated lime.....	50 grammes.
Alcohol	50 grammes.
Oil of eucalyptus.....	1 gramme.
Oil of cloves.....	1 gramme.
Water	58 grammes.

Mix in a capacious vessel kept cool.

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

Mr. Lascoff's Paper on "Difficulties in Dispensing."

New York, January 15th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

In your January number [page 19] you published my paper entitled "Difficulties in Dispensing," which I read before the Kings County Pharmaceutical Society, for which I thank you. However, I must take exception to your editorial remarks and comments on several statements that I made therein. While I feel complimented for the interest you have manifested, I am quite sure my objections will be well taken; they are in the best professional spirit, and are to the interest of all concerned.

First: In reference to the objection to the use of magnesium oxide, I wish to say that this was taken up at an open meeting, and at that meeting I explained my reason for using magnesia in this particular instance. The reason for using the magnesia was to absorb the oily ingredients, and my suggestions were made to use a few grains only. I am fully aware that in May, 1888, you published in THE DRUGGISTS CIRCULAR the objection to the use of calcined magnesia. Personally I fully concur in the position outlined in that article, and you will notice in my paper which I presented before the American Pharmaceutical Association, that in the prescription which called for valiol, bromide [?] and magnesium oxide, I suggested that this capsule should be dispensed in dry form, simply by adding a few more grains of magnesium oxide, and, by all means not in mass form. In the particular paper which you published you will notice that I avoided the use of magnesia in making the tablets, for I was aware of the fact that the making of compressed tablets with magnesia would not permit the tablets to dissolve in the stomach. My attention was called to that particular prescription by Dr. White, who was the author of the same and who complained that the prescription had been dispensed by another pharmacist with the use of magnesia, and the result was that all the tablets were found in the dejecta undissolved. I used sugar of milk instead, and I found that the tablets gave very satisfactory results, and I exhibited some at the meeting showing their solubility. Taking all these facts into consideration, I was very careful [not (?)] to suggest the use of magnesia in large quantities in the terpinol prescription. What was necessary, was only a few grains to absorb the oil; this I still contend was the only way possible. If you know of any other method, I will be very happy to know it also. I spent many valuable hours in experimenting upon this very prescription and similar ones, and my conclusions were based upon such experiments. I tried almost every excipient known to pharmacy without result.

In regard to your note on the subject of ichthyol, I may say that there is sufficient data upon this drug to

warrant my method of evaporation rather than to substitute another salt instead of ammonium-ichthyolsulfonate, as I do not think this would be the proper spirit. I also know from experience that when ichthyol stands for any length of time, the water evaporates and the drug becomes denser, and assumes the same consistency as a pill mass; and furthermore, Merck's Index and the United States Dispensatory specify that when ichthyol is prescribed, the ammonium compound is meant only. There is no doubt, however, that by evaporation we obtain a suitable working mass and greatly reduced size and weight of the pill. I dispensed the sodium-ichthyol pills, which I exhibited at the meeting, and they were twice the size of the ammonium-ichthyol pills.

In your remark on aspidium, I fully agree with you that it is a toxic drug in itself. I therefore, called the attention of the members to the danger of dispensing it with castor oil, as my prescription called for, which mixture becomes absorbable and causes the poisonous effects. Whereas in dispensing in ordinary emulsion form it simply acts on the worm in the intestines, which is then driven off by following the dose with castor oil, given a good many hours after.

My object in writing this paper of practical experience is to open the door for discussion among the members, and I am very glad that you saw fit to discuss the matter. I would call your attention to the fact that every prescription which I discussed was illustrated and demonstrated before the pharmacists present. If you wish to be convinced by seeing them, I will gladly furnish them to you, as I have them still in my possession.

Thanking you for your interest, I remain, [etc.].
J. LEON LASCOFF.

[Out of differences of opinion honestly held come progress and understanding. Hence it is that we are pleased to receive from Friend Lascoff the foregoing defense of his position on some matters about which we differ with him. No carping criticism was ours, and no attempt to underrate Mr. Lascoff's ability as a pharmacist, thoughtful alike of therapeutic values and pharmacal aspects. Rather did we express our opinion on the moot points believing that it is our duty to stand between an author and his readers just as it is the pharmacist's to protect a patient when an error has been made by a prescriber. Pharmacists and journalists who fail to do their duty in this respect are equally culpable.]

Mr. Lascoff's elaboration of his use of magnesium oxide as an aid out of the difficulty presented in prescription VIII lessens somewhat but does not entirely do away with the pertinency of our criticism. The offending nature of the oxide is of course proportionate to the amount used; in the hands of a pharmacist as able as Friend Lascoff the danger of defeating the object of the prescriber might be reduced almost to the vanishing point; but we believe it could be precluded by using kieselguhr (which is far from the ideal thing) instead of the calcined magnesia.

As to the advisability of concentrating ichthyol by evaporation there is room for a wide difference of opinion. It has been our pleasure to listen to an extended discussion of the nature of ichthyoldisulphonic acid and its ammonium salt by expert chemists. From ideas so obtained, together with a knowledge of the instability of organic ammonium compounds in general, has come a disinclination to subject the sulpho-

ichthyol compounds to any such destructive influence as heat. Although the books tell us that ichthyol loses about one-half in weight when dried on a water-bath, we do not necessarily have to believe that the loss is water, especially when we consider that the accepted formula for this complex substance is $C_{28}H_{36}S_3O_8(NH_4)_2$ (Spanish Pharmacopœia). Many authors of works on materia medica studied in medical schools advise the use of sodium ichthyol for pills, and in our experience, when the attention of the physician is called to the physical and therapeutic advantages of this form of the drug, he usually concurs in the "substitution," much as he would in Friend Lascoff's suggestion that cocaine nitrate and not the hydrochloride be used in protargol solutions.

The toxicity of oleoresin of aspidium depends on absorption and idiosyncrasy. Sufficient of each may exist to render even an emulsion toxic, albeit the danger is greatly enhanced by the presence of a solvent for the filicic acid, and we think it well to emphasize the first named fact, especially as blindness sometimes results from the use of aspidium.—Editor THE DRUGGISTS CIRCULAR.]

Things As They Are.

Brooklyn, N. Y., January 12th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

The pharmacist must be a man a little above the average in intelligence. He must be a business man. At the same time must also pretend to be a professional man. He must be familiar with Mrs. Grundy; also with Mr. Podsnap. He must please the girl by calling to her on the 'phone when her beau comes back from a party where he had a little too much of the raising of the glass, and must please the young man who buys his shaving soap at his store. He must please the father by sending a message to his wife that he will not be home for dinner because he is "detained at the office," and must send a message that mother can not get that particular brand of "patent" medicine that the department store advertised so very cheap, but "they have something just as good." The particularly successful druggist must know what medicine to give to the parrot if he does not speak as profanely as he used to.

"How do you do Mrs. S., what can I do for you?" Answer: "A bottle of cut-rate cast-a-roil, a box of cuticle soap, and five 2-cent stamps." The druggist puffs up and softly says to himself, "Can you beat it?"

The other side of this business of ours is this: If you have luck, ability, a growing neighborhood, no competition, two clerks, a junior and two porters, with your own work thrown in, you may have enough left after paying your household expenses—if they are not very high—to take your wife to the opera, but not too often. If this is not the situation, I should like to see a different, but true, description.

H. RUBIN.

[Since it is said that misery loves company, perhaps our friend Rubin and some others will be pleased to consider the fact that druggists are not alone when it comes to a question of facing and overcoming (if they can) the very fiercest kind of competition: we believe that some of the large department stores have rest rooms for their patrons, with music and free tea, and a place to check babies and other impedimenta.—Editor THE DRUGGISTS CIRCULAR.]

Wail from a Drug Clerk.

Near Philadelphia, January 11th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Perhaps you would like to hear what a clerk who hopes to be a Pharm. D. in May has to say on the subjects of clerk's hours and salaries and a "college prerequisite."

To demand a college degree is unjust to a man who has not the money to spend on a college education, but who has the ability to acquire knowledge from practical experience and books of reference, drug journals included. That a college education applied in the proper way is an excellent thing cannot be denied. A college-educated man is really fitted for a better position than slopping around a soda fountain, doing porter's duties, making preparations from printed formulas and processes, at the magnificent salary of \$18 per week, thirteen days in two weeks, with a full sixteen hours a day. The difficulties of prescription filling are greatly exaggerated. Through all this the clerk is expected to wear out excellent clothing. He is expected to be abnormally happy, wear that expansive grin, while watching his companions come home on the five o'clock train, through with their eight hours' toil, and on a Saturday afternoon, blow some of their salary in on a ball game. While on their way to the game they drop in, buy a cigar, pass out the cheerful comment, "I wouldn't have your job at fifty dollars a day," and then "beat it."

Oh, ye shade of Galen!

Drug clerks are not pessimists but they do want a square deal. The average clerk's salary is 18 cents an hour, a trolley car conductor's, 23 cents.

That the drug store proprietors have it hard in some cases is true. It is only due to their ignorance or lack of energy to take advantage of opportunities that are offered.

The physician, who is the evolution of a barber, and the dentist, who, as a scientist, looks upon a druggist as an inferior, professionally, jeer at a man who has earned his title of "doctor of pharmacy," and uses it. Why?

Prof. Schlotterbeck said that the best men were leaving the profession, and so am I unless I can find something worth while.

PHARMACY RAH RAH.

[There is no law in this country compelling a young man to enter the drug business or an old man to stick to it, but we understand that the street car companies in this city have difficulty in securing the services of honest men as conductors. Drug clerks willing to exchange their 18-cent positions for 23-cent ones will have no difficulty in doing so. The fact that they do not make the change is conclusive evidence that they consider themselves better off where they are. There is a law of supply and demand which regulates the price of all commodities, including the services of drug clerks. This law has fixed the salary of drug clerks at what they are. So long as the demand for clerks is supplied at the prevailing figures, just so long will these figures prevail. Should the demand increase, the figures would have a tendency to go up, but this tendency would be offset by an inrush of young men to get the greater salary. Should the demand fall off, the figures would have a tendency to

come down, but this tendency would be offset by the leaving of the ranks of drug clerks by many young men who would find other and more remunerative employment. In either case the supply and demand would adjust themselves and conditions would not be materially different from what they are now.

Perhaps one reason the title "doctor of pharmacy" is a subject of ridicule is because at the recent examination held by the Pennsylvania Board of Pharmacy, out of 110 candidates examined, all, or practically all, graduates of colleges of pharmacy (and presumably a large portion of them doctors of pharmacy, although we have not the figures at hand on which to base a positive statement as to this), 82, or nearly 75 per cent., failed.

Some men make fortunes out of the drug business, a great many make good livings, some eke out a miserable existence, and some fail entirely. Amend the foregoing sentence by striking out the word "drug" and substituting any other word used to designate a class of business, and the sentence would still be a correct statement. Success depends upon the man and not the business he is in; and, as a rule, successful proprietors of drug stores were once good drug clerks.—Editor THE DRUGGISTS CIRCULAR.]

Establishing Standards for Drugs Not Now Standardized.

Camden, N. J., December 30, 1910.

To the Editor of THE DRUGGISTS CIRCULAR:

The American Pharmaceutical Association's committee on standards for unofficial drugs and chemical products are engaged in formulating standards for a number of articles not now recognized by the United States Pharmacopœia. Many of the articles which they are standardizing will, no doubt, be admitted into the revision of the National Formulary, now in process, and if the standards as promulgated by this committee are adopted in that revision, then they will become the legal standards of the country.

It has been suggested that a list of the monographs immediately under consideration should be published in the pharmaceutical journals so that the importers, manufacturers and dealers who are interested will feel at liberty to make suggestions as to the proper standards to be adopted. It is the desire of the committee to be absolutely fair and accurate as far as possible in our work, and we welcome any suggestions that may be offered.

The following list of titles covers only those on which monographs are now before the committee: Absinthium, aconite leaves, adonis, albumen (dried blood), albumen (dried egg), althea leaves, ammonium hypophosphite, angelica root, angelica seed, areca, arnica root, barium peroxide, boldo leaf, bromauric acid (commercial gold tribromide), buckthorn berries, cacao (cocoa), cactus grandiflorus, calamine, calcium glycerophosphate, calcium peroxide, canella alba, cascarilla, caulophyllum, celery seed, centaury, coal tar, cocculus indicus, condurango, coto bark, cudbear, diacetyl morphine, diacetyl morphine hydrochloride, dextrin (white), dextrin (yellow), euphorbia pilulifera, foenugreek, formic acid, formic acid (concentrated), kava kava, kieselguhr, kola, lead carbonate, oil of cardamom, phenolphthalein, poppy capsules, potassium glycerophosphate, quince seed, red gum (eucalyptus, kino), rennin, saffron, sherry wine, strontium arsenite, thuja (arbor vitae), tonka

bean, Venice turpentine, white pine bark, and zinc peroxide.

It is the intent to publish, from time to time, supplemental lists as new articles are taken up for standardization. In order to give the desired publicity to our work, we respectfully request the pharmaceutical press to give sufficient space to present this matter and request that any suggestions as to the proper standards to be adopted should be sent to the undersigned.

GEORGE M. BERINGER,
Chairman.

A Little Evening Song.

Chicago, January 17th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Your article "Retrospect of a Decade" has just been read and leaves my mood in a B-flat key, like Chopin's Funeral March, and I recall Goethe's little verse, written in that key:

Weber allen Gripfeln
Ist Ruh;
In allen Wipfeln
Spuerert du
Kaum einen Hauch;
Die Voegelein schweigen in Walde.
Warte nur, balde
Ruhest du auch.

What names will appear on the roll of the dead in 1921?
WILHELM BODEMANN.

[A liberal translation of the foregoing lines into English verse by Aytoun and Martin, reads:

Peace breathes along the shade
Of every hill;
The tree-tops of the glade
Are hushed and still;
All woodland murmurs cease,
The birds to rest within the break are gone.
Be patient, weary heart, anon
Thou, too, shalt be at peace.

Editor THE DRUGGISTS CIRCULAR.]

Physicians not a Menace to the Public.

John F. McAnulty, Jr., a doctor of pharmacy who is a drug clerk at Trenton, N. J., writes that when the January issue of the CIRCULAR reached him, he looked carefully through its pages. When he came to the correspondence columns he read of the happiness found in a drug clerk's life by Mr. Wray, of Virginia, and was pleased to say that he agrees with his fellow clerk. But with Mr. Merin he could not agree. Mr. Merin is the writer of the jeremiad printed on page 39 under the title "Physicians as a Menace to the Public." Upon reading this, Mr. McAnulty was astonished and indignant, but these feelings gave way to one of pity, as he expresses it, for the poor mortal who had "exploded" in such a childish fashion. He says he has worked in a number of stores and has waited on the best and the poorest trade, city and country, and so speaks with a feeling that no one can justly say that he knows nothing of his subject. He does not recall that he ever filled a prescription written by a physician for the purpose of supplying cocaine or morphine to a "fiend"; and adds that physicians are sometimes blamed for what pharmacists do because many newspapers print "Dr." in front of the name of a pharmacist who is jailed for cocaine-selling.

Mr. McAnulty speaks of the examinations physicians have to pass in chemistry, materia medica, etc.,

before they can get license to practice medicine, and refers feelingly to the dangers which they voluntarily encounter in their efforts to eradicate epidemics, and the large amount of work they do among the poor without the hope of pay.

Official Books in New York Pharmacies.

Brooklyn, N. Y., January 17th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Attention is called to the change of rules by the new State board of pharmacy and approved by the regents that every pharmacist and druggist in the State of New York must possess a copy of the latest edition of the United States Pharmacopœia and National Formulary.

The rule of the old board required a copy of the Pharmacopœia or some publication embodying its text in full. Rule 7 of the new board reads as follows:

Every pharmacy and drug store shall own and have on file at all times the eighth decennial revision of the Pharmacopœia and the latest edition of the National Formulary, and no registration certificate shall be issued till it complies with the rule.

It is of course also advisable to have a dispensatory as a reference book in a well regulated pharmacy. As this rule is very likely to be enforced I earnestly advise your readers to supply themselves with copies of the two official books, which may be readily obtained through the wholesale trade. Let us hope that other State boards will do likewise.

OTTO RAUBENHEIMER.

New Process of Color Photography.

A patent has been granted in Great Britain for a new process of reproducing colors by photography. The technic is described briefly in the *Journal of the Society of Chemical Industry* as follows: A screen for color photography is prepared by superimposing on a transparent surface, three transparent layers, one layer being ruled with parallel lines, and the others with dots to fill the spaces between the lines; the layers are colored orange, green, and violet respectively, and the screen is provided with guide-marks. An opaque "support" is then prepared to correspond exactly in ruling to the screen, the patterns being colored with the colors complementary to those on the screen. This support is covered with a silver bromide-gelatin emulsion. The object to be reproduced is photographed on a photographic plate through the screen, and the resulting negative is printed in the usual manner on a support prepared as above, which is then developed and fixed. The result is a reproduction in color of the original, but covered with a series of black dots consisting of reduced silver. These are bleached by means of a 1 to 2.5-per cent. solution of corrosive mercuric chloride, and the print is dried, without washing. Cupric chloride, or other chloride capable of converting silver into its chloride, may be used in place of corrosive mercuric chloride.

The increasing traffic in opiates and narcotics in spite of the efforts of the authorities to curb their sale, makes it obligatory on us to avoid even the appearance of evil, and absolutely to refuse to countenance the sale of such drugs except through the prescription department.—W. M. Bowman, in his address as chairman of the section on commercial interests at the 1910 meeting of the American Pharmaceutical Association.

Notices of Books Received.

DEUTSCHES ARZNEIBUCH 5 Ausgabe 1910. Octavo; three-quarter leather; xxxviii + 680 pages. 5.70 mark. Berlin: R. v. Deckers Verlag G. Schenck Königlichen Hofbuchhändler. [New York: G. E. Stechert & Co. \$2.]

On the first of January the practice of pharmacy in the German empire became amenable to this new (the fifth) edition of the German Pharmacopœia. The fifth edition is neither a padded nor a skeleton pharmacopœia, but a sane pharmacopœia, a mirror of the present trend in pharmacy. Owing to the admission of seventy-seven new articles the size of the book has been increased by 164 pages; its general appearance is much like that of its predecessor.

There is a preface of twenty-four pages giving the history, the list of admissions and deletions, the changes in nomenclature and a statement of the scope. The boundaries of official matters pharmaceutical have been extended for the benefit of the student, without, however, giving to the official book the character of a text-book. Following the preface is a chapter occupying fourteen pages treating of general determinations. This treatise is in two parts: *a*, General Technical Explanations deals with solutions, solubility, specific gravity (based on 15°C./15°C.), temperature, optical rotation, micrometric measurements, fineness of powders, sterilization, and the normal medicine-dropper of the Brussels Protocol, which delivers 20 drops of distilled water to 1 gramme, at 15°C.; *b*, Analytical Methods is made up of detailed instructions for determining melting points of chemicals and fats, solidifying points, boiling points, and ash-contents. Practical examples are given in the determination of the acidity of fats, of the acid number of waxes, resins and balsams, and of ester-, saponification- and iodine-values.

The matter devoted to official descriptions and formulas occupies 575 pages. The monographs on drugs are much more explicit than in former editions. Assay processes are given for the standardization of the principal vegetable drugs, and microscopic analytical directions and also ash standards are given in many instances. The monograph on semen strychni (*nux vomica*) occupies three and one-half pages; those on radix ipecacuanhae; opium, cortex chinae (*cinchona*) and folia hyoscyami, three pages each; and those on rhizoma rhei and tubera jalapae, two pages each. For a number of the vegetable drugs, strength rubrics are given; for example cantharides is required to contain at least 0.8 per cent. of cantharidin; ipecac, 1.99 per cent. of alkaloids.

In the monographs on chemicals an innovation has been introduced: the giving of the chemical or graphic or even structural formula and also the atomic or molecular weight. As to the purity rubrics the new book goes further than the United States Pharmacopœia, as witness the statement under ammonium bromatum: "contains at least 97.9 per cent. of ammonium bromide corresponding to 79.9 per cent. of bromine." The chemical monographs are also very complete, that on ferrum pulveratum, for instance, occupies more than a page. Apparently the compilers had no trepidation concerning the use of trade-marked and popular names; among the official Latin names the following stand out prominently: *Anæsthesin*, *novocain*, *pyramidon*, *stovaine*, *sulfonalum*, *tannalbin*, and *vaselinum*; among the official German titles and recognized synonyms are

aspirin, dionin, duotal, heroin hydrochlorid, lactophenin, protargol, and trional.

Galenical preparations, the pride of the apotheker, are, as formerly, described, but such expressions as "sweet taste" or "pleasant odor," etc., have been omitted. One very important factor has been added relative to preparations, and that is a strength rubric, or statement of the amount of the medicament in the finished product. Much space is saved by the use of type processes. There are good directions for preserving and storing preparations. The analytical methods, usually volumetric, have been carefully revised and are quite voluminous in several instances.

Anti-diphtheritic and anti-tetanic serums and Koch's tuberculin are official.

In the appendix is a table of atomic weights; a list of reagents and volumetric solutions; a table of comparative specific gravities at from 12° to 25° C.; a list of biological reagents; a table of maximum doses, single and daily, any intentional excess of which must be indicated by the prescriber; tables of poisons and potent medicaments; and a list of synonyms.

THE STUDENT IN PHARMACY, Embracing Theoretical and Practical Pharmacy; a Guide for Studying the Preparations of the Pharmacopœia and National Formulary Which Are Here Included only by Reference. The Book Is Intended To Direct the Student in His Studies and as a Convenient Review for the Pharmacist, Containing also Nearly Four Hundred Board of Pharmacy Questions with Answers, Convenient Formulas and the Pure Food and Drugs Act with Rules and Regulations. By E. G. Eberle, Ph. G., A. M. (Hon.) Volume I. Octavo; Cloth; 224 pages, illustrated. \$2. Dallas, Texas: *The Southern Pharmaceutical Journal*.

Somewhere between the more pretentious textbooks of pharmacy and the "quiz compends" one would place this latest contribution to the literature of practical pharmacy. Its scope is quite well set forth in the sub-title. Its style is that of the lecture: simple, conversational. The author has omitted all detailed reference to the text of the United States Pharmacopœia and the National Formulary because, as he states, the student should have access to these direct.

There are doubtless many who will be glad to have the answered board questions which cover forty-five pages of the book. Many others will perhaps find useful the tables of percentage solutions, alcoholic content, dosage, incompatibilities, etc., as well as the prescription hints.

MISSOURI BOTANICAL GARDEN; TWENTY-FIRST ANNUAL REPORT. Octavo; cloth; 195 pages, gilt tops; 32 plates. St. Louis: Published by the Board of Trustees. 1910.

PROCEEDINGS OF THE MAINE PHARMACEUTICAL ASSOCIATION at the Forty-third Annual Meeting, Held at Castine, July 6th and 7th, 1910.

TWENTY-FIFTH ANNUAL REPORT OF THE MASSACHUSETTS BOARD OF PHARMACY for the Year Ending November 30th, 1910.

THE PRESERVATION OF DRUGS; Bulletin No. 150, Kentucky Agricultural Experiment Station of the State University, Lexington, Ky.

TWENTY-EIGHTH ANNUAL REPORT OF THE ILLINOIS BOARD OF PHARMACY for the year 1909.

Some Election Returns.

When the sixty-second congress convenes there will be missing from the ranks of the representatives that fervent favorer of a federal pharmacopœia and arbiter of elegance in diction, H. M. Coudrey, of Missouri. He alone of all those who have of recent years had largely to do with attempts at the federal regulation of pharmacy has not been returned by his constituents.

The roll of the senate at the next congress will contain these names of interest to pharmacists: S. M. Cullom, W. B. Heyburn, and R. L. Owen. In the house the following men who have been in the pharmacal eye will again answer the roll call: F. D. Currier, D. J. Foster, J. R. Mann, and S. E. Payne.

Several New York State law-makers with a penchant for pharmacal measures failed of re-election to the present session of the legislature. Among the names missing from this year's roll is that of the doughty champion of Governor Hughes' desires in matters pharmacæutic, R. S. Conklin. Others who are not enrolled in the records of the assembly are I. J. Joseph, the combatter of corporation pharmacies, and Druggist G. H. Whitney. Senator H. W. Hill is also among the missing. There still remain J. J. Frawley and J. M. Wainwright in the senate, and Druggist C. F. Brown, W. S. Coffey, J. A. Foley, and A. E. Smith in the lower house. The one-time familiar name of L. A. Cuvillier, a prolific father of labeling bills, again appears on the legislative rolls of this State.

New Medical Organization.

Now comes the American Medico-Political Reform League, launched at Chicago, for the purpose of procuring the establishment of a national bureau of health, "divorced from politics and gang control"; the establishment of a uniform standard of medical requirements in the several States of the Union; encouragement and co-operation with all movements and legislation for food reform which shall be fair and impartial and founded on scientific premises; encouragement of political preferment of physicians as tending to secure just representation for the profession; encouragement of measures for the correction of hospital and dispensary abuses.

DRUG STORE ADVERTISING

By M. P. GOULD, of New York

In this department some of the fundamentals of successful drug store advertising will be expounded each month. The aim is to correct errors of advertising and establish the most profitable and advisable methods of building up retail drug trade by means of the powerful influence of advertising.

The Wastefulness of "Near-Advertising."

There is one fault in retail advertising which should be corrected. It is a fault common to almost all retailers. The druggists lose by it, the grocers lose by it, the hardware dealers lose by it, the haberdashers and the shoe dealers lose by it. Fortunately for the department stores they have already eliminated this form of waste to a great extent.

This waste that I refer to has risen very naturally. One example: Here is a retailer who has a very good customer. This customer has been buying all of her goods from him for years. She happens to be quite a church woman, she happens to be a willing and earnest worker. Her church decides to get up a bazar in order to raise some money for some charitable work, and the church, knowing that she spends considerable money in various stores about town, they vote for her to take in charge the getting up of a "program." So she goes to a printer and gets him to make up a blank program of the size she hopes to finally produce. She writes in on certain pages of this blank book the program itself. Then she goes to the store where she buys most of her goods and gets the proprietor to put a full-page advertisement in this program. She being a good customer of the store and the proprietor wanting to be friendly to her and really wanting to help the cause of the church pays her \$10 for a page advertisement. With that as a lever she goes down the line and persuades one after another of the storekeepers with whom she trades to take pages, half pages and quarter pages in this program. After she has rounded up all of the stores where she trades, with all of their contracts as a lever she starts after the other retailers and also the hotels, the street-car company, the lighting company, the water company; and so she goes the rounds and they all contribute.

Before she gets through she has altogether about twelve pages of advertising matter, and three pages of program. As a result of her slaving for two weeks she has got perhaps \$120 worth of advertising, but she has to pay \$90 for printing the program, consequently she turns over to the bazar committee \$30 profit. In other words, only one-fourth of what the merchants gave goes to the church, the other three-fourths goes to the printer.

If it always worked out in this way it would not be so bad. But in a majority of cases it turns out that the program advertising barely pays the expenses or possibly brings in only three or four dollars profit. Then the merchants have spent their good money only to have but one-tenth of it go to the church.

In short, it is misdirected charity. If the merchants want to give money to charity, they should give it to charity; not give three-fourths or nine-tenths of it to a printer and one-fourth or one-tenth to charity.

If all of these program propositions were as good as the one mentioned above it would not be so bad; however, the fact is that for every "ball of the Ash-carters' union," every "tin-pan athletic meet," every "fraternal festival," every "street fair," every "orphans' home benefit," every "high school dance," every "seaside association" and for everything else that people can think of, somebody comes along with a program for the merchants to advertise in.

It does not pay the merchant. That's the opinion of 99 out of every 100 retailers. They count all such advertising as this sheer waste, and they know it is. In fact, I have never talked to but one man who did not say that this kind of advertising was a pure and simple "hold-up." It is an advertising waste which most men want to get rid of.

In various places this waste has been overcome in several ways. For example the way large department stores overcome it is to have their directors pass a resolution for-

bidding the advertising manager from doing any advertising of the kind. Then when a customer of the store comes soliciting advertising the manager is very nice to her and he takes great pains to explain to her that "the directors" have passed a resolution forbidding his going into any advertising of the kind, and that his hands are tied. He assures her that he would like to help her, but he cannot do it. She goes out of the store feeling that this store is a good friend of hers and that this man would like to give her the advertising if he could, but "the directors" — whoever they may be — have tied his hands, so that he cannot. She does not get angry at the store; "the directors" are impersonal beings somewhere who have made it impossible for her to get an order out of the advertising manager.

Another way that this graft has been overcome is by all the retailers in a town getting together and forming an association which they call "the board of trade" or "merchants' association" or something else of that kind. This merchants' association meets and votes that each member contribute a certain amount to charity and for charitable advertising and that the secretary of the association is to dispense that fund. Each merchant is then supplied with a sign saying that all program advertising is in the hands of Mr. So-and-so, secretary of the "merchants' association." When the lady customer-solicitor comes into a store the proprietor explains to her that he is a member of the merchants' association; that the merchants association has voted that advertising of that kind she has to dispose of shall be taken care of by the secretary; and that she should call on the secretary and he will go into the matter with her. The solicitor finds that this man in justice to the other merchants abides by the rules of the association; and when she calls on the secretary, of course, the secretary's hands are tied because of the lack of an appropriation. So the whole matter is killed. Thus the individual merchant does not lose the good will of his own customers.

Still another way to get rid of it is for the merchant to make his appropriation for advertising at a certain time in the year; to lay out a schedule of just what he will do for the whole year. (This is a good thing to do anyway: it is what every merchant ought to do.) Now, when the lady customer comes in soliciting advertising for the "program" the merchant is

The handiest of all in emergency needs, a good Hot Water Bottle is a modern necessity.

Hot Water Bottles

Perfect quality, new models, right sizes, longest wear, greatest satisfaction and economy if you buy here.

very nice to her. He explains to her that at the beginning of each year or at a certain time each year he plans out his advertising for the entire year; that he buys his advertising just as he buys his goods; that he tries to buy the kind of advertising that will do him the most good; and that his contracts have all been placed. He can explain that were it not for these contracts he would gladly help her out; but since he must live up to his contracts, and since he has already outlined as much as he can afford it is impossible to help her. This talk is effective with most women and others who are soliciting program advertising.

Undoubtedly there are some merchants who still believe that this kind of advertising pays. Undoubtedly they have not the nerve to cut out this program advertising. There are certain small merchants who still look upon advertising as a sort of "free drink," "complimentary box of cigars," "hand-out," "bribe," "present" to get or hold the good will of some friend. The day of such belief is past or ought to be. Any man who spends money for program space and looks upon it as advertising is simply throwing his money away. If he wants to spend money in that way he ought not to call it advertising; neither should he call it charity. If he wants to give to charity he ought to give to charity, and not in such a way that 75 per cent. or 90 per cent. sticks to the fingers of the people who are handling it before it gets to charity. If I want to give a dollar to a needy man I don't throw ninety cents in the street and give the man ten cents, but I go right to that man and give him the dollar: I see that the whole one hundred cents goes to the man that I want to get it.

It is an old and exploded notion that handing out a "program advertisement" here and a "hotel blotter" there and an "association year book" somewhere else brings business. It does not. There are any number of merchants in America who can show that it does not bring in enough business to "shake a stick at."

Furthermore there is something else—quite the reverse—that spending money in such so-called advertising does do. It cripples the merchant in his appropriation for real advertising. For example, suppose a man is doing a business of \$20,000 a year, and he decides that he can spend 2 per cent. in advertising, which is \$400. If he spends \$200

of that \$400 with his local newspapers he can carry on a progressive campaign of advertising which will increase his business. Then if he spends the other \$200 in live advertising material: strong circulars, post cards, letters and other direct mail matter he can back up his newspaper advertising to such an extent that he is assured a growing business. Suppose, however, that he takes \$100 every year away from his newspaper advertising and spends it on space in programs and similar advertising which does not bring him any returns. Then he loses on his newspaper advertising because it does not pay him any more and he wastes on the program advertising so that he cripples himself, prevents his business going ahead, wastes his trade and lets his shrewder competitor get ahead of him. Or if he takes \$100 out of his \$200 appropriation for circulars, store signs, window displays, letters, post cards, etc., and puts it into program advertising he then cripples his direct mail work, his sign work and his display work so that all of them are far below par, and not very productive, and his program advertising is not productive either. So, by spending his advertising appropriation on wasteful and unproductive methods, he prevents himself from doing advertising that would be productive.

This is really the important part. I hate to see any merchant fail. I like to see him spend his advertising appropriation, even though he only spends \$30 or \$40 a year, in such a way that every cent of that money pulls the biggest amount of business that it can pull.

Efficiency, the greatest possible efficiency, is the thing that the business interests of America are now giving their attention to. We are all learning that in the development of business in this country a great many useless, wasteful and ineffective customs have grown up. The "discovery" of the present day is that there are such wasteful and ineffective customs. Knowing that there are, it is now our business as a nation to eliminate those things which impede our progress. Exactly the same argument holds good for the small retailer. If he can find a form of lighting that costs him one-half what he is now spending and furnishes just as strong and just as bright a light, it is his business to make that improvement. If he finds that by taking out his old windows and putting in a new front, and then making a good display of merchandise in his windows, he can increase his business, then it is his

Next Door to You— —No Matter Where You Live

Your telephone directly connects you with our store at all hours of the day and night. If there is anything you want in a rush—or not—any time, just ring us up, and give us your order; we will deliver the goods anywhere. This brings our store right to your door just when you may need us most, in time of accident or emergency, or when the weather or anything else prevents a trip to the drug store. Have us call for your prescriptions, fill them and return them "rush." It costs you nothing extra, at all.

(Name and Address)

business to put in this new window and employ new methods of display. If he finds that his soda fountain is not giving satisfaction; that it is unsanitary; that people do not come to his fountain as they do to other fountains in town, then it is his business to put in a new fountain and new methods and new help until he gets the trade coming to him.

Just so with advertising. If a merchant finds that the methods of advertising he has been employing do not bring results, then he ought to drop these methods like a "hot potato." The trouble with most of us is that we are bound by custom, by habits, by traditions, by fear of making mistakes, by a foolish blind adherence to methods that are not succeeding.

A few days ago I had the pleasure of attending the annual meeting of the New York Zoological Society at the Waldorf-Astoria Hotel. At that meeting "Buffalo Jones" showed some moving pictures of Western cowboys roping wild animals in Africa. The film showing the roping of a rhinoceros was one of the most appealing things I ever saw, and it was pitiful. There was a great beast with twenty-six-inch horns. The moment the first cowboy rode up close to him he lowered his head and with perfect confidence in his own strength started after that horse and rider. The cowboy rode just a little ahead of the rhinoceros while cowboy number two came up from the rear, swung his lasso, and got the rhinoceros by one front foot and dumped him on his head. The rhinoceros got up raging because that thing—whatever it was—had happened to him. He turned and started after the nearest horse and rider who happened to be the one that had a rope attached to his front leg. Meanwhile the moment he was dumped on his head rider number three galloped up close behind him and when the "rhino" started after cowboy number two, cowboy number three roped one of his hind legs and tripped him up again. By that time the beast was simply blind with rage. He jumped to his feet and, recognizing that he was in a good place to get away from, started to run away. That was exactly what cowboy number one thought he would do and he was sitting there calmly on his horse waiting for that move, and swung his rope around one of the beasts other legs. There they stood; the rhinoceros panting and blowing and helpless with a cowboy and horse in three different directions, each with a rope fastened to a different leg. As I watched that poor bewildered beast, whipped and helpless, I could not help thinking that this is exactly what a great many merchants do. They rush at things. They get set on doing certain things in a certain way and they use up all their strength just as that poor, deluded rhinoceros did, until finally they stand whipped in just the same way.

Just what in these articles I have tried to do for the last twelve and a half years is to point out to retailers various fundamental methods of eliminating waste from their advertising and from their entire business, and introducing new methods which have proven their value as business-getters and business-holders. In this month's contribution is pointed out a method of handling advertising which if followed out would do much towards making the retailer's advertising more successful and thereby increasing his business and his profits faster and to a far greater extent.

Nelligar's Greeting.

As New Year cards Nelligar's Pharmacy, Norfolk, Va., sent out neat booklets, with fancy backs so folded and attached as to provide a hidden pocket in which was placed a bit of sachet powder. On one page of the booklet is a calendar for 1911, and on the opposite one appears this greeting:

"Just a little souvenir to remind you that we appreciate your patronage and cordially invite you to our store, where we hope to have the pleasure of supplying your wants in our line during 1911. With the season's greetings, sincerely yours, Nelligar's Pharmacy, Fred. D. Nelligar, proprietor, corner Church and Charlotte streets, Norfolk, Va."

Getting the Customer's Confidence.

The advantage of the personal service of the neighborhood drug store and the dependability of the druggist's advice are introduced by E. C. Webb, the manager of the Universal Drug Shop, Seventh avenue and One Hundred and Forty-first street, this city, in a recently distributed letter addressed to the women of his neighborhood. The

burden of the communication was the "pure, prompt, accurate" policy of the prescription department.

Mr. Webb uses the package slip medium for much publicity. One of his favorite slips is devoted to the superiority of the solution of magnesium citrate put up in the laboratory of the store. This excerpt will show that it has the right ring:

The citrate of magnesia made from the commercial variety of magnesium carbonate is more active than the pure, but this additional activity is due to the irritating influence of its impurities, and its constant use would have a harmful effect on the intestines and stomach.

A Philadelphia Druggist and the Red Cross Stamp.

For twelve days prior to Christmas Israel Subin, of Philadelphia, devoted one entire window to a display of the red-cross Christmas stamps. In the center of the trim and at each side were large framed pictures and signs such as have been used in the tuberculosis crusade. In the center of the window hung a large red-cross and in the background were figures of four red-cross nurses holding trays filled with red-cross stamps. Stickers on the upper part of the glass called the attention of the passers-by to the sale of these stamps, the price of them and the cause to which the funds accruing would be devoted.

Mr. Subin says that in addition to helping a very worthy cause by increasing the sale of the stamps, the display was resultful as an advertisement for the store through the favorable comment which was created. The display was supplemented by circulars anent the good purpose of the sale of red-cross stamps.

To Sanguard Match Factory Workers.

In anticipation of prohibiting legislation which seemingly would soon have crowned the efforts of the American Association of Labor Investigation, the use of white phosphorus in the manufacture of matches is to be discontinued in this country, by virtue of an agreement among the manufacturers. This agreement has been made possible by the action of the so-called "match trust" in voluntarily surrendering its patent rights to the use of phosphorus sesquisulphide, a harmless substitute for the white variety.

The control of the patent rights, for which it is said \$100,000 was paid, has been given to three trustees: J. H. Ralston, counsel for the American Federation of Labor; Prof. E. R. A. Seligman, of Columbia University; and Charles P. Neill, Commissioner of Labor.

Validity of "Rexall" as a Trade-Mark.

In a recently recorded judgment the Massachusetts supreme court sustained the contention of E. M. Riggs & Co., of Haverhill, that the use of the word "rexall" on medicinal preparations was an infringement of their trade-mark rights to use the word "rex," which were established thirty-three years ago. The case has been referred to a master for the computation of damages. These, it is reported, will amount to close to \$1,000,000.

It is stated that the defendant, the United Drug Company, will take the case to the full bench of the supreme court on a bill of exceptions calling for a review of the legal points involved.

Legal Status of A. M. A. Officers Questioned.

Dr. G. F. Lydston, of Chicago, who has frequently engaged in wordy conflict with the powers that be in the American Medical Association, has filed a bill petitioning the State's attorney of Cook county, Illinois, to begin quo warranto proceedings against the trustees of the association. The petitioner alleges that the A. M. A. is being operated as a "close corporation, autocratic and despotic," and that the present officers are not legally entitled to their positions because the last election was not properly conducted.

Another conviction for impersonating another in taking regents' examinations has been secured. The guilty student was sentenced to serve nine months in the penitentiary.

Prof. John Uri Lloyd is a member of the grand jury in session at Cincinnati, probing, among other things, illegal voting.

SODA WATER DEPARTMENT.

Something Seasonable in the Window.

At least one window display a month should be devoted to the soda water department. That means that with two windows and weekly trims the department gets a one-eighth share of this sort of publicity. Special drinks, while not to be the only ones featured in the window displays, lend themselves to more diversified trims than do the staples. A special drink on a special occasion affords a double opportunity for working in a paying window show; hence the following suggestion for Washington's Birthday:

In the first place the special drink is to be called cherry chips. It consists of 1 ounce of cherry syrup, $\frac{1}{2}$ ounce of orange syrup, and sufficient hot water to fill a hot-soda mug, topped off with whipped cream and accompanied with a piece of crystallized ginger.

For the display, cover the floor of the window with green sawdust, and scatter over this a goodly array of chips from an old-fashioned wood-pile (the sort with bark on them). In the visual center (not the geometrical) of the green place a real or artificial stump having a freshly hewed appearance on top; stick a hatchet in this carelessly. That is the setting; most of this display is a matter of placards and phrases. Paint the name "cherry chips" in red lettering on the larger chips scattered about. Stand a placard against the stump with this wording: "A Favorite Cherry Tree Furnished the Fruit from Which *Cherry Chips* is Made." Another prominently placed card should have this legend: "The Truth about Cherry Chips Can't be Told, It Must be Learned through Experience." Hanging about variously should appear the following legends: "Cherry Chips: a Delight Washington never Knew." "Had Cherry Chips been Obtainable Washington would not have Thrown his Dollar across the Potomac." "For a Feeling of Comfort and Altruism Drink Cherry Chips."

As the background of this trim hang a portrait of Washington in the center with red-white-and-blue streamers stretching to the four sides.

A Glance Backward.

At first, soda water was a man's beverage. It was carbonated but not sweetened water, in demand for that "morning after" feeling. Gradually it was improved until women and children became the chief consumers of it. Now it has been still further improved until it again appeals strongly to the man portion of the population, while holding the allegiance of the women and children and gaining new friends among them.

When some of us older chaps were boys, soda water was drawn from a dog-house pattern of marble box on the counter, and consisted of syrup, strongly flavored with synthetic fruit essences, a deal of foam, and the regulation carbonated water. It was facetiously spoken of as "sweetened wind." At one time this kind of beverage sold for 10 cents a glass, but soon found its proper level among 5-cent goods.

Following this style of apparatus came the wall design, to use which the attendant had to turn his back to the customer. This style has since given way to the modern style of fountain built principally below the counter, with the draft arm extending up through the marble slab.

A generation ago—a score of years ago—a dozen years ago—even half the latter number of years ago—the soda water business was small compared with what it is now. Improved apparatus, a higher class of ingredients, a wider variety of things to tempt the palate and quench the thirst, the introduction of ice cream at the fountain, the evolution of the artistic dispenser, these and other things have made soda water what it undoubtedly to-day is, the great American beverage. Attempts to introduce this article into other countries have not been notably successful; but he would indeed be a brave man who would propose to deny the soda water luxury to the people of the U. S. A.

Push the drinks that pay, of course, but be sure not to push hard enough to shove the customer into your competitor's store. Every now and then make an attractive window display advertising the fountain.

Women frequently do not observe that a marble counter is wet or sticky until they have leaned upon it, and then explanations and apologies do not repair the damage.

Root Beverages.

Having been successful in making and dispensing root beer and ginger ale, a portion of which success he attributes to hints obtained from the CIRCULAR, W. C. Lane, of the Lane Drug Company, Goldsboro, N. C., sends a few suggestions as a token of his appreciation of the service this paper has been to him. They follow:

CONCERNING ROOT BEER.

Numerous formulas for making root beer extract and root beer syrup have appeared in THE DRUGGISTS CIRCULAR, the best of which I have found to be one by F. E. Dudman, printed in the number for June, 1908, page 262, but this is improved when changed as here indicated:

Root Beer Extract.

a. Methyl salicylate.....	12 drams.
Oil of sassafras, true.....	9 drams.
Oil of cloves.....	3 drams.
Tincture of ginger (U. S. P.).....	12 ounces.
Alcohol.....	enough to make 1 pint.
b. Citric acid.....	10 av. oz. 180 grains.
Water.....	enough to make 2 pints.

Be sure to use methyl salicylate as it gives a much better flavor than oil of wintergreen [maybe Mr. Lane used oil of birch, sold to him for true oil of wintergreen] and has the further advantage of being much cheaper. On the other hand, the true oil of sassafras does better than the synthetic. It is also necessary to be exact in measuring the ingredients, as any slight variation affects the flavor.

Root Beer Syrup.

Root beer extract, a.....	2 drams.
Root beer extract, b.....	4 drams.
Soda foam.....	4 drams.
Caramel.....	$1\frac{1}{2}$ ounces.
Syrup (U. S. P.).....	enough to make 1 gallon.

A Good Ginger Ale.

Ground ginger.....	2 oz. av., 180 grains.
Powdered capsicum.....	30 grains.
Fresh lemon peel, sliced.....	1 oz. av., 262 grains.
Citric acid, powdered.....	144 grains.
Diluted alcohol.....	enough.
Syrup (U. S. P.).....	enough to make 1 gallon.

Mix all the ingredients except the syrup in a capacious glass vessel (a half-gallon fruit jar will do), close tight, and shake at frequent intervals for twelve hours. Then transfer to a funnel and allow the liquid to drain off, returning the first portions until the drip is clear. Bring the finished product up to 1 pint by passing diluted alcohol through the mass in the funnel. Finally add the syrup.

This syrup may be colored with caramel if desired, and if too gingery a little lemon syrup may be mixed with it.

A Fountain in the Basement.

What is said to be one of the largest and best drug businesses west of the Mississippi is that of the Sherman & McConnell Drug Company, at Omaha. In the main store of this company something new in the soda department is soon to be tried; the fountain is to be placed in a room under the sidewalk at the front of the store, reached by a stairway leading from the inside of the store, well toward the front.

The opinion of the editor of this department is that the more accessible the fountain the greater the business that will be done by it. The fountain which is in plain sight of the street and preferably about on the level of the sidewalk or at any rate not more than one short step above or below it, is the one which will catch the trade—other considerations being equal.

Medicated Soft Drinks.

In her annual report for 1910 as superintendent of the department of medical temperance of the National Woman's Christian Temperance Union, Mrs. Martha M. Allen says:

An extensive campaign against soft drinks containing drugs was carried on last winter and spring. Three leaflets and a letter upon drug drinks were sent to every member of every State legislature in session in 1910, and to ministers, editors, health officers, college presidents and many others. Over 10,000 people were thus reached. Packages of leaflets on these drinks were sent free to W. C. T. U. workers in every Southern State. This campaign cost nearly \$300. Bills regulating, or forbidding, the sale of these drinks were introduced into the legislatures of several Southern States, but none were enacted into law so far as I have been able to learn. The W. C. T. U. of Cincinnati, O., has done excellent work against drug drinks.

Baltimore Men Good Soda Patrons.

The answer to the question how to make the soda water fountain pay and increase the business depends, in the opinion of experienced dispensers in the Monumental City, largely upon location and the kind of business to be attracted. The fountain with a great preponderance of woman customers will probably find it advantageous to exercise ingenuity in devising fancy decoctions, supplying wafers and adopting other ideas not directly connected with the compounding of beverages. With the fair sex, display will be found to go a long way, frequently making a stronger and more lasting impression than the quality of the drink. Elaborate signs, "bills of fare," and other devices will help materially to draw this class of trade, the character of the beverage being frequently lost sight of in admiration of the trimmings.

With a store having chiefly men for customers the problem is wholly different. Mere man is believed by some observers to be far more discriminating than his wife or daughter when it comes to judging the goodness of a drink, but he compensates for this by making relatively small demands in the matter of display. Men soon develop a taste for certain decoctions and stick to them, being as constant in their soda allegiance as is the toper to his stronger tipple. Their range of taste is also comparatively limited, and the dispenser of soda for a male clientele is not required to rack his brain for novel combinations with which to tickle the palate of his customers.

This, at least, has been the experience of Morgan & Millard, druggists, at Baltimore and South streets. The firm is just on the edge of the financial district, away from the shopping section and its patronage consists almost wholly of men. This stand was secured by them after the great fire of February, 1904, which occasioned some shifting in the character of the business in the immediate vicinity and made the neighborhood more than before a district devoted to the activities of men. The problem which the firm had to solve, therefore, was how to please men, not a few of whom had been taking something stronger than soda water.

WOMEN ARE FREE-LUNCHERS.

"We soon found," said Charles Morgan, senior member of the firm, "that the men cared little for variety. They would come in and call for the same thing every day or whenever they felt that a glass of soda water would be relished. At the most their selections would take a narrow range. We also discovered that it was unnecessary to make use of what has been deprecatingly spoken of as 'the free lunch' feature to draw business. A woman might instinctively look around for a wafer or graham cracker or something of the sort, but to a man it seems to make little or no difference whether such a thing is in reach as he sips his soda. He comes in primarily to get a drink, and he will not walk half a block out of the way to favor a place that gives him something more. Of course, we always keep a bowl of some fancy crackers on the counter, but beyond this we do not find it necessary to go.

WHAT MEN PREFER.

"It is also our experience that most men care little for fancy drinks. They are very fond of chocolate, and all beverages with chocolate as a flavor are exceedingly popular. Chocolate is called for in numerous combinations, hot or cold, and the quantity of chocolate we use is rapidly increasing. We have also found that the popularity of egg drinks is on the increase, men taking them not merely to allay thirst, but as food. Our chief difficulty of late has been the high price of eggs. Of course, we must get eggs that are absolutely fresh. They are broken right before a customer, and for a patron to see a bad egg broken gives him a shock which he does not soon get over; he will always hold it against the establishment. To get eggs that could be depended upon, therefore, we have been sending into the country and paying 50 cents a dozen, which cut seriously into profits. Under ordinary circumstances there is an excellent margin of profit in egg drinks, which average about 15 cents in price. As a rule we stick to the regular decoctions, taking care only that all the ingredients are of first class quality. We have no peculiar touches, although it is important that the dispenser should know his business and get just the right proportions. Our list of beverages includes most

of those to be found in other drug stores, though I must admit that we put them up just a little bit differently.

FRESH JUICES AND HEAVY SYRUPS.

"And right here let me mention another thing, which is no secret and which we don't object giving competitors the benefit of. The fruit flavors should be of fresh fruit, especially the juices of citrine fruits. Manufactured products of these that have been prepared and shipped for long distances will not meet the requirements of discriminating patrons of the soda fountain. It takes trouble to grate your oranges and lemons, but the results are worth the pains; you satisfy your customers. Any juices when allowed to stand for a considerable length of time, lose some of that delicacy of flavor which they should have, and get just a trifle sharp. It may also be well to state that syrups should be made up fairly thick, with enough body to keep. Light syrups readily lose their richness and are apt to spoil.

CARDS AND HANGERS.

"We do not believe in elaborate cards or other detracting features, which tend to cheapen the appearance of a fountain rather than attract favorable attention. Accordingly, we use nothing by way of advertising beyond a few cards or blackboard, with neat white lettering giving the names of a few of our drinks. Our egg drinks embrace chocolate, phosphate, calisaya, egg and milk, coffee, lemonade, and a few others, most of them selling for 10 cents. The price of the lemonade is 5 cents. Sundaes include chocolate, vanilla, pineapple, lemon, orange, fruit, strawberry, raspberry, cherry and others, at 10 cents. Our only other display is a card outside the store, on which a different beverage is made prominent every day.

"Men do not care much for fancy mixtures or for ice cream drinks, and we make no special effort to popularize these. If called for, they are served, of course, but this part of the business is not singled out or encouraged more than any other.

COLD DRINKS IN WINTER.

"Though we have not departed from what may be called strictly legitimate lines, our business has steadily increased, notwithstanding the fact that we entered a new field and had much competition to face. What is more, we are doing about as much now in winter as we do in summer, the winter business having grown even more rapidly than that during the hot weather. Hot drinks are naturally served in winter, but the number of persons who prefer their favorite beverages cold is surprisingly large.

FOUNTAIN PROFITS LARGE.

"Our view of the matter is that the soda water trade affords a very handsome margin of profit if handled right, and constitutes a most valuable adjunct to the drug store."

Tips and Formulas from Atlanta.

Atlanta ranks among the best soda towns of its size in the country. The rule there is for the floor of the store to be nearly on the level of the sidewalk, the idea being that the easier it is for people to get into the store, the more will enter. Doubtless this is true. Wide doors, kept invitingly open except when weather conditions do not permit, are another silent but largely effective invitation to the public to enter.

One of the leading fountains in the Gate City is to be found in the store of the Jacob's Pharmacy Company. A few years ago the CIRCULAR mentioned that a whole-page advertisement of this company's soda department had appeared in one of the Atlanta papers issued October 11th, and called attention to the size of the announcement in connection with its date. The advertisement stated that all glasses, spoons, etc., were sterilized after each using, and that the syrups were prepared on the premises in a steam-jacketed boiler, which insured freedom from scorching.

The fountain's head dispenser informs the CIRCULAR that it is conducted on the theory that the prime requisite to success is the public's patronage, and that this point is borne in mind at all times. It is required of all attendants that they keep their clothes and their hands clean, and each one is responsible for certain work to be done to keep the dispensing department in the best possible shape at all times. Cleanliness, system, style, he says, are three words whose meaning should always be

borne in mind at the fountain. The head dispenser should so arrange the glasses, ice cream, whipped cream, and all other ingredients, as well as the appurtenances that the maximum of speed in dispensing may be obtained with a minimum of effort.

Journals should be read, continues this authority, and the formulas which they contain should be studied, but not necessarily adopted. They serve as suggestions, and each manager of a fountain should be able to adapt them to meet the requirements of his trade. One of his own favorite formulas is the following:

Gate City Punch.

Fill a sherbet glass two-thirds full of vanilla ice cream; top off with whipped cream; but a cherry and marshmallow on top; and sprinkle lightly with ground nuts.

For this confection he charges one dime.

Here are a few pointers for his brothers contributed by this dispenser:

"If you can get up a new sundae or fancy drink give it an appropriate name—not too loud, but suggestive.

"Have your signs neat and where they can be seen.

"To be among the topnotchers you must take an interest in your business; study it, stay with it, be on the lookout for new ideas and they will come to you.

"To make it a financial success always ascertain the cost of a new drink before putting it on.

"Have a leader, a special drink that looks a little nicer and tastes a little better than can be gotten elsewhere.

"Serve the very best material that your trade will justify.

"Always remember that it is easier to hold an old customer than to get a new one."

Cold Drinks for Mid-Winter.

Here are just a half-dozen formulas for drinks and sundaes which will help to popularize the cold soda business even in mid-winter:

Fruits and Flowers.

Grape juice.....	1½ ounces.
Raspberry syrup.....	½ ounce.
Vanilla syrup.....	½ ounce.
Rose syrup.....	½ ounce.
Cracked ice.....	enough.

Mix in a large glass and fill with water from the fine stream.

Come-Again Sundae.

Chop well together equal parts of figs, raisins, marshmallows, citron, and nut kernels. Place ice cream on the sundae plate, pour over it a little chocolate syrup, and garnish with the chopped mixture. An extra touch can be given to this mixture by topping with whipped cream and a cherry or two.

Prohibitionists' Tipple.

Grape juice.....	3 ounces.
Juice of.....	1 lemon.
Egg.....	1 only.
Simple syrup.....	2 ounces.
Cracked ice.....	enough.
Plain water.....	4 ounces.

Mix well in a shaker, strain into a glass, and fill with the fine stream.

Banana Sundae.

Place half of a split banana on a dish of suitable shape and partly cover it with vanilla ice cream. Pour over this some chocolate and syrup, and top with whipped cream, and a sprinkle of chopped nuts.

Cold Malted Egg.

Malted milk.....	enough.
Egg.....	1 only.
Plain cream.....	2 ounces.
Vanilla syrup.....	1 ounce.
Cracked ice.....	enough.

Shake all together, pour into a glass, and fill with the fine stream.

Breath of Spring.

Place ice cream in a sundae dish and pour over it an ounce or two of a mixture of cherry and pineapple syrup, and a little whipped cream. Top with a cherry and a pineapple cube.

A Few Hot Ones.

Below are a few formulas for hot beverages, some of which are original with the CIRCULAR while others have been caught as they flit from journal to journal.

Angelito.

White of.....	1 egg.
Juice of.....	1 lemon.
Powdered sugar.....	3 spoonfuls.

Beat the egg white with the sugar until a good froth is made, then add the lemon juice and enough hot water to fill an 8-ounce mug, stirring continuously.

Clam Bouillon.

Clam juice.....	1 ounce.
Butter.....	½ teaspoonful.
Cream.....	1 teaspoonful.

Place in a mug and fill with boiling water. Sprinkle a little celery salt on the drink and serve with wafers.

Cream of Tomatoes.

Tomato catsup.....	½ ounce.
Cream.....	1 teaspoonful.

Stir together in a mug, and fill with hot water. Top with whipped cream and sprinkle with a little celery salt. Cheese wafers go well with this.

Oyster Malt.

Malted milk.....	2 teaspoonfuls.
Oyster juice.....	1 ounce.

Mix, adding butter and celery salt, and fill the mug with hot water.

Beef and —

Extract of beef.....	½ teaspoonful.
Egg.....	1 only.

Mix in an 8-ounce mug, stir in enough hot water to fill, sprinkle with celery salt and paprika, and serve with cheese wafers.

If three or four people are to be served in a party, and the dispenser completes one drink before the next one is begun, the first of the party served will either have to proceed ahead of his friends, or drink a stale glass of soda. Experienced and careful dispensers put the syrups, cream, etc., in all the glasses, and then rapidly draw and serve the soda water.

The Vanilla Market.

Vanilla flavor is as standard at a soda fountain as flour is in the grocery store. This flavor, as is well known, is made from beans which grow in Mexico and elsewhere. The two principal varieties of beans found in commerce are the Mexican and the Bourbon. As recently as a dozen years ago the Mexican was considered so much superior to the Bourbon that it sold for about two-and-a-half times as much, but from year to year the price of each kind has fallen, that of the Mexican more rapidly than that of the other variety, until now the prices of the two kinds are nearly the same. The table below, showing the range in wholesale prices for vanilla beans for the past twelve years, enables one to see at a glance how prices have fallen and how the difference between the prices of the two varieties has almost been wiped out.

	Mexican Whole Beans, Per pound.		Bourbon Beans, Per pound.	
	High.	Low.	High.	Low.
1899	\$12.00	\$11.00	\$5.00	\$4.00
1900	11.00	9.00	4.50	4.00
1901	9.00	6.75	4.75	3.00
1902	6.75	4.75	3.00	2.50
1903	6.50	5.00	2.50	1.50
1904	5.00	3.75	1.50	1.50
1905	3.50	2.75	1.50	1.00
1906	2.75	2.75	1.50	1.00
1907	4.25	2.75	3.00	1.25
1908	4.25	3.00	3.00	1.50
1909	3.25	2.75	3.00	1.75
1910	3.37½	2.75	3.00	2.75

Mexican cut beans sell for from about 7½ to 15 per cent. less than the Mexican whole beans.

There are said to be half a million pounds of Mexican beans to be marketed before the new crop is gathered, which is just about double the usual annual offering. In the meantime, however, it is thought that the Bourbon beans will cut little figure in the market, so that buyers will not have things entirely their own way.

Small cubes cut from crystallized pineapple make an attractive and toothsome topping for sundaes and some of the heavier drinks.

Smooth Ice-Cream without Gelatin.

In answer to an inquiry from J. D. M., Connecticut, it may be stated that gelatin and the various other fillers used to cheapen ice-cream are not conducive to the smoothness of the product. This quality is the result of proper manipulation—it is of course easier to make a glued-up mixture *stay* smooth, in truth the office of the colloid is to conceal the granulation due to the lactic fermentation in the cream.

The best all-round ice cream for fountain use is "Philadelphia ice-cream," a simple, honest mixture of cream, sugar, flavor, and good work. These are the ingredients:

Cream	2 gallons.
Sugar	3 pounds.
Vanilla beans.....	4 only.

Here is the way to make it:

Select a "double" cream containing one and one-fourth times as much butter fat as the food authorities require in ice-cream; that is, if the butter-fat content standard for ice-cream is 14 per cent. start with a cream, or a mixture of fresh milk and cream, containing not less than 17.5 per cent. of fat. Split the vanilla beans into four sections and cut these into inch lengths; soak the vanilla in the cream for several hours. Gently heat the cream containing the chopped beans until it begins to boil; remove from the heat, and add the sugar, stirring the mixture gently until the sugar is dissolved. Strain the mixture into the can of the freezer and let it cool. Then with an egg whip beat the mixture to a froth; close the freezer, and turn with a steady vigorous motion. Some of the things that produce second- or third-grade ice-cream are the use of poor, soured cream; the use of cheap, dirty, or blued sugar, not completely dissolved; over-done economy of ice and salt; failure to have the ice crushed fine enough; intermittent and slow turning of the freezer; and careless work in general.

Other ice-cream formulas appear in the CIRCULAR for April, 1910, page 177.

Large Profit in Hot Drinks.

Allowing a liberal amount for running expenses and all possible contingencies, there can be realized from the hot soda business, if properly conducted, a profit of from 100 per cent. up. This will vary according to the amount charged per drink, which, says the *Pacific Drug Review*, on the Pacific Coast, at least with the larger of the dispensers, averages 10 cents, whereas, Eastern fountains serve most of the hot drinks at 5 cents each and still make a liberal profit.

There are few businesses that will show a clear profit of 100 per cent. or more with so small an investment and with so little trouble in operating as is required in the hot soda business.

Once a customer stopped patronizing a certain place because the attendants stuck their fingers in the glasses when removing them. A crank? Maybe; but the world is full of cranks.

An Eye-Water Fake.

"Professor" H. Samuels, hailing from and usually holding forth at Wichita, Kan., claimed to be "the only living person" who by means of medicine (specially prepared and priced, likewise supplied by the "perfessor") applied to the eye treats and has cured all sorts of pathological conditions from tuberculosis to the morphine habit. His advertising in the public press heralded the fact that so successful was he in his peculiar system of medicine that he had been arrested time and often at the instigation of envious physicians who charged him with practicing illegally.

Two samples of this "marvelous medicament" (\$25 per ounce) were examined cursorily in the laboratory of the American Medical Association. In a report in the *Journal* of the association the chemists stated that the liquid responded to tests for "sodium chloride, sugar, and a sulphate," but gave no indications of the presence of any metal or alkaloid. Quantitatively they found about 7.5 per cent. each of sugar and salt.

Through the liberality of A. D. Ellis, of East Syracuse, N. Y., a copy of Mrs. Allen's book, "Alcohol a Dangerous and Unnecessary Medicine," has been sent to each medical library in the United States and Canada.

Some Federal Allegations of Sophistication.

Almost 150 additional notices of judgments under the food and drugs act of June 30th, 1906, have been issued by the federal government since the list published in the CIRCULAR for November, last, page 588, was compiled. Such of these as have to do with commodities germane to the retail drug business are summarized below.

Olive Oil.—Donato Maddaloni, of this city, shipped in interstate commerce a consignment of a food product labeled "Olio d'Oliwa, Sopraffino di Sorrento. Marca Masaniello, Pure Olive Oil. This olive oil is imported and canned by Donato Maddaloni, N. Y., U. S. A." Samples analyzed by the government were reported as containing approximately 50 per cent. of cottonseed oil and to be artificially colored. Proceedings were brought against the shipper in the United States court for the southern district of New York, and on a plea of guilty the court imposed a fine of \$25.

A consignment of an oil labeled "San Rocco brand Salad Oil, San Rocco Qualita Sopraffino Marca, San Rocco (a compound) winter pressed cotton oil, flavored with pure Italian Olive Oil, packed in New York in compliance with the United States Pure Food Law, Olio, Marca, San Rocco," was shipped in interstate commerce by the Strohmeier & Arpe Company, of this city. This oil, it was reported by the bureau of chemistry, after the examination of samples, was misbranded because, as it alleged in the United States court for the southern district of New York, the words "San Rocco Brand Salad Oil" were in large type on the label and the words truly descriptive of the contents were in small type not likely to be noticed by the purchaser. The defendant filed a motion to quash this information. This was granted by the court on the ground that the label would not mislead anyone of ordinary intelligence.

A plea of guilty was entered in the United States court for the eastern district of Wisconsin by the Drake Brothers' Company, of Milwaukee, Wis., to a charge of violating the law in shipping in interstate commerce a food product labeled "Superior French Virgin Olive Oil, inspected by the United States government chemist and guaranteed pure. Imported by Drake Brothers Company, Importers, wholesale and retail druggists, Eastwater and Michigan streets, Milwaukee, Wisconsin," which the government alleged was misbranded because the product had never been examined by the "United States government chemist." The defendants were sentenced to pay a fine of \$25.

Jacob Cusimano, Albert J. Cusimano, and Leon Tujague, trading as the Cusimano & Tujague Company, New Orleans, La., shipped in interstate commerce a food product labeled "Olio Pura d'Oliwa Guarantito Torelli Brand Pure Olive Oil." After analysis the bureau of chemistry reported that the product was adulterated in that it contained cottonseed oil, and misbranded in that this fact was not indicated upon the label. The defendants plead guilty in the United States court for the eastern district of Louisiana, which imposed a fine of \$10 and the payment of costs.

Concetta Palma doing business as the Lucca Olive Oil Importing Company, shipped in interstate commerce a consignment of a food product labeled "Olio d'Oliwa Colombo Brand Marca Depositata. Cotton seed oil. Olive Oil. Compound Lucca Olive Oil Importing Company, New York, N. Y." After analysis by the bureau of chemistry, the government alleged that the product was misbranded in that the words "Olio d'Oliwa" and "Olive Oil" appeared on the label in large type, while the words "Cottonseed oil" appeared in small, indistinct type. In the United States court for the southern district of New York, the defendant plead guilty to the charge and the court suspended sentence.

Marchesini Brothers, of this city, shipped in interstate commerce assortments of various sized cans containing a food product. These cans were labeled "Italian Produce superfine olive oil, F. Bertolli, Tuscany, Italy," and the cases containing the cans were labeled "Olive Oil, extra quality, F. Bertolli, Lucca." The bureau of chemistry reported from the examination of samples that the product was adulterated and misbranded in that it consisted in part of cottonseed oil and was not labeled so as to indicate the fact. The United States court for the eastern district of Pennsylvania, in which a label was filed, condemned the product with the proviso that it be delivered to the shippers who appeared as the claimant, upon the payment of costs and the execution of a bond in the sum

of \$400 conditioned that the product should not be sold contrary to the food and drugs act.

Extract of Lemon.—The Hetfield Extract and Manufacturing Company, of this city, shipped in interstate commerce a consignment of a product labeled "Goldenrod Compound Lemon Flavor Compound of oil lemon. Dilo alcohol, Veg. color, Hetfield Ext. & Mfg. Co., New York, N. Y." Samples examined by the government analyst were reported to be adulterated and suit was brought in the United States court for the southern district of New York. It was alleged that the product was a highly diluted solution of citral in methyl alcohol containing practically no oil of lemon, and was colored with a coal-tar dye. The defendant plead guilty to the charges and a fine of \$5 was imposed.

The Symns-Utah Grocery Company, of Salt Lake City, Utah, shipped in interstate commerce a product labeled "Double Strength, Concentrated Extract of Lemon, Symns-Utah Grocery Company, Salt Lake City, Utah." Samples examined by the government analysts were reported to be adulterated and misbranded because they were a dilute terpeneless extract of lemon, artificially colored and containing only a trace of oil of lemon. The defendant entered a plea of guilty in the United States court for the district of Utah, and was sentenced to pay a fine of \$25 with the costs.

A consignment of a food product shipped in interstate commerce by the Hall-Whitney Manufacturing Company, of Binghamton, N. Y., was labeled "Finest quality. E. & E. Trade Mark. Strictly Pure Flavoring Extract of Lemon. Color simulated. Guaranteed under the Food and Drugs Act of June 30, 1906. Serial No. 2959. Distributors Erwin & Eberwine, Evansville, Ind." It was analyzed by the bureau of chemistry and reported to be a dilute extract of lemon. In the resulting proceedings in the United States court for the northern district of New York, the defendant plead guilty and was fined \$100.

A sample of a food product labeled "Star Extract of Lemon, Knoxville Drug Co., Manufacturing Druggists, Knoxville, Tenn.," was taken from a consignment shipped in interstate commerce by the Knoxville Drug Company and examined by government chemists. Their reports indicate that the product was adulterated in that it consisted wholly or in part of a dilute extract of lemon and that it was colored with a coal-tar dye, and misbranded in that the label was not a true indication of the contents of the containers. Suit was brought in the United States court for the eastern district of Tennessee, and the defendant's company, through J. L. Lowe, its manager, submitted to the charges and was sentenced to pay a fine of \$10 with the costs.

Newmark Brothers, of Los Angeles, Cal., shipped in interstate commerce a quantity of a food product labeled "Acme Brand Terpeneless Flavoring Extract Lemon Flavor." Samples from this shipment were analyzed by government chemists and as a result of their findings suit was brought against the company in the United States court for the southern district of California alleging that the product was adulterated in that it contained but one-twentieth of the required amount of citral and that it was colored so as to deceive; further that it was misbranded because the label tended to deceive the purchaser. On a plea of guilty the court imposed a fine of \$1.

A plea of guilty was entered in the United States court for the eastern district of Virginia by the Christian Brothers Company, of Richmond, Va., to a charge of violating the law in shipping in interstate commerce a consignment of a food product labeled "Mammy's Favorite Extracts, Lemon, made by Christian Bros. Co., Richmond, Va." Samples of this product were reported by the government chemists to be adulterated because it contained far less than the required percentage of oil of lemon, and had been artificially colored to conceal its inferiority. The court suspended sentence.

A food product labeled "Dever's Golden West Triple Extract of Lemon" was shipped in interstate commerce by Closset & Devers, of Portland, Ore. Samples were procured by the bureau of chemistry, and after analysis were reported to be adulterated and misbranded in that the product contained no oil of lemon but was an artificially colored terpeneless extract and that the label was calculated to deceive the purchaser. The United States court for the district of Oregon in which the shippers entered a plea of guilty, imposed a fine of \$25 and ordered the defendants to pay the costs.

The C. F. Sauer Company was charged in the United States court for the eastern district of Virginia with violating the law by shipping in interstate commerce a food product alleged to be adulterated and misbranded. This product was labeled "Gold Medal Pure Concentrated Extract of Lemon, Colored, Not Full Strength, Standard Extract Company, New York. (Guaranty Clause) Serial No. 1614." The charge of adulteration was based on the allegation that the extract contained but little oil of lemon. The misbranding was alleged to consist in the statement that it was manufactured in New York, when in fact it was manufactured at Richmond, Va. The defendant plead guilty to the charge of misbranding; the charge of adulteration was nolle prossed; and the court imposed a fine of \$25.

Vanilla Flavoring.—A charge of misbranding was brought in the United States court for the eastern district of Virginia, against the C. F. Sauer Company based on the allegation that a food product shipped by the company in interstate commerce with the label "Gold Medal Pure Concentrated Extract of Vanilla, Standard Extract Company, New York. (Guaranty Clause) Serial No. 1614," had been manufactured at Richmond, Va. The defendant entered a plea of guilty and was sentenced to pay a fine of \$25.

A food product labeled "Vanoleum, Concentrated Vanilla, a compound, Corrizo Extract Company, New York City, U. S. A.," was shipped in interstate commerce by the Corrizo Extract Company of this city. From the analysis of samples by the bureau of chemistry the product was alleged to be misbranded, and a suit was filed in the United States court for the northern district of California, in which it was set forth that the flavor consisted of a mixture of vanillin and coumarin dissolved in alcohol and glycerin and colored with caramel. The manufacturer consented to a decree of condemnation and the court ordered that upon the filing of a bond conditioned that the goods would not be disposed of contrary to the law, and the payment of the costs of the proceedings, the goods be delivered to the claimant.

The Crown Manufacturing Company, of this city, shipped in interstate commerce a food product labeled "Vanilla. Scientifically prepared. Colored with harmless color. Serial No. 4664. Crown Manufacturing Company, New York. St. Louis." Samples were analyzed by the bureau of chemistry, and were reported to be misbranded because the product was labeled in such a manner as to conceal the fact that it was an artificially colored imitation extract of vanilla. A plea of guilty was made by the defendant in the United States court for the southern district of New York, and a fine of \$15 was imposed.

A plea of nolo contendere was made by the Ludlow-Robson Company, Incorporated, of Toledo, Ohio, in the United States court for the northern district of Ohio to a charge of violating the law by shipping in interstate commerce a food product which was declared by the government analysts to be misbranded. The product was labeled "Pen-nant Brand Flavoring Extracts. Imitation Vanilla Flavor, Pure vanilla 20.52, Vanillin 12.00, Coumarin 3.48, Sugar 8.00, Grain Alcohol 12.00, Water 44.00, Caramel color, manufactured by the Ludlow-Robson Company, Toledo, Ohio. Guaranty Serial No. 7310." The analysts reported that the flavor did not contain the ingredients in the amounts stated on the label, but contained "alcohol 8.04, vanillin 0.58, coumarin 0.05, and a small amount of vanilla resins." The court imposed a fine of \$25 with the costs.

"Rexall Headache Wafers."—The United Drug Company of Chicago, Ill., was charged in the United States court for the northern district of Illinois with shipping in violation of the law a drug product labeled "Rexall Headache Wafers," which from the examination of samples taken by government inspectors was declared to be misbranded because of the statement on the package that the product was harmless whereas it contained caffeine and acetphenetidin, both alleged by the government to be harmful and injurious to health, and further that it was stated on the label that the product contained 228 grains of acetphenetidin to each ounce whereas it did contain 339 grains to the ounce. The defendant entered a plea of nolo contendere and was sentenced to pay a fine of \$50.

"Funny-how-quick" Headache "Cure."—The J. Maro Hariman Drug Company, of Lynn, Mass., shipped in interstate commerce a preparation labeled "Funny-how-quick" Headache and Neuralgia Cure. A Sure and Quick Relief for all Headaches and Neuralgia. Contains no opium, morphine or Antipyrine. Does not stupefy but braces one up.

Will not cause a habit. Guaranteed to cure or money refunded. Dose. One tablet and repeat in $\frac{1}{2}$ hour if needed. Manufactured by the 'Funny-how-quick' Company, Box 485, Lynn, Mass. Price 10 cents. Large Box 25 cents. For sale by all Druggists." On the examination of samples taken from this shipment by the bureau of chemistry the product was declared to be misbranded in that the amount of acetanilid was not properly and correctly stated on the label, and that the product was a habit-forming drug. Suit was brought in the United States court for the district of Massachusetts, and the defendant after entering a plea of *nolo contendere* was fined \$25.

Headache Powders.—Proceedings were instituted in the United States court for the district of Massachusetts against J. F. Gearan, of Boston, Mass., in which it was alleged that the defendant had shipped contrary to law two consignments of a drug product labeled "Headache Powders Each Powder contains Acetphenetidin 5 grains with other Pure and Efficient Ingredients. Direction. . . . Price 10 cents. Prepared for J. F. Gearan, Pharmacist. Successor to Chas. Coleman, 48 Cambridge street, cor. Temple, Boston, Mass." These statements on the label were alleged to be false and misleading, because the powders did not each contain 5 grains of acetphenetidin and some of them contained acetanilid. The court imposed a fine of \$25 on a plea of *nolo contendere*.

"Howe's Headache Tablets and Howe's Headache Treatment."—Consignments of drug products shipped in interstate commerce by the Howe Medicine Company, of Philadelphia, Pa., were sampled by the government and examined. The products were labeled "Howe's Headache Tablets" and "Howe's Headache Treatment." In a suit brought in the United States court for the eastern district of Pennsylvania against the company it was alleged that both were misbranded because the labels bore a statement that each tablet contained "in addition to other antidotes one grain of acetanilid," where it was shown by analysis that they each contained two grains of the drug and because the statements on the labels were false and misleading in other respects. On a plea of guilty the company was sentenced to pay a fine of \$50.

"Dr. Peters' Headache Powders."—The Delaware Drug Company, of Hancock, N. Y., shipped in interstate commerce a quantity of a drug product labeled "Dr. Peters' Headache Powders 1 oz. 280 grains phenylacetamide. They will relieve headache, neuralgia, pains in any part of the body in 15 minutes. Guaranteed under the Food and Drug Act of June 30, 1906. Serial No. 1216. Delaware Drug Co., Hancock, N. Y." The government after analysis of samples of the drug alleged that the product was misbranded, because the fact that the product contained acetanilide was not stated on the label. Proceedings were instituted in the United States court for the northern district of New York and resulted in the defendant being fined \$50 on a plea of guilty.

"Sure Pop Headache Powders."—Criminal information was filed against the Sure Pop Company, of Terre Haute, Ind., in the United States court for the district of Indiana charging it with violating the law by shipping in interstate commerce a product labeled "Sure Pop Cures Headache and Neuralgia. . . . Prepared by Sure Pop Company, Terre Haute, Indiana. Price 15 Powders 25 cents. Sure Pop, the Great Nerve. Try it." On the report of the analysis of samples of this product the government alleged that the product was misbranded because the claims of curative worth were false and misleading. The defendant plead guilty and the court imposed a fine of \$25 with costs.

"Mrs. Summers' Harmless Headache Remedy."—Gabriel R. Summers, doing business as Vanderhoof & Co., South Bend, Ind., shipped in interstate commerce a quantity of a drug product labeled "Mrs. Summers' Headache Remedy." Samples were analyzed by the bureau of chemistry, and the drug alleged to be misbranded in that the statement printed on the containers "harmless headache remedy" was false because the product contained caffeine, acetanilide, camphor, and sodium salicylate. In the United States court for the district of Indiana the defendant plead guilty, and a fine of \$10 with costs was imposed by the court.

"Wells' Dime Headache Cure."—A drug product labeled "Wells' Dime Headache Cure. . . . Wells Medicine Company, Lafayette, Indiana," was shipped in interstate commerce by this company. Samples taken from the ship-

ment were analyzed by government chemists and from their finding proceedings were instituted in the United States court for the district of Indiana alleging that the product was misbranded because it was not a cure for headache. The defendant plead guilty and was fined \$10 and ordered to pay the costs.

"Failing's Headache Powder."—The Failing-Nellis Drug Company, of Albany, N. Y., shipped in interstate commerce a quantity of a drug product labeled "Our own headache cure; a safe and efficient remedy for headache, neuralgia, etc. Failing & Company, Albany, N. Y. We guarantee this cure to contain no opium, morphine, antipyrine, bromides, or narcotics and leaves no disagreeable after effect. Failing's headache cure is a harmless and efficient remedy, pleasant, quick, and sure for all sick and nervous headache, etc. It is a guaranteed cure." Samples analyzed by the bureau were alleged to be misbranded because they contained acetanilide of which no mention was made on the label and that the label bore false and misleading statements of curative properties. Proceedings were brought against the company in the United States court for the northern district of New York. The defendant entered a plea of guilty and was fined \$125.

"Dr. Winchell's Teething Syrup."—Proceedings were instituted in the United States court for the northern district of Illinois against the Emmert Proprietary Company, of Chicago, Ill., in which the defendant was alleged to have shipped in interstate commerce in violation of the law, 144 bottles of a drug product labeled "Dr. Winchell's teething syrup, for stomach and bowel troubles during teething; diarrhoea, dysentery, colic, summer complaint, sore mouth and ordinary ailments of children. Emmert Proprietary Company, Chicago, Ill. Guaranteed under the Food and Drugs Act of June 30, 1906. Serial No. 576." Samples from this shipment were examined by the bureau of chemistry and alleged to be misbranded because a circular wrapped around each bottle contained the following statements which the government contended were false and misleading: "The best medicine for the diseases incident to infancy that has ever been given to the world"; "Will positively cure every case if given in time"; "Quiets and soothes all pain"; "Cures diarrhoea, and dysentery in the worst forms"; "Is a certain preventive of diphtheria"; "Cures . . . diphtheria." The defendant first entered a plea of not guilty but later submitted a plea of guilty, whereupon the court imposed a fine of \$25 with costs.

"Mother's Friend."—A preparation labeled "Mother's Friend," shipped in interstate commerce by the Bradfield Regulator Company, of Atlanta, Ga., was, on analysis by the bureau of chemistry, declared to be misbranded because, it was alleged by the government, the preparation was not, as it was claimed on the labels, "The Mother's Friend, for the relief of suffering incident to child birth"; a "remedy upon which confidence could be placed; one that will assist in a safe and quick delivery and one that shortens the duration of labor." Libels were filed in the United States court for the southern district of Georgia which tribunal upon a plea of guilty fined the defendant \$25 and ordered it to pay the costs of prosecution.

"Radam's Microbe Killer."—The federal government instituted libel proceedings in the United States court for the western district of Washington charging the misbranding of twenty-five cases of a drug product shipped in interstate commerce with the label: "William Radams Microbe Killer, kills all diseases. Serial No. 6675." The unit packages in the cases bore the following statements: "It is a positive and certain cure for all diseases and is guaranteed to be perfectly harmless. It will effect a cure in every instance if given a fair trial." "Cures by removing the cause—microbes," "Microbe Killer is perfectly harmless and can be taken in any quantity without danger," and blown in the bottle was the statement: "Cures all diseases." The Radams Microbe Killer Company appeared by attorney and admitted the allegations contained in the libel and the court decreed the condemnation of the product and ordered that it be forfeited, with the proviso that upon the payment of costs and the execution and delivery of a bond in the sum of \$500 conditioned that the product would not be disposed of contrary to the law, the consignment should be released to the claimant. The claimant failed to pay the costs within the time provided and the court ordered the marshal of the district to destroy the twenty-five cases of the preparation.

Cancer Cure.—A. J. Miller, of St. Louis, Mo., shipped in interstate commerce two boxes of an ointment sold as a

cancer cure. The government in a suit in the U. S. court for the eastern district of Missouri alleged that the product was misbranded in that it contained 31.8 per cent. of acetanilide about which the label failed to bear any statement. The defendant plead guilty and was sentenced to pay a fine of \$25 and the costs.

"Cancerol."—Leon T. Leach, of Indianapolis, Ind., shipped in interstate commerce a product labeled "Cancerol, a compound of essential oils for the treatment of malignant diseases, originated and perfected by L. T. Leach, M. D. Blood renovator. Predigested oils for internal administration. This preparation tones up the general system, enriches the blood and fortifies the glands against invasion of malignant cells. It does not injure the most delicate stomach, etc. Directions: Take one teaspoonful before each meal with or without water. From the Parkview Sanitorium and Dispensary, Dr. L. T. Leach, Medical Director, Indianapolis, Ind." Along with this was a salve labeled "Healing salve, composed of a due mixture of vegetable and mineral oils, with certain drugs of highly healing qualities. . . ." Samples were analyzed by the bureau of chemistry, and were alleged to be misbranded in a suit filed in the United States court for the district of Indiana because the product in the bottle was not essential oils or predigested oils but that it contained 14 per cent. alcohol and a certain proportion of opium which fact the label failed to indicate. It was also alleged that the salve was not a compound of vegetable oils with certain drugs with healing properties as stated on the label. The defendant entered a plea of not guilty for which was later substituted a plea of guilty and the court imposed a fine of \$25 with costs.

"Soemnoform."—A product was shipped in interstate commerce by Jacob F. Frantz, George H. Whitely, Dean C. Osborne, and John R. Sheppard, trading as E. De Trey & Sons, Philadelphia, Pa., labeled "Soemnoform. This mixture contains chloride of ethyl 60%, chloride of methyl 35%, bromide of ethyl 5% Guaranteed under the Food and Drugs Act of June 30, 1906. Serial No. 5700. . . ." It was analyzed by the government. As a result criminal information was filed in the United States court for the eastern district of Pennsylvania against E. De Trey & Sons charging that the product was adulterated and misbranded in violation of the law because it did not contain "bromide of ethyl 5%," or any bromide of ethyl. The defendants entered a plea of guilty and a fine of \$25 was imposed.

Cocaine.—Proceedings were instituted in the United States court for the district of Indiana against Charles Crescellus, of New Albany, Ind., charging that he shipped in violation of the law a quantity of a drug sold as from cocaine. Samples had been examined by the bureau of chemistry and the product was alleged to be misbranded because it consisted of 80.34 per cent. of acetanilide and 19.64 per cent. of cocaine hydrochloride, and because the labels failed to bear any statement as to the proportion of acetanilide or cocaine contained therein. On a plea of guilty the defendant was ordered to pay a fine of \$10 and the costs.

Hamamelis Water.—A. J. Hilbert & Co., of Milwaukee, Wis., shipped in interstate commerce a product labeled "Distilled Extract of Witch Hazel (Hamamelis). Dr. Scott Medicine Co., Milwaukee, Wis.," and "For bleeding piles, blind piles, toothache, earache, sore throat, sore eyes, sore navels, bleeding lungs, insect stings, neuralgia, etc., for rheumatism, burns, scalds, bruises, kidney diseases, sprains, wounds, ulcers, lame back, frozen limbs, sore feet and corns." Samples were analyzed by government chemists. The product was declared to be misbranded in that the amount of alcohol it contained, 14.15 per cent., was not indicated on the labels and that the product was not a valuable remedy for the treatment of all the affections set forth on the label. The United States court for the eastern district of Wisconsin, on a plea of guilty, fined the defendant \$25.

"Elixir of Cod Liver Oil."—A drug product shipped in interstate commerce by Frederick F. Ingram & Co., of Detroit, Mich., was labeled "Our Compound Elixir of Cod Liver Oil. The active and medicinal principles of Cod Liver Oil, Morrhual, Butylamine, Amylamine, Iodine, Bromine and Phosphorous, combined with Fl. Extract Wild Cherry Bark, and the Hypophosphites of Sodium, Calcium, Potassium, Manganese, Iron, Quinine and Strychnine. . . . Distributed by the People's Pharmacy, M.

G. Gibbs, Mgr., 824 Seventh St., N. W., Washington, D. C." It was examined by government analysts and upon their report declared to be misbranded. Proceedings were instituted in the United States court for the eastern district of Michigan, alleging that the product was misbranded in that the statements on the labels were false and misleading because analysis failed to reveal any cod liver oil or medicinal principles thereof, and because the preparation did not replace with advantage cod liver oil emulsion as was stated on the label. The defendant entered a plea of nolo contendere and the court imposed a fine of \$5.

Blackberry Cordial.—A product labeled "H. F. L. Hamilton Blackberry Cordial, artificially colored, guaranteed under the Food and Drugs Act, Serial No. 3999-X. Henry H. Shufeldt & Company, Rectifiers and Wholesale liquor dealers, Apple Street, Peoria, Ill. Blackberry Cordial," was shipped in interstate commerce by Henry H. Shufeldt & Co., of Peoria. Chemists of the bureau reported that the product was not true to label. Libel proceedings were instituted in the United States court for the eastern district of Pennsylvania in which it was alleged that the product was adulterated and misbranded consisting "wholly or in part of a fermented solution of starch sugar artificially colored and flavored" which did not correspond in any particular to the blackberry cordial recognized by the National Formulary. It was also alleged that the presence of alcohol was not indicated on the labels. H. H. Shufeldt & Co., appeared as the claimant and consented to the libel, denying any intention to transgress the law. The court ordered that the goods be returned to the claimant upon the filing of a bond for \$400 conditioned that they should not be disposed of contrary to the law.

"Allen's Red Tame Cherry."—A plea of nolo contendere was entered in the United States court for the northern district of Ohio by the Lima Fruit Juice Company, of Lima, Ohio, charged with shipping in interstate commerce in violation of the law, a product labeled "Drink Allen's Red Tame Cherry—Refreshing, delicious, cooling—Artificially colored—not a wild cherry—The Lima Fruit Juice Company, Lima, Ohio." A sample having been analyzed by the bureau of chemistry the government alleged that the product was adulterated and misbranded in that "an artificial syrup was substituted wholly or in part for the genuine product as labeled" and in that the product was artificially colored to conceal inferiority and labeled so as to deceive the purchaser. The court imposed a fine of \$25 with costs.

"Wiseola."—The Wiseola Company, of Birmingham, Ala., shipped in interstate commerce a product labeled "Wiseola," which, upon being analyzed by the bureau of chemistry, was declared to be misbranded. Proceedings were instituted in the United States court for the northern district of Alabama alleging that the product contained cocaine the proportion of which was not indicated on the label. The defendant plead guilty and was sentenced to pay a fine of \$25 and the costs.

Silver Dragees.—On January 13th, 1910, the French Silver Dragee Company, of this city, was sentenced to pay a fine of \$100 by the United States court for the southern district of New York on a charge of shipping contrary to law a confectionery known as silver dragees which were alleged to be adulterated because they were coated with metallic silver. The defendant appealed from this judgment, which was reviewed on a writ of error by the United States circuit court of appeals for the second circuit. The judgment of the trial court was reversed, the appellate court ruling that it was not proven that silver coating of dragees in any way deceived the public or was injurious to health.

Solution of Hydrogen Dioxide.—John W. James doing business as Towns & James, of this city, shipped in interstate commerce a drug product labeled "U. S. P. H₂O₂, peroxide of Hydrogen. 3% Hydrogen Dioxide. Aq. Hydrogenii Dioxide, U. S. P. warranted to be of full U. S. P. strength and purity. . . ." A sample was analyzed by the bureau of chemistry and declared to be misbranded in that the label did not indicate that acetanilide was present. In the proceedings which were instituted in the United States court for the eastern district of New York the defendant filed a plea in bar of the criminal information setting forth that he had purchased the product from John Bene, a chemist, of Brooklyn, N. Y., from whom he could establish a guarantee. The court overruled the gov-

ernment's demurrer to this plea and dismissed the information.

Spirit of Camphor.—The bureau of chemistry reported that a drug product shipped by the Dow & Snell Company, of Toledo, Ohio, in interstate commerce with the label: "Triumph Brand, Pure Spirits of Camphor, manufactured by the Dow and Snell Company, Toledo," did not comply with the official standard. Proceedings were instituted in the United States court for the northern district of Ohio alleging that the product was therefore adulterated and was misbranded because the true strength was not stated on the label, neither was the presence of alcohol stated on the label. The defendant entered a plea of nolo contendere and was sentenced to pay a fine of \$25 and costs.

Oil of Turpentine.—A consignment of a drug product labeled "Crescent brand spirits of turpentine. Guaranteed by Gulf Manufacturing Company, Ltd., under the Food and Drugs Act of June 30, 1906, Gulf Manufacturing Company, Ltd., New Orleans, La.," was shipped in interstate commerce by the Gulf Manufacturing Company, of New Orleans. Samples analyzed by the bureau of chemistry were reported to be adulterated. Proceedings were instituted in the United States court for the eastern district of Louisiana where it was charged that the product was adulterated in that a mineral oil was present. It was also charged that the product was misbranded in that the label conveyed the impression that the product was oil of turpentine. The defendant plead guilty and was sentenced to pay a fine of \$10 and the costs.

Asafetida.—Albert Bruen, William P. Ritchey, and Charles C. Bruen doing business under the firm name of Bruen, Ritchey & Co., of this city, shipped in interstate commerce a drug product labeled "Gum Asafetida (Foetida ferula) 1 pound Bruen, Ritchey & Co., New York. Guaranteed under the Food and Drugs Act, June 30, 1906, Serial No. 1063." Samples were analyzed by the bureau of chemistry and following its report proceeding were filed against the company in the United States court for the southern district of New York charging that the product was misbranded in that the label did not indicate that the product contained much foreign material as was reported by the analysts. A plea of guilty was entered by the defendant, and the court imposed a fine of \$50.

Powdered Tragacanth.—The National Aniline and Chemical Company, of Brooklyn, N. Y., shipped in interstate commerce a product labeled "Powdered Gum Tragacanth" which upon analysis by the bureau of chemistry was alleged to be adulterated and misbranded in that it did not comply with the requirements of the United States Pharmacopoeia, and to be misbranded in that it was not tragacanth but a different article, "Powdered Indian Gum." The defendant plead guilty in the United States court for the eastern district of New York, and was fined \$25.

Explanation from Dr. Munyon.

Referring to the note in last month's CIRCULAR, page 45, regarding a plea of guilty and a maximum fine for misbranding certain Munyon remedies, Dr. Munyon writes that the plea was a technical one only, and that his house had always endeavored to live up to the letter and spirit of the food and drugs act.

It is doubtful whether an ordinary chemical examination would reveal the presence of medication in certain homoeopathic pellets. Dr. Munyon says that if his remedies contain no remedial value, then the trouble is with Hahnemann's system.

Some Sophistications in Massachusetts.

In recent bulletins of the Massachusetts Board of Health the following preparations were reported as "adulterated or improperly labeled" for the reasons stated in each case:

Az-ma-syde, made by the Asthma Remedy and Manufacturing Company, of Cornelia, Ga.; "contained cocaine."

Az-ma-syde capsules, made by the Asthma Remedy and Manufacturing Company, of Cornelia, Ga.; "contained acetanilide."

Clayton & Russell's standard wild cherry cordial, made by Adams & Co., of New York; "contained 18.88 per cent. of alcohol by volume."

Cholera mixture, made by Norris, Druggist of Boston; "contained 56.4 per cent. of alcohol by volume."

Coleman's pure extract of lemon, made by the Cole-

man Specialty Company, of Boston; "no oil of lemon present."

Equalizing drops, made by the Drs. Carpenter, of Lowell; "contained 60.1 per cent. of alcohol by volume."

Highland malt extract, made by the Springfield Breweries Company, of Springfield, Mass., "contained 6.71 per cent. of alcohol by volume."

Sun cholera mixture, made by the Markell Weston Drug Company (no address); "contained 19.28 per cent. of alcohol by volume."

Torelli pure olive oil, olio puro d'oliva garantito (no maker's name given); "cottonseed oil."

Vino de quina y cacao, made by Gutierrez Brothers, of Jerez; "contained 18.03 per cent. of alcohol by volume."

Public Health Legislation Offered.

A compromise measure designed to extend the scope of the public health and marine-hospital service and give to the greater bureau the name of the public health service was introduced in congress some weeks ago by Congressman Mann, of Illinois. This bill is in a way intended to take the place of the Owen bill of last year, to create a department of public health. The fate of such a measure is entirely conjectural; although the house committee seemingly favors the Mann bill there is some doubt of its being reported because the senate is apathetic with regard to the subject of public health.

It is stated that the American Medical Association is not satisfied with this measure as a substitute for the farther-reaching Owen bill; the representatives of the association, it is expected, will prepare a draft of a similar measure embodying its views. As was to be expected, the greater part of the objection offered at the hearings on the bill came from the National League of Medical Freedom, its representatives, losing sight of the rights granted under the constitution to the sovereign States and individual citizens have been quite indignant at what they call an attempt to force government-made medical practice into the very homes of the people. Anti-vaccinationists, religious scientists, homeopaths, and osteopaths have also appeared in opposition to the bill.

Medical "Freedom" and the Proposed National Bureau of Health.

The following letter, from Senator R. S. Owen, says the *Bulletin of the Committee of One Hundred on National Health*, should forever silence the charge that the Senator's bill for a national department of health will interfere with "medical freedom":

Answering the clipping sent me from the Cambridge Tribune, denouncing the department of health as pernicious, I reply that senate bill 6049, introduced by me, will not restrict the practice of medicine, will not interfere with the osteopath, the eclectic or any other school of medicine, will not interfere with the right of the individual to choose his own physician or interfere with anybody's medical freedom.

This argument is undoubtedly made by the "patent" medicine men who are engaged in promoting drug habits in the United States for the base purpose of making money, and dread governmental interference.

The United States could have nothing to do with controlling the licenses to practice medicine. Every school of medicine has more or less merit and no school of medicine should be permitted to dominate other schools of medicine and no school of medicine will be permitted to dominate the national department of health.

The department is needed to make more energetic national and international quarantine to prevent the pollution of interstate streams, and the protection of the public health through the constitutional agencies of the United States, strictly construed.

Prof. Clark Succeeds Prof. Hallberg.

Prof. A. H. Clark, of Chicago, has been elected to fill the vacancy on the pharmacopoeial committee of revision occasioned by the death of Prof. Hallberg. Prof. Clark is one of the younger leaders in pharmacy and is the present chairman of the scientific section of the American Pharmaceutical Association. He is a member of the faculty of the school of pharmacy of the University of Illinois.

J. W. T. Knox, who has been with Frederick Stearns & Co., for the past fifteen years or so, as editor of the *New Idea*, and in charge of their publicity department for a good portion of that time, has resigned and joined the force of Chester Kent & Co., of Boston. Mr. Knox is one of the best workers and most accomplished publicity men in the drug business, and will give a good account of himself wherever he may be.

Federal Regulation of the Traffic in Narcotics.

In his annual message to congress transmitted December 7th, 1909, President Taft recommended that "the manufacture, sale and use of opium and its derivatives in the United States should be, so far as possible, more rigorously controlled by legislation." In a subsequent message (February 21st, 1910) the president approved the suggestion that this country participate in the proposed international opium conference. In a special message transmitted January 6th, the president concurred in several recommendations made by the secretary of state relative to the desirability of adding to the effectiveness of the opium exclusion act, of enacting federal control of interstate commerce in habit-forming drugs, and of restricting the exportation of opium, morphine and cocaine under the international opium treaties. In view of this position of the chief executive and the public sentiment aroused by the investigations made under the auspices of the American delegates to the International Opium Commission, the introduction of measures designed to correct the narcotic evil was, naturally, to be expected. Four such measures have been offered in the house of representatives. Interest pharmacal, popular and congressional is centered in the one introduced by Mr. Foster, of Vermont, and known as H. R. 25241. It reads as follows:

A BILL.

Imposing a tax upon and regulating the production, manufacture and distribution of certain habit-forming drugs.

Be it enacted by the senate and house of representatives of the United States of America in congress assembled, That every person who imports, exports, produces, or manufactures opium, morphia, coca leaves, cocaine, alpha- and beta-eucaine, chloral, cannabis, their salts, derivatives or preparations, and every person who further manufactures, compounds, deals in or distributes the aforesaid drugs, or either of them, shall register with the collector of internal revenue of the district his name or style, place of residence and place where such business is to be carried on, and at the time of such registry, and on or before the first day of July in each year, every importer, exporter, producer, manufacturer, wholesaler manufacturing pharmacist, wholesale dealer or jobber shall pay to said collector a special tax at the rate of ten dollars per annum, and every retailer or distributor at retail shall pay to the said collector a special tax at the rate of one dollar per annum. That the word "person," as used in this act, shall be construed to mean and include a partnership, association, company or corporation, as well as a natural person; and all provisions of existing law relating to special taxes, so far as applicable, including the provisions of section thirty-two hundred and forty of the revised statutes of the United States, are hereby extended to the special tax herein imposed.

Sec. 2. That there shall be levied and collected upon all of the aforesaid original drugs, to wit, opium, chloral, cannabis and coca leaves now held by any such person, or hereafter produced or received, an internal revenue tax of 5 cents per pound or fraction of a pound on opium, chloral and cannabis, and 1 cent per pound or fraction of a pound on coca leaves, and said tax shall be paid by affixing to each package or other receptacle containing such original drugs, before removal of the same from a customs warehouse, their place of manufacture or storage, and before being offered for sale an engraved stamp to be affixed and canceled in such manner as the commissioner of internal revenue, with the approval of the secretary of the treasury may prescribe. That all provisions of existing law relating to internal revenue stamps, including all penalties imposed for the re-use of such stamps, so far as applicable, are hereby extended to the stamps provided for in this act, and all such original drugs and all packages and receptacles containing the same not stamped as herein provided shall be forfeited to the United States and may be sold, subject to the provisions of existing law, to any person who has paid the special tax imposed by this act: Provided, That where such original drugs after payment of the tax thereon, are further manufactured or compounded by any duly registered and bonded manufacturing chemist or manufacturing pharmacist, the packages or receptacles containing the same may, under regulations to be prescribed by the commissioner of internal revenue, with the approval of the secretary of the treasury, have affixed thereto, in lieu of the prescribed tax-paid stamps, such labels or marks as will show the payment of the tax on the original drugs before the same were further manufactured or compounded. And every person making application to register under the provisions of this act shall file with his application or registry a sworn statement showing to the best of his knowledge and belief the number of pounds of the aforesaid original drugs, whether such drugs are in their original shape or in preparation, in his possession at the date this act goes into effect, and the collector with whom such application is filed shall collect the tax on such original drugs at the rate of taxation as provided for in this section.

Sec. 3. That every person importing, exporting, manufacturing, remanufacturing, compounding or offering for sale any such drugs, their salts, derivatives or preparations shall keep such books, render such returns and give such bonds as the commissioner of internal revenue, with the approval of the secretary of the treasury, may from time to time prescribe.

Sec. 4. That it shall be unlawful for any person to send or transport in interstate commerce any of the aforesaid drugs, or any of their salts, derivatives or preparations, to any person other than a person who has registered and paid the special tax as required by section one of this act, or for any person to receive, in interstate commerce, any of the aforesaid drugs

or any of their salts, derivatives or preparations, other than a person who is registered and has paid the special tax as required by section one of this act; but nothing contained in this section shall apply to public hospitals or to public or scientific institutions.

Sec. 5. That under such regulations, and upon the filing of such notices, entries and bonds as the commissioner of internal revenue, with the approval of the secretary of the treasury, may prescribe, any of the aforesaid drugs, their salts, derivatives or preparations may be removed from a customs warehouse or from the place of manufacture or storage for export, free of the revenue taxes imposed by section two of this act; but upon the re-importation of any such drugs, their salts, derivatives or preparations, the same shall be held in the custody of the collector of customs until the required internal revenue stamps in payment of the tax and labels and marks imposed by this act have been placed thereon.

Sec. 6. That any person who purchases, receives or sells, transfers or gives away any of the aforesaid drugs, their salts, derivatives or preparations on which the taxes have not been paid or to which the labels or marks imposed by this act have not been affixed, or who violates or fails to comply with any of the requirements of this act, or any regulation issued thereunder, shall, on conviction, be fined not less than five hundred nor more than five thousand dollars or be imprisoned not less than one year nor more than five years, or both, in the discretion of the court.

Sec. 7. That whenever on trial for a violation of this act the defendant is shown to have or to have had possession of the aforesaid drugs, salts, derivatives or preparations thereof in violation of the meaning of this act, such possession shall be deemed sufficient evidence of such violation unless the defendant shall explain the possession to the satisfaction of the jury.

Sec. 8. That all returns required by this act shall be properly filed and recorded in the office of the commissioner of internal revenue and under such regulations as the commissioner of internal revenue, with the approval of the secretary of the treasury, may make. These returns shall be open to inspection and certified copies furnished to the proper officials of any State or Territory or district, or other territory under the jurisdiction of the United States, or any organized municipality thereof, any or all of whom shall be charged with the enforcement of State, district, Territorial, municipal or other local laws or ordinances regulating the prescribing, dispensing, sale or use of the aforesaid drugs, their salts, derivatives or preparations.

Sec. 9. That the sum of one hundred and fifty thousand dollars, or so much thereof as may be necessary, be, and hereby is, appropriated for the purpose of carrying into effect the provisions of this act, and the commissioner of internal revenue is authorized to appoint such agents, deputy collectors, inspectors, chemists, assistant chemists, clerks and messengers in the field and in the bureau of internal revenue as may be necessary to enforce the provisions hereof.

Sec. 10. That all laws relating to the assessment, collection, remission and refunding of internal revenue taxes, so far as applicable to and not inconsistent with the provisions of this act, are hereby extended and made applicable to the taxes imposed by this act.

Sec. 11. That nothing in this act shall be construed as modifying or revoking any of the provisions of the act of congress approved June thirtieth, nineteen hundred and six, known as the "Pure food and drugs act," or any amendments thereof, or of the act approved February ninth, nineteen hundred and nine, entitled, "An act to prohibit the importation and use of opium for other than medicinal purposes."

Two hearings have been held on this bill by the house committee on ways and means which has also conferred regarding the measure with the commissioner of internal revenue and Hamilton Wright, delegate to the International Opium Commission.

The first hearing occurred December 14th. Dr. W. Jay Schieffelin, of this city, president of the National Wholesale Druggists' Association and a prominent member of several anti-narcotic organizations was the first to address the committee. Dr. Schieffelin spoke in favor of the principles of the bill, but made several suggestions whereby he thought its phraseology would be improved and its provisions made less burdensome. One of these suggestions was that licensed dealers be given a numbered stamp so that wholesalers would know that on orders bearing the imprint of such a stamp the desired proscribed drugs might legally be supplied. He thought that errors might easily arise if the wholesalers were obliged to consult a list furnished by the revenue department, every time they received an order for one of the proscribed drugs. Another matter which to him seemed to need attention was that of unintentional violations. In this connection he suggested that the references to violations in the bill be qualified by the insertion of the word "knowingly." Dr. Schieffelin was of the opinion that most of the drug trade favored some provision to exempt from the application of the act preparations containing not more than a minimum proportion of a proscribed drug, but he did not personally favor such exemption.

Christopher Koch, of Philadelphia, vice-president of the Pennsylvania Board of Pharmacy and the leading figure in its war against the illegal sale of narcotics, gave a lengthy recital of the extent to which the drug habits prevail and the resulting conditions (see page 71). He

suggested that preparations containing not more than a minimum proportion of a proscribed drug be exempted from the provisions of the law. To require all violations to have been "knowingly" committed, he declared, would be to vitiate the purpose of the act.

Mr. Wright corroborated many of the statistical figures presented by Mr. Koch.

W. S. Richardson, of Washington, chairman of the committee on national legislation of the National Association of Retail Druggists, appeared in support of the measure considering it a necessary supplement to State laws. In the course of his remarks he presented the anti-narcotic resolutions adopted by the N. A. R. D. at the Pittsburg convention.

At the second hearing, held January 11th, C. A. West, chairman of the committee on legislation of the N. W. D. A., endorsing the purposes of the bill, asked that instead of requiring a stamp to be affixed to every container of a preparation containing a proscribed drug, a plan of serial-number identification be arranged. He was of the opinion that it would be desirable to limit the application of the measure to opium and coca and their derivatives. Mr. West also favored the qualification of references to violations by the insertion of the word "knowingly," and a change from a fixed fine of not less than \$500 to a fine in amount at the discretion of the court.

Mr. West's argument was supplemented by Dr. Schieffelin, who favored the serial number plan in preference to stamps. He asked specifically that the provisions of the measure apply to narcotic medicaments for infants.

A determined protest against the enactment of the bill in its present form was made by H. P. Hynson, of Baltimore, chairman of the committee on national legislation of the American Pharmaceutical Association. He urged that the proscriptions of the measure should be extended to apply to the synthetic substitutes for cocaine and the like, including alypin, novocaine, and holocaine. He further suggested that it would be very desirable to mention the trade-mark names of such derivatives as diacetyl morphine. Mr. Hynson stated that it was practically impossible to separate satisfactorily and effectively sellers and handlers of drugs into wholesale and retail classes as provided, the lines between them being in nearly all cases imperceptible. He thought that it would be wise to have only one class of registered dealers under the act, each paying a uniform fee, and that the bond of each should be proportioned to the amount of the drugs handled. He considered the bill faulty in the provision which requires special tax to be paid upon crude products and allows alkaloids and alkaloidal salts, that are separated and made from these crude drugs, to be imported free from the special tax and entirely without control. In his opinion the full privileges of the act should be extended to every person complying with the registration requirements and not only to manufacturers. The prohibition of interstate traffic in the proscribed drugs except between licensed persons he regarded as unwise as he considered that this would make it almost impossible for persons living near the boundaries of the States or temporarily in another State to secure needed medicines. He thought that some provision should be made for the recognition of physicians' prescriptions in such contingencies.

William Muir, of Brooklyn, severely criticised the general idea of the bill, and declared that it would not in any degree lessen the sale of habit-forming drugs, but practically amounted to a license for such sales and would result in increased difficulties and troubles for the retail pharmacists.

Testimony was given by several druggists and physicians against the provision of the bill, which exempts hospitals and public institutions. It was held that the license fee proposed is merely nominal and that it should be paid by all who handled habit-forming drugs in order that the best possible safeguard be thrown around their distribution.

C. B. Towne, of New York, declared that not one of the drugs proscribed in the measure should be eliminated, but that others should be added. He denounced the present conditions whereby anybody anywhere can obtain opium and morphine in wholesale quantities from even some reputable dealers, and hypodermic apparatus can be obtained without question from similar sources. Mr. Towne declared that the law should be so changed as to prevent the sale of any of these habit-forming drugs except upon a physician's prescription, and that no such prescription should be allowed to be refilled. Similar testimony was given by Dr. Alexander Lambert, of New York, who stated

that all of the drugs mentioned in the law are habit-forming.

Others heard were Mr. Woodruff an attorney representing several manufacturing firms, Donald McKesson, Albert Plaut, and T. P. Cook, all of this city.

Dr. H. W. Wiley argued for a most drastic law against habit-forming drugs. The sale of caffeine-containing drinks at soda fountains came in for a deal of condemnation by Dr. Wiley and Dr. L. F. Kebler.

The consensus of opinion is that the bill, perhaps slightly modified in phraseology, will be favorably reported by the committee.

When interviewed recently in connection with this anti-narcotic movement Dr. Wiley declared that the large number of drug habitués is due to the prescribing of harmful drugs by physicians when not necessary. He says that a physician should never prescribe opium or morphine unless it is for the purpose of saving a life. When a drug is given for some trivial illness, he continued, the odds are strong that the patient will continue to take the drug, and will finally become a slave to the habit. A physician who thus puts a patient in the grip of this terrible habit, he declared, has no right to practice his profession, and the indiscriminate prescribing of narcotics should be punishable by law.

Dr. Wiley attacked the claims of many of the so-called drug cures by saying that it is impossible to cure a person of the drug habit. The list is always growing, he said, and will never decrease unless drastic steps are taken to prevent the sale of drugs. Once a person gets the drug habit he never stops until he becomes a moral and physical wreck and finally dies. Dr. Wiley blames the physicians more than any other class for the growth of the drug habit.

As the first step toward stopping the spread of the drug habit, Dr. Wiley recommended a law requiring druggists to keep a record of all narcotics sold, which shall be made public. Once the amount sold is determined, with the use to which the drugs are put, he believes that the government will be in a position to fight the evil because one of the chief reasons for the spread of the drug habit is the fact that the gravity of the situation is kept secret. Dr. Wiley compared the misuse of drugs to the carrying of concealed weapons, and thought that, if light is thrown on the situation, public sentiment will be so aroused that steps will be taken to wipe out the traffic in drugs.

Pharmaceutical Chemists Meet.

The division of pharmaceutical chemistry of the American Chemical Society held its annual meeting at Minneapolis, December 29th, with Prof. A. B. Stevens, of Ann Arbor, in the chair. The annual address of the chairman who is a member of the pharmacopœial committee of revision was upon the timely subject of "Pharmacopœial Standardization." In it the work of the sub-committee on proximate assays was set forth at length.

In a preliminary report the committee on quantitative methods gave a summary of the results obtained in the analysis of mercury salts by the four members, using six processes. The committee was continued.

During the meeting the following papers were read: "Citro Compounds of Iron," by A. B. Stevens; "Camphor in Oil of Sassafras," by E. R. Miller and G. H. Marsh; "Assay of Gelsemium," by L. E. Sayre; "Rapid Determination of Sulphuric Acid with the Porous Clay Crucible," by F. Klein; and "Chemical Problems Suggested by the Cultivation of Medicinal Plants: Stramonium," by Edward Kremers.

Officers were elected as follows: Chairman, B. L. Murray; vice-chairman, A. D. Thorburn; secretary, F. R. Eldred; members of the executive committee, A. B. Stevens and L. F. Kebler.

American Chemical Society Election.

Coincidental with the annual convention of the American Association for the Advancement of Science, the council of the American Chemical Society met at Minneapolis during the last week in December. The council elected the following officers for the society: President, Prof. Alexander Smith, of Illinois; secretary, Prof. C. L. Parsons, of New Hampshire; treasurer, A. P. Hallock, of New York; editor of the *Journal of the society*, Prof. W. A. Noyes, of Illinois; editor of the *Abstract Journal*, Prof. A. M. Patterson, of Ohio; and editor of the *Journal of Industrial and Engineering Chemistry*, Prof. M. C. Whitaker, of New York.

Meetings of American Pharmaceutical Association Branches.

Baltimore.—The annual meeting of the Baltimore branch of the American Pharmaceutical Association was held January 19th. Reports from the officers and committees occupied the greater part of the meeting.

Secretary and Treasurer E. F. Kelly reported a gratifying increase in membership during the year, and said that the financial condition of the branch was excellent.

Although the chairman of the committee on professional relations, J. F. Hancock, was prevented by illness from being present, the plans of the committee for a joint meeting with the physicians of the city were discussed. The project met with universal approval.

Mr. H. P. Hynson read a communication from the council of the parent association in reference to the collection of a fund to be used as a memorial to the late Prof. C. S. N. Hallberg. Mr. Hynson paid a tribute to Prof. Hallberg's great work for American pharmacy and explained the purpose of the fund. This matter was further discussed by Messrs. Thomas, Hancock, and Meyers, and the proposition was heartily endorsed by the branch.

J. F. Hancock, J. B. Thomas, and Louis Schultze were appointed a committee to prepare memorial resolutions for Louis Dohme and E. E. Quandt, lately deceased members.

The election of officers resulted in the choice of the following: President, C. L. Meyer; vice-president, J. E. Hancock; secretary and treasurer, E. F. Kelly; committee chairmen: Science and practice of pharmacy, J. C. Wolf; membership, H. A. B. Dunning; education and legislation, E. W. Hodson; and professional relations, J. F. Hancock. The branch will next meet February 16th.

Chicago.—Specific anti-parasitic medication was the subject of the discussion at the meeting of the Chicago branch of the American Pharmaceutical Association held December 20th. The subject was introduced in a paper by Dr. Bernard Fantus entitled "Recent Advances in Specific Anti-Parasitic Medication Including Ehrlich's '606'."

Dr. Fantus called attention to the analogy in action between several anti-parasitic remedies commencing with quinine as used in malaria. He contrasted the quinine treatment of malaria with the mercurial treatment of syphilis, saying that it is impossible to use enough mercury to do more than inhibit the growth of the spirocheta pallida, hence the limitations of mercurial treatment. Comparison was made also with the use of salicylates in rheumatism. Dr. Fantus said that rheumatism can positively be checked by heavy doses of salicylates if given at the onset of the disease, while if smaller doses are given an immunity to the drug is established and the treatment thereby made much more difficult. In all of these cases said the doctor there is great danger in treatment by inexperienced and incompetent persons. He considered the treatment of venereal diseases by pharmacists as exceedingly harmful.

The speaker then discussed in a general way the anti-toxins, bacterins and vaccines, and after dwelling upon the disease known as trypanosomiasis, he discussed Ehrlich's "606." Incidentally, Dr. Fantus regarded with disfavor the way of designating this remedy by a number, saying that it reminded him of a certain nostrum. He was glad to find that the new name of salvarsan had been adopted.

Dr. F. G. Harris, introduced by Dr. Fantus, described the appearance of salvarsan and how it was put up, and discussed the methods of using it. He deprecated the extravagant claims which have been made in the lay press for this remedy, saying that probably not more than 30 per cent. of syphilitic cases are curable, and that the great advantage of salvarsan is in the rapidity with which the lesions disappear after treatment.

Dr. A. W. Stillians was then introduced by Dr. Fantus as one who had recently visited Germany and had experience first-hand with the use of this remedy. Dr. Stillians discussed the advantages and disadvantages of the drug and the method of employing it.

Prof. Puckner said that Dr. Hilpert of the American Medical Association chemical laboratory had recently examined a sample of "606," which was put up in a sealed glass tube. The statement had been made, continued the speaker, that the tubes were filled with nitrogen, yet the odor given off upon breaking the tube resembled that of methyl alcohol. Chemical analysis, he stated, showed the presence of about 34 per cent. of arsenic, together with an

anilin derivative, and a phenol. He discussed briefly the chemistry of arsenic and pointed out that this element existed in a very active form in the "606" combination.

Dr. Stillians had brought with him a stained specimen of spirocheta pallida, which he showed under the microscope.

The members of the branch expressed their appreciation of this interesting discussion by giving a rising vote of thanks to the physicians and Prof. Puckner for their exposition of the subject.

The special committee appointed at the preceding meeting offered the following resolutions regarding the death of C. S. N. Hallberg, and they were duly adopted:

Since by the death of Prof. C. S. N. Hallberg the Chicago branch of the A. Ph. A. has lost one of its most earnest and highly valued members, and pharmacy in general an aggressive champion;

Be it resolved, That we, the members of the Chicago branch of the A. Ph. A. in regular meeting assembled, do publicly acknowledge our great sorrow at his death; and,

Be it resolved, That we give expression to our deep sense of obligation to him for his untiring efforts in behalf of this organization and to the sense of loss his death has brought upon us and the pharmacists of America; and,

Be it further resolved, That these resolutions be spread upon the minutes of the branch and copies be sent to the pharmaceutical press for publication.

A communication from Dr. A. Gehrman representing the Chicago Medical Society was read. Dr. Gehrman stated that his society would be glad to co-operate with the members of the branch in any form of memorial services for the late Prof. Hallberg, and suggested, that while the medical society could not undertake the raising of a subscription for the reason that several such projects are at present before the society, still he thought it quite possible that individual physicians would be pleased to take part in such a movement. A committee consisting of Messrs. Gathercoal, Becker and Clark was appointed by the president to confer with the representatives of the medical society regarding memorial exercises. Secretary Day spoke of the proposed action of the American Pharmaceutical Association now under consideration by the council, and having for its object the appointment of committees representing the branches and the members of the association generally, to raise a fund to pay off the mortgage on the Hallberg home.

Mr. Eliel presented an invitation which was read by the secretary, inviting the branch to meet at South Bend, Ind., at an early date. The invitation was favorably received, but it was decided to defer the selection of a date until the next meeting.

The nominating committee offered a list of candidates for the several offices of the branch, which was held over for the election at the January meeting.

At this meeting, held January 12th, the project of holding a meeting at South Bend, Ind., was taken up, and it was decided to meet there February 24th, and devote the meeting to a consideration of the new preparations of the National Formulary.

Leo Eliel opened a discussion of the rumored deferring of the launching of the journal of the parent organization. This discussion resulted in the adoption of a resolution expressing as the sense of the branch the desire that the publication plans be carried out according to the action taken at the 1910 meeting of the A. Ph. A.

Some informal discussion of the scope of the National Formulary was indulged in by Messrs. Eliel, Potts, Snow, Abbott, and others.

Following this was the election of officers resulting in the unanimous choice of the following candidates selected by the nominating committee: President, C. A. Storer; vice-presidents, I. A. Becker, S. K. Sass, and Miss Charlotte Stimson; secretary and treasurer, W. B. Day; committee chairmen, Membership, C. W. Patterson; education and legislation, C. H. Avery; practice, T. I. Scheips; medical relations, Dr. Bernard Fantus; and public relations, James H. Wells.

New England.—J. G. Godding, of Boston, president-elect of the American Pharmaceutical Association, addressed the meeting of the New England branch of the association held at Boston, January 11th. He thanked the New England members for their support of his candidacy, and spoke enthusiastically of the prospects for an excellent meeting of the parent body at Boston this year.

Pharmaceutical conditions were considered briefly in a talk by A. E. Brunelle, of Fall River, Mass., the new member of the Massachusetts Board of Pharmacy.

F. A. Hubbard, of Newton, a former member of the board

and ex-president of the National Association of Boards of Pharmacy, gave a talk on the education of young drug clerks, which epitomized his observations made during his long service as examiner and proprietor. While Mr. Hubbard recommended most highly a course of study at a college of pharmacy, he had very definite views as to the responsibilities of proprietors toward their clerks. He believed, as a matter of fact, that the average employer did not do his duty and was actually robbing the clerk of the educational help which should be given, because a clerk is engaged at a small salary with the expressed condition that he is to learn the drug business, while in reality, he learns only what he can pick up himself, usually in a faulty, disconnected manner.

Mr. Hubbard's sentiments were roundly applauded.

The meeting was addressed by R. B. Gable, of New York, on behalf of the national membership committee. He related in outline the various progressive movements in the history of the A. Ph. A., and dwelt particularly on the project of supplying a journal of considerable size free of charge to the members.

All told the meeting was a very interesting and enjoyable one.

New York.—Thirty and more persons were present at the meeting of the New York branch of the American Pharmaceutical Association held January 9th. Dr. James J. Walsh, the dean of the medical department of Fordham University, this city, was the speaker of the evening, having for his subject "The Problems of the Pharmacist in Ancient and Modern Times."

Treasurer Joseph Weinstein reported a balance on hand of \$23.52.

For the committee on legislation and education T. P. Cook quoted from the Foster anti-narcotic bill in congress (see page 105) and stated that the committee had opposed the measure in its present form believing that its purpose would be vitiated by the amount of detail required for its enforcement. Messrs. Raubenheimer, McIntyre, Hitchcock, Mayo, and McElhenie expressed similar views on the subject; and the committee was instructed to continue its opposition to the bill.

Dr. G. C. Diekman, chairman of the committee on the progress of pharmacy, gave a synopsis of recently published articles on the following subjects: "A New Reaction for Strychnine," "A Sterilizable Hand Balance," "Gummi Arabicum Resiccatum," "Apparatus for the Rapid Filling of Ampuls and the Sterilization of the Same," "The Sterilization of Dusting Powders," "A New Method of Estimating Quinine in Cinchona Preparations," "From Atoxyl to Erlich-Hata '606,'" and "The Detection of Ethyl Alcohol in Methyl Alcohol." After some discussion concerning the danger from tetanus genus in dusting powders, the report of the committee was received with thanks.

G. H. Hitchcock reported that the advisability of joining with the branch in a meeting this spring was being considered by the comitia minora of the county medical society.

The death of J. Le Roy Webber, of Brooklyn, was announced by the secretary, and duly recognized.

Dr. Walsh was introduced by Chairman Raubenheimer. He treated his subject as having the following phases: The number of drugs used; the regulation of the practice of pharmacy; the relations between physicians and pharmacists; substitution; proprietary medicines; and fixed prices. All these, he said, would by the average person be characterized as phases of modern conditions, but they have one and all confronted the apothecary time and time again since the earliest days of medicine.

The Doctor first took up in his recountal the woes of the drug man in ancient Egypt, beginning some 4500 years before the Christian era. He gave a synopsis of the Ebers papyrus and its monographs on 700 drugs in use from 2500 to 1700 B. C. In those days, he said, there were specialists and there was much knowledge of things medical that is to-day looked upon as something new.

From Friedlander's Roman Life and Manners under the Early Empire the speaker took several illustrations to show that the prescribing of proprietary preparations was then in vogue, Pliny having commented upon the fact. Galen in turn pointed out the sophistication practiced by herbalists. Several amusing instances of the antiquity of political "graft" and the suffragette movement were related in this connection. Similar conditions, said the speaker, continued down through the so-called Dark Ages.

Dr. Walsh next told of the beginnings of university education in medicine in the thirteenth century, and the medical and pharmacal law of Frederick II for the Sicilies. This law required of physicians eight years of preparation, educational and practical, before they were licensed. It forbade the physicians to have any business connections with any apothecary or to conduct an apothecary shop. It required apothecaries to testify to the purity of their wares, fixed the prices that might be charged for drugs, and limited the number of apothecary shops. Its provisions extended to the collection and inspection of drugs; negligent inspectors were punished by death, and sophisticating dealers lost their wares.

The Doctor did not subscribe to the belief that the drug sellers of the Renaissance period were great poison sellers. Neither did he believe that deaths from poisoning were as common as some historians relate. Many of the reputed deaths by poisoning he declared were due to pathological conditions.

In summing up, the speaker stated that if one looked closely into the conditions of former years he would find a great similarity to those of the present time; problems arise, are solved, and are forgotten, to arise again and require solution. Latter day progress he thought was in a commercial direction to the detriment of art, learning and ethics. He believed that the physician should assist the pharmacist to redeem his calling from commercialization by enlisting his services in the chemical phase, the laboratory work, of medicine. Laboratory diagnosis and biological work he said should be turned over to the trained pharmacist just as the preparing of medicine was long ago, and the physician should devote himself more to clinical study, to the advantage of physician, pharmacist, and patient.

Various phases of historical pharmacy were touched upon in the discussion following Dr. Walsh's address, in which Messrs. Mayo, Diner, McElhenie, and Raubenheimer, and Doctor Gordon participated. A number of historical volumes were exhibited. The thanks of the assemblage were extended to Dr. Walsh by a rising vote.

As a sort of annual address the retiring president, Otto Raubenheimer, urged the membership committee to get busy; advised that to the committee on professional relations be entrusted the planning of joint meetings with physicians heretofore in the hands of a special committee; and that the members try out the formulas suggested for inclusion in the Pharmacopœia and the National Formulary.

The branch expressed its appreciation of the efficient presidency of Mr. Raubenheimer.

The election of officers resulted in the choice of the following: President, G. H. Hitchcock, of New York; vice-president, Dr. G. C. Diekman, of New York; secretary Hugh Craig, of New York; treasurer, Joseph Weinstein, of New York; committee chairmen: membership, W. F. Macdowell, of Ellis Island; progress of pharmacy, Otto Raubenheimer, of Brooklyn; education and legislation, T. P. Cook, of New York; and professional relations, T. D. McElhenie, of Brooklyn.

Philadelphia.—At the meeting of the Philadelphia branch of the American Pharmaceutical Association held January 3d, the discussion was concerned with the new chemo-therapy method of treating disease and particularly with the Ehrlich treatment for syphilis. The speakers were Dr. Judson Daland, Dr. F. E. Stewart, and J. L. Turner.

Dr. Daland, who had spent several months in the Ehrlich laboratory reviewed the early efforts of that famous German biological chemist toward the confirmation of his theory regarding the direct action of chemicals on the parasites of disease. The speaker described the Ehrlich-Hata "606" and exhibited some in sealed glass tubes. He told how when exposed to air, it changed color from yellow to a gray or brown with changes in its properties; in some instances it had been known to become extremely poisonous. As marketed, said Dr. Daland, salvarsan is not susceptible to light or heat. He described the methods of reducing it to a liquid for injection. It is necessary to neutralize the acid, and dissolve it either in saline solution or sterile olive oil. Paraffin, he explained, had been used but with little success. The use of alcohol in converting it into a liquid for injection was, he said, not necessary.

Dr. Daland compared the several methods of introducing the Ehrlich remedy into the human system setting forth the dangers to be looked for with each. He was of the opinion it was too soon by four or five years to make a definite statement relative to the permanency of the re-

sults of this treatment. In closing he contrasted the Ehrlich researches with the popular practice of attempting to fit a drug to an unknown disease or symptom.

Mr. Turner explained in detail the science of chemotherapy. He outlined the various steps that had been taken by Ehrlich before the final result had been obtained and mentioned some of the difficulties and successes that he must have encountered.

Dr. Stewart spoke of the difference between the patent laws of Germany and of this country, saying that he understood that salvarsan had been patented in the former country and doubtless would be in this. He was inclined to the belief that the inventor had a perfect right to some return for his time and costly experiment. He was inclined to regret the registering of the trade-mark in this country, because under the law of the United States this course would virtually mean a perpetual monopoly here.

In the course of the regular business, Prof. Henry Kraemer presented a report on the proposition to establish a journal of the American Pharmaceutical Association. The committee after citing its approval of the project and suggesting minor changes and ideas, recommended that instead of launching the journal July 1st, next, as determined at the Richmond meeting, the publication of the initial issue be postponed until January 1st, 1912. The principal reason for this was that no person had as yet been found to occupy the position of editor. The report was received and referred to the national committee on the journal of the American Pharmaceutical Association.

Washington.—A continuation of the discussion of standards for non-pharmacopœial drugs called for in the National Formulary occupied the City of Washington branch of the American Pharmaceutical Association at the meeting held January 14th. Several members offered descriptions of such drugs. Adonis, aletris, althea, and aralia were described by V. R. Chestnut; ammoniac, calcium glycerophosphate, diacetyl morphine, and quinidine, by H. C. Fuller; anethol, oil of bergamot, oil of myrcia, and oil of orange-flowers, by E. K. Nelson.

In the course of the discussion, attention was called to the difficulty of providing satisfactory standards for many of the little-used botanical drugs, particularly American botanicals, as these articles are usually variable in origin and are generally contaminated with admixtures of various kinds. It was stated that the source or supply of American drugs could not well be regulated or controlled, because they are usually collected by untrustworthy persons and are bartered or sold repeatedly before they reach any one at all familiar with their true nature or use; and because it is perhaps asking too much to expect the dealer in drugs to be able or even willing to remove all extraneous substances from his wares. Mr. Fuller averred the necessity of investigation in order that chemistry may be of avail in the differentiation of drug plants. This led S. L. Hilton to point out the difficulty of assaying glucosidal drugs and the readiness with which drugs of this class deteriorate. Mr. Chestnut stated that glucosidal drugs deteriorate because of the presence of enzymes, particularly oxidizing enzymes, which in the presence of light and moisture, have a tendency to decompose glucosides. It was also pointed out that to preserve glucosidal plant drugs it was necessary to destroy the enzymes or ferments present, or at least to preserve the drug in such a way as to make their presence innocuous. Dr. Reid Hunt also spoke of the far-reaching influence of oxidases present in a plant, upon its appearance and composition.

Lewis Flemer described a method of preserving plant drugs containing glucosides which he believed was first introduced by Dr. H. H. Rusby. This consisted in placing muslin bags containing freshly calcined lime in the container with the drug. His experience with this method has not been altogether satisfactory. In this connection it was said that in Switzerland where the preservation of drugs over calcined lime was suggested in the Pharmacopœia, it is a common practice to use a tin container with a well-fitting lid and a double bottom. Between the bottoms of this container freshly calcined lime is placed, and the drug is placed in a bottle, not necessarily tightly stoppered, over the lime. This container it was declared has the double advantage of preserving the drug from light as well as moisture, and would no doubt be practicable and advantageous for drugs like digitalis. The need for the preservation of plant drugs with especial precaution was discussed at some length, and in the course of this discussion it was pointed out that in the supplement to the Dutch Pharmacopœia just issued it is provided that all of the narcotic leaf-

drugs are to be protected from light; a precaution that is well worth considering, and one that should be introduced in the forthcoming edition of our own Pharmacopœia.

Dr. Hunt, referring to the stability of digitoxin, said that digitalis is probably not so readily decomposed under ordinary conditions as is generally believed. He called attention to some experiments that had been made by Dr. Edmunds, who demonstrated that a very old digitalis leaf and one that had not been preserved with any particular caution was found to be still active. S. L. Hilton reported some observations that had recently been made on a sample of powdered digitalis leaf, at least three or four years old, which was found to be quite active, medicinally.

Prof. H. E. Kalusowski called attention to some of the points of difference between quinine and quinidine. He also pointed out the distinguishing tests for and the similarity between the two substances in their property of fluorescing in aqueous solutions.

The preservation of essential oils was discussed at some length by Messrs. Nelson, Chestnut, and Hilton, who were agreed that the presence of light materially affected the delicate odor of many of these products.

To determine the value of the proposed standards which were under discussion, it was suggested that copies of the descriptions be sent to persons interested who might be in a position to criticize and to elaborate on such tests or requirements as were included; these criticisms to be considered at a later meeting of the branch.

Southeastern Auxiliary of the National Association of Boards of Pharmacy.

In connection with the regular meeting of the Virginia Board of Pharmacy, at Richmond, there was held January 4th the second annual meeting of the Southeastern auxiliary of the National Association of Boards of Pharmacy. In addition to the members of the Virginia board there were present, Louis Schulze, of the Maryland Board of Pharmacy; and N. C. Downs, of the Delaware Board of Pharmacy.

Mr. Schulze in an informal talk explained the objects of the meeting. He believed that the members of the boards of Maryland, West Virginia, Virginia, and the District of Columbia, which constitute the auxiliary, should discuss the matters of importance to the several boards, and that the conclusions should be carried to the national association. He mentioned as important subjects preliminary educational requirements, a satisfactory curriculum for colleges of pharmacy, and the advisability of meeting with an affiliated board at the time it was holding an examination.

T. A. Miller, of Virginia, laid especial stress upon the advantage to be gained by members of the various boards visiting other boards while in session.

The methods adopted by the Delaware, Maryland and Virginia boards in conducting their examinations were very fully explained and discussed by all present. Mr. Downs explained the methods adopted by his board, stating that the practical work was conducted by two members, and that each member examined only the answers to the questions that he had prepared. Mr. Miller expressed the hope that in the near future the Virginia board would rate the answers to questions at 80 per cent., allowing the candidate 10 per cent. for his correctness in writing, English, method of expression, etc., 5 per cent. for neatness, and 5 per cent. for speed.

Officers were elected as follows: President N. C. Downs, of Delaware; and secretary, T. A. Miller, of Virginia. It was decided that each board appoint a vice-president and report the appointment to the secretary.

National Association of Pharmacologists.

A regular monthly meeting of the National Association of Pharmacologists was held at Columbus, Ohio, December 27th. There was an election of county committeemen. And it was announced that the establishment of a benefit fund would be deferred until the first annual meeting which will be held in June.

The projection and furtherance of plans for a national home for indigent druggists was discussed and the co-operation of other drug and pharmaceutical organizations will be solicited.

By resolution a vote of thanks was extended to the pharmaceutical press for the publicity given to the affairs of the organization.

Lecture on Standardization before New York Alumni.

At a well-attended meeting of the Alumni Association of the College of Pharmacy of the City of New York, held January 11th, alumni and students of the college and their friends listened to a lecture on "Standardization, Chemical and Physiological," by Prof. C. E. Vanderkleed, of Philadelphia.

Prof. Vanderkleed prefaced his address with a statement of the impossibility of properly treating such a broad subject in one lecture and therefore he would limit himself to setting forth the general principles surrounding and underlying the standardization of drugs. He defined standardization as the adjustment of a substance or thing to a certain adopted "standard" size, or strength, or quality, which "standard" must, of course, be more or less arbitrarily chosen, or agreed upon, by all of the parties concerned with the manufacture, sale, or use of the substance in question. The term, he said, was often abused in this country and inaccurately used. He stated that there was a difference between an assayed drug and a standardized one, that an assayed substance was not necessarily a standardized one, and standardization went farther and included final adjustment to a definite strength. He said that it was almost a commercial impossibility to obtain standardized crude drugs in the United States with the exception of powdered opium, and he considered that to furnish them would be a difficult matter, and unnecessary because, with the possible exception of opium and ipecac, crude drugs were seldom given internally and standardization of the crude drug did not imply uniformity of the galenicals made therefrom. He gave as reasons for this a lack of uniformity in packing a percolator, uncontrollable or difficultly controllable natural variations such as those of temperature, the fact that the weak portion of the percolate, which, in the case of fluidextracts must be concentrated, may contain an appreciable amount of active principle which is thus subjected to the possibility of decomposition, that variation in the structure and thickness of cell walls of different lots of drugs assaying alike may enable the menstruum to be more effective in one case than in the other; and while the result of the assay may have given a figure which represents absolutely the sum total of alkaloids present in the drug, it would not necessarily follow that this drug will yield the same percentage of total alkaloids to percolation with an alcoholic or hydro-alcoholic menstruum. Experience, he said, had taught him that drugs which assayed identically or nearly so, gave percolates that varied greatly. He cited as an example a quantity of cinchona which assayed over 8 per cent. of total alkaloids but on percolation yielded only 3 per cent. of alkaloids, not over a half of which were of the ether-soluble variety; using an acidified menstruum resulted in a heavy precipitate in the percolate, yet experts had pronounced the drug botanically and microscopically true to name.

Prof. Vanderkleed believed that as many preparations as possible should be standardized. The pharmacist, he said, must furnish the physician with accurately calibrated weapons that will reflect credit upon the profession as armorers to the fighters of disease. The revision committee of the United States Pharmacopoeia and the best thinkers in the two professions of pharmacy and medicine, he continued, recognize the advantage of extending the work of chemical and physiological standardization and of authorizing the inclusion of the latter in the next U. S. P. This, he said, placed a great responsibility on the members of the revision committee. He praised the revision committee of 1900 for putting the present U. S. P. "in the lead of all pharmacopœias of the world, with respect to standardization, both as regards the number of drugs and preparations provided with assay processes and the excellency and accuracy of the methods adopted." He believed that in the ninth revision the number would undoubtedly be further augmented.

He was of the opinion that the professional pharmacist of to-day would be the financially successful pharmacist of to-morrow and that this type of pharmacist was ready to aid in any movement toward progress, such as standardization represented. This movement, he declared, while seemingly directed against the pharmacist, was so only in so far as he tried to stem the tide of progress. If he worked with it and furthered it by his own contributions, he would, in the speaker's belief, help himself professionally, socially and financially.

Prof. Vanderkleed advised those who use but small quantities

of standardized preparations to procure them in quantities suited to their needs, because in opened and partly filled containers they deteriorate more or less rapidly. He thought that as a rule not enough consideration was given to the preservation of this class of preparations which should be kept in a cool place and not exposed to the light. Even this would not prevent the deterioration of fluidextract of coca which, he remarked, he was almost tempted to say, he would be more pleased to dispense the more it had deteriorated.

One phase of the standardization of galenical preparations which he thought deserved mention was its disturbing effect on color uniformity. A preparation made from a different lot of drug, possibly from a new year's crop, and accurately standardized, he said, is exceedingly liable to differ in color, or in specific gravity from some previous lot. Preparations cannot possibly be adjusted to alkaloidal content, color, and constant total solids, and he could see no remedy for this difficulty. In his estimation it needs no correction; the pharmacist should educate the physician and the patient to the foregoing truth, and if the ignorance of the patient will not permit him to be convinced, and the psychologic effect is liable to be lost upon him, it is the physician's business to obviate the difficulty.

The speaker said that perhaps the greatest obstacle to progress in scientific standardization lies in the difficulty of knowing what the medicinally active constituents of certain drugs are, and next comes the difficulty of separating them one principle from another, which may possess little, or no or an adverse medicinal action. Here the pharmaceutical chemist must rely upon the pharmacologist, because the physician wants a preparation that will always have the same pharmaco-dynamic effect, and hence, under the same conditions, the same therapeutic effect. The principal end to be accomplished by the assay of a pharmaceutical preparation, he said, was to secure a means of measuring the therapeutic activity.

Considering next methods of standardization the speaker said that the first method to become extensively used in this country for the standardization of drug preparations, that of precipitating the alkaloids by means of a standard Mayer's reagent, was empirical and crude, because no differentiation between important and unimportant alkaloids could be obtained by it, substances other than the alkaloids being determined were sometimes, also precipitated, the composition of the alkaloidal precipitates varied with conditions of dilution, temperature, etc., and the end-reaction was not sharp and was difficult of observation. Still, he continued, it was a beginning, a step in the right direction, and led to the more accurate alkalimetric and iodometric methods of assay, until today the assay of alkaloidal drugs has reached a high state of accuracy and perfection. Some of the methods for the assay of galenicals and other drugs, he stated, are yet in a crude condition, but they should not be condemned or discarded until it is possible to supplant them with more accurate processes.

Because few drugs contain one single active constituent that represents the entire medicinal value of the drug, he declared that it would always be impossible to make the results of chemical assay absolutely indicative of therapeutic value. However, he believed it possible in most instances to secure invaluable information by the determination of the total alkaloids, or of some readily determined single alkaloid.

As a general fault of the present U. S. P. methods, Prof. Vanderkleed mentioned the inadequate amount of immiscible solvents specified in the descriptions of the processes; and he thought that the pharmaceutical chemist should be left free to "shake-up" with larger quantities if he believed this necessary to make sure that the extraction was complete. As another possible improvement he suggested the use of more satisfactory indicators in volumetric titrations; methyl-red, (para-dimethylamine-azo-benzol-orthocarbonic acid) he said, would give a bright violet-red with a slight excess of acid and was colorless or slightly yellow in the presence of alkalies. Any improvement looking toward the elimination of doubt, he stated, would help to improve the processes.

In speaking of physiological assays he said that, if it were granted that accurate results might be obtained, the question arises as to what drugs these tests should be applied to, and as to what the present-day practice has to offer in tried and true assay processes.

Summing up, Prof. Vanderkleed declared that standardization marks a progressive altruistic movement toward the day when drugs will be more accurately and effectively

and hence less extensively used for the cure of disease. He urged that the movement be not opposed because of this trend, saying that pharmacists, physicians and chemists are first men, then citizens, and thirdly, members of their profession, and to serve humanity first is the best way to bring honor to the profession and success to its members. He praised the professionalism that uttered not one word of protest against Ehrlich's discovery on the ground that this one remedy would undoubtedly mean the loss to pharmacists and physicians of hundreds of thousands of dollars. And he advised his hearers to strive altruistically for the standardization of drug products, real standardization, the kind that points out weaknesses as well as strength.

Prof. Vanderkleed was formally thanked by the assemblage for his instructive discourse.

After adjournment there were music and dancing to be enjoyed by many, and refreshments were served.

Kings County Society.

That the legislative season is with us again would have been apparent to even the casual visitor to the meeting of the Kings County Society, held January 10th. The Foster bill was the all-absorbing topic. William Muir, chairman of the legislative committee, declared that this proposed measure was a distinct menace to the retail drug trade and one of the most unreasonable measures that he had ever heard of, one which besides working a hardship seemed in no way to be of particular benefit to anyone. He did not think that it would restrict in any way the sale of narcotic drugs and expressed surprise that the chairman of the legislative committee of the National Association of Retail Druggists should have expressed himself in favor of such a law. He thought that possibly he himself might not be interpreting the bill aright and asked for the opinions of the other members.

Otto Raubenheimer was of the opinion that an anti-narcotic wave was sweeping the entire country, but he could not understand the objects of this bill. He did not think it reasonable to expect the druggist to keep account of every grain of narcotic drugs sold.

For the benefit of those who were not familiar with the provisions of the bill, it was read by H. S. Noël, of THE DRUGGISTS CIRCULAR. C. A. Mayo spoke of the provisions of the measure in detail. The society decided to send Mr. Muir to Washington to be present at a hearing on the bill to occur the next day and to voice the sentiments of the Brooklyn druggists in opposition to the bill as it now reads.

Prof. W. C. Anderson, who was chairman of the committee on resolutions of the N. A. R. D. at the Pittsburg convention, spoke of the intentions of the anti-narcotic resolutions adopted by that association and expressed surprise that Chairman W. S. Richardson of the national legislative committee should have favored the Foster bill. He thought perhaps Mr. Richardson had not properly understood its import.

The chairman of the committee on pharmacy, Otto Raubenheimer, stated his intention to review the new German Pharmacopœia (see page 92) at a meeting in the near future. He announced that the speaker at the February meeting would be J. L. Mayer who would speak on "Milk Analysis."

Mr. Raubenheimer then introduced the speaker of the day, E. L. King.

Mr. King, who spoke on "Advertising Methods for Retail Druggists," took as his theme the following formula:

Right Goods + Right Prices + Right Service + Advertising = SUCCESS.

There are, he said, two kinds of druggists: those who look forward and those who look backward—and some who look not at all. The constant changes in commercial life must be met, he stated, and the druggist to be successful must adapt himself to them. Twenty-five years ago the druggist did not do business the way he must to-day, he said, because at the present time keeping a drug store is a commercial enterprise and must be treated as such. While he thought that it was possible to combine the ethical and the commercial in pharmacy, he did not think that the purely ethical store in the majority of cases would be a success financially.

In his opinion much advertising that would cost the druggist scarcely anything was not taken advantage of. He mentioned personality: the druggist who should be

pleasant is sour and unaccommodating—and blames business. It costs nothing, said he, to keep a store clean, but he averred that 75 per cent. of the Brooklyn druggists have fly-specked goods on their counters. He thought that shelf bottles with pretty gilt labels did not sell goods and believed that if those bottles were replaced with the goods that many druggists put under the counters the profits would be greater. The best proof of this, he said, was the fact that the most successful stores display the goods that the people want as attractively as possible.

He stated that he had been asked many times what was the matter with the retail drug business and his reply had always been: "Nothing." In his belief the business was better than ever. This he thought was indicated by the investments in the retail drug business being made by capitalists. In reply to a question as to what the small druggist was going to do, he expressed the belief that the small dealer will survive. In spite of the fact that many say that the druggist is a convenience and some say that is all he is the speaker was of the opinion that he is a necessity.

In the history of the drug business, he said, there had been revolutions. First, the cut-price druggist caused one, and the next came when the cutter realized he was on the wrong track and began to talk quality. He believed that the third revolutionizer was at hand in the chain-store and that it was here to stay and must be reckoned with. In his opinion the corporation chains were going to get all the business they could and the small druggist must meet them on their own ground by advertising.

He felt that undoubtedly some of the less efficient stores would be eliminated, but believed that this would be a good thing for both the public and the drug trade. He thought that a poor druggist was analogous to a poor grocer, he must resort to subterfuge and inferior quality to get along.

The druggists should seek to reach the trade along the lines of least resistance, he said, and their salvation lies in their own efforts because the man who gets something for nothing usually pays a high price. Legislation, he declared, will not force people into a store if they do not wish to come. He advocated cut prices for advertising purposes because it was a trade truism that people will go where they are served the cheapest. He did not consider the cutting of prices on proprietaries to be ruinous. To support his point he computed the difference in the gross profits of a store in which the usual small proportion of proprietaries is sold when these are sold at full prices and when they are sold at a cut rate. For the slight difference, in his opinion, the druggist was sending away many profitable customers.

Judicious advertising, he contended, was not a waste; it was an investment. He mentioned as adjuncts clean windows, a variety of displays and a smile that would not "come off" and he pointed out the necessity of keeping at advertising on a definite plan. In his opinion the local druggist could well afford to set aside at least 3 per cent. of his profit for advertising.

In conclusion Mr. King advised his hearers to advertise and display the goods that the people in the particular locality wanted, and to tell them about these particular goods in their own language.

Mr. King was officially thanked by the society for his interesting talk.

Charles Heimerzheim announced for the trade matters committee that the postal cards, for the purpose of calling the attention of physicians to seasonable N. F. and U. S. P. preparations, were ready for distribution and would be mailed to any member upon application. The sum of \$100 was appropriated for the propagandic work of the trade matters committee.

Adjournment came somewhat later than usual because of the lengthy address.

Brooklyn Association.

One of the best attended and most interesting meetings of the Brooklyn Pharmaceutical Association held in some time was called to order by President David Westheimer at 11 P. M. January 23d.

The regular order of business was suspended to permit the reading and discussion of a paper by J. Leon Lascoff, of this city on "Acacia in Dispensing."

Mr. Lascoff began his paper with a description of acacia and a summary of its history. He then told of the many uses it had in the drug stores of the present time. He

illustrated his talk with a number of copies of prescriptions written in large letters for the convenience of all. In this connection he elucidated the changes that the use of a small amount of acacia will make in the appearance of what might otherwise be unsightly mixtures. In addition to the reproduced prescriptions, Mr. Lascoff used, the better to illustrate his points, many mixtures compounded with and without acacia. Following the showing of each prescription, the speaker invited such general discussion and comment as the members might see fit to make.

Concerning a prescription calling for 5 grammes of pyramidon to be dispensed in 60 c.c. (mils) of water, Prof. Joseph Kahn thought that the druggist would not be justified in using acacia even though it did improve the appearance of the prescription. He said that he would preferably call the doctor and enlighten him in regard to the insolubility of pyramidon.

Otto Raubenheimer said that he did not advocate the use of acacia in this instance because so little was known of pyramidon and its interaction with other substances even though acacia was seemingly an inert substance. He thought it should be the duty of the manufacturer to print on the label of such drugs the dose, solubilities, and incompatibilities.

Mr. Lascoff stated that he merely was endeavoring to show what acacia would accomplish; its indispensability in some instances and in others the trouble it might obviate, were its use permissible.

The next prescription which seemed to merit discussion was one containing creosotal in a mixture of glycerin syrup of orange, and peppermint water. Mr. Raubenheimer stated that he had had experience with similar mixtures and for a time had added oil of sweet almonds; afterward he had secured good results from the use of oil of sesame. Prof. Kahn said that creosotal was nothing more or less chemically than carbonated creosote and was to be kept in colored glass bottles. He thought that if the mixture in question was dispensed in a colored glass bottle little or no trouble would be experienced, although he had not experimented with it. Alexander Gardner was of the opinion that the change of color in such a mixture was due to the formation of a phenol.

David Westheimer questioned the wisdom of the liberal use of acacia in prescriptions without first consulting the physician. Mr. Lascoff said that in his experience he had always found the physician agreeable to the addition of such an inert substance which would improve the prescription. Mr. Lascoff assured his audience that he was most decided in his views against substitution, yet he felt justified very often in the addition of a slight amount of a substance which did not alter the therapeutical value of a prescription.

A prescription calling for creosote and balsam of tolu brought forth a suggestion from Thomas Lamb that he had secured very good results with these ingredients by using beeswax to make a mass. Mr. Raubenheimer said that balsams of a resinous nature, albeit pure, often caused trouble, even in the mixing of ointments and acacia, he had always found, was of great value. Questioned about ichthylol and olive oil in a mixture, Mr. Lascoff said he would experiment. This occurred in connection with the discussion of a prescription calling for balsam peru and olive oil. Mr. Gardner thought the reason for the immiscibility of the balsam was due to the presence of water in it, because if the balsam was heated and the water driven off no trouble was experienced, and admixture with olive oil was easy. Prof. Kahn thought it inadvisable to heat the balsam. Mr. Raubenheimer said that chemists knew but little of the composition and characteristics of balsam of peru and that heat might drive off some of the volatile constituents, he had found he said that petrolatum mixed very well with it [but will not stay mixed.—Editor THE DRUGGISTS CIRCULAR] and therefore liquid petrolatum might prove satisfactory where it was possible to use it.

At the close of Mr. Lascoff's paper, Secretary L. J. Cohen read a prescription calling for 3 drams of potassium acetate, 8 drams of tincture of chloride of iron, 4 drams of diluted phosphoric acid, and enough infusion of digitalis to make 4 ounces. He had been informed that once this prescription had been filled and the product was colorless; when it had been dispensed at another store it was not colorless, and he asked the cause of such a difference. Various theories were advanced but no satisfactory explanation was given.

A communication was read from the Manhattan Pharmaceutical Association relative to co-operation in endeavor-

ing to secure better provisions for the sale of insecticides containing benzin. The matter was referred to the conference committee.

The Foster bill (see page 105) was discussed. The consensus of opinion was not antagonistic to the bill providing it was modified somewhat in phraseology.

Thomas Lamb stated a grievance having to do with the manner in which legislative matters were being handled by the Conference of Local Pharmaceutical Associations, it being his belief that the Brooklyn Association was not receiving due consideration. S. L. Neier differed with Mr. Lamb in some respects, believing that in the work of the conference the Brooklyn association had always had a voice.

Mr. Lamb stated that ex-Assemblyman R. S. Conklin contemplated furthering a State measure that would relieve the druggists of New York city from supervision by the municipal board of health.

An invitation was extended to Prof. Kahn to address a meeting of the association in March, and to Mr. Raubenheimer to speak at the last meeting in February.

Mr. Lascoff was officially thanked for his interesting paper and was elected to honorary membership in the association. Mr. Raubenheimer and Prof. Kahn were also thanked for their participation in the discussions.

After adjournment the members enjoyed a chicken supper and were entertained by a legerdemain performance.

Westchester County Association.

It was not a very much occupied meeting that was held by the Westchester County (N. Y.) Pharmaceutical Association at Yonkers, January 11th; nevertheless the members present found enough matters of interest to occupy their attention for several hours.

Almost exactly at noon President J. H. Thomas, of Yonkers, called the meeting to order, and Secretary J. B. Sackett, of Tarrytown, proceeded with the reading of the minutes.

The first matter to call for discussion was brought up when the secretary read a communication from the member who had been expelled at the preceding meeting (see the CIRCULAR for November, 1910, page 599), in which the action of the association was questioned, the ex-member contending that he had not been informed of the charges against him and did not know wherein he had violated the laws of the organization. As the matter was basically one of price-cutting it was not thought wise to furnish the offender with advertising material by going into the case again; the investigating committee said it had given the member an opportunity to be heard. Messrs. Schlesinger, Sackett, Smith, Leonard, and Townsend discussed the communication, and the secretary was instructed to tell the writer that the association could see no reason to change its position assumed at the preceding meeting.

Mr. Sackett, who is treasurer as well as secretary, presented a report on the year's finances, showing a balance on hand of \$4.22, with unpaid dues amounting to about \$100. A special effort will be made to clean up these outstanding assets. Several bills were ordered paid.

The resignation of one member was accepted.

W. H. Smith, of White Plains, reported that the propagandic committee was awaiting the pleasure of the medical society with regard to a joint meeting. He read from a communication from the National Association of Retail Druggists quoting prices on propagandic literature. After considerable discussion of various methods of distributing this literature it was decided to arrange for using the N. A. R. D. supply and first to try the plan of having it sent from Chicago to the physicians.

For the telephone committee John Roemer, of White Plains, reported that the public service commission had not yet attempted any regulation of telephone rates or commissions but would take cognizance of any question raised in relation to this matter. F. A. Russell, of Tarrytown, said that he would take up the matter with Vice-President Thurber of the telephone company.

C. A. Heiss, of Yorktown Heights, of the special committee on new members, reported that two druggists of Brewster were desirous of joining the association and he expected to have their applications soon.

Memorial resolutions for the late J. F. Helmecke, of Tuckahoe, were adopted.

An amendment was made in the constitution to permit druggists in the adjacent counties to become members of the association.

The chairman called upon Hugh Craig, of THE DRUG-

GISTS CIRCULAR, who responded with an informal talk relative to the apparent trend toward the separation of pharmacy from the sale of nostrums and side-lines. He said that the physicians were beginning to look for professional scientific assistance from the pharmacist and it behooved the latter to make the most of this opportunity to advance himself and his calling.

W. H. Leonard, of Tarrytown, spoke of the advantages of mutual inter-insurance.

Officers were elected as follows: President, John Roemer, of White Plains; vice-presidents, J. A. Hart, of Ossining; and C. A. Heiss, of Yorktown Heights; secretary and treasurer, J. B. Sackett, of Tarrytown; executive committee, L. J. Schlesinger, of Yonkers; W. H. Leonard, of Tarrytown; and F. G. Koch, of Mamaroneck.

After adjournment dinner was served, and after dinner there was an inspection of the new Yonkers city hall under the guidance of Mayor T. J. Lennon, who was once a druggist.

The April meeting will be held at Ossining.

German Apothecaries' Society.

President George Kleinau opened the meeting of the New York German Apothecaries' Society, held January 5th, with an expression of seasonable greetings to those assembled.

Secretary E. A. Boetzel read a number of communications, among them being an invitation from the Manhattan Pharmaceutical Association to join in a general committee for the purpose of opposing the levying of the \$50 license fee required of druggists, by the city, for the sale of inflammable substances. This matter was referred to the chairman of the business committee, S. V. B. Swann.

Reports were read by G. C. P. Stolzenburg, librarian, and Emil Roller, chairman of the committee on scientific papers. O. P. Gilbert, the chairman of the entertainment committee, also made his report and read the report of P. F. Gebicke, relative to the death-benefit fund.

President Kleinau announced that he had appointed the same members to serve as chairmen of the various committees who had held these offices during the previous year. E. C. Goetting was elected chairman of the delegates to the United German Societies.

As delegates to the 1911 meeting of the American Pharmaceutical Association at Boston, the society chose Dr. W. C. Alpers, Otto Raubenheimer, Emil Roller, Louis Berger, and Hugo Kantrowitz.

The death of Albrecht Wortmann was announced from the chair.

Mr. Goetting read a lengthy communication which he had addressed to Health Commissioner Lederle in the matter of the anti-morphine ordinance. The writer was seeking information, and the only reply he had had was a statement from the commissioner's secretary to the effect that the board of health still had the matter under advisement.

Mr. Roller introduced the speaker of the evening, Dr. F. von Oefe, who spoke on "The Compounding of Prescriptions by the Ancient Egyptians and Babylonians as Illustrated by Hieroglyphics and Cuneiform Writings," a subject which has been especially studied by the Doctor. The lecture, which was a very full account of the state of pharmacy among those peoples was supplemented by an exhibit of a valuable collection of pertinent material. This material was furnished by Prof. Mueller, to whom a letter of thanks was sent.

President Kleinau expressed the hearty thanks of the society to Dr. von Oefe at the conclusion of his talk.

New York College Meeting.

At the regular quarterly meeting of the College of Pharmacy of the City of New York, held January 17th, the constitution was amended so that in the future the meetings will be held on the third Tuesday of January, March, May and October.

Appropriate resolutions were adopted in memory of several members who had died during the year and provision was made for memorial pages in the official minutes.

A feature of the meeting was a symposium on Ehrlich's new remedy commonly called "606," and to be known as "salvarsan." A large audience of physicians, pharmacists and students was present.

The first paper was presented by Dr. Robert A. Hatcher,

of Cornell University; his subject was "The New Chemo-Therapy." He was followed by Dr. John A. Fordyce, of Bellevue Hospital, who told of the clinical results so far observed with Ehrlich's remedy. The last speaker was Herman A. Metz, who spoke on "The Role of Dye Stuffs in Medicine."

The several speakers were officially thanked for their valuable papers.

National Pharmaceutical Society.

The annual meeting of the National Pharmaceutical Society, and the first in its new home, was held in this city on the evening of January 9th. The society has leased rooms at 2320 Eighth avenue, and they are being fitted up appropriately.

The meeting was called to order by President W. E. Crews. Owing to the time consumed in the election of officers and by several discussions, the presentation of the reports of the officers and committees was postponed until the next meeting.

The following officers were elected for the ensuing year: President, Warren Guest; vice-presidents, J. R. Wall, H. N. Butler, and J. S. Jacobs; treasurer, J. G. Ahrens; and secretary, E. L. Fendler.

It was decided to bestow upon the retiring president the title of honorary president. The secretary was empowered to choose at his discretion an assistant secretary whose remuneration would be regulated by the secretary with the approval of the board of directors.

At a meeting of the society held January 16th, the reports of the officers and committees were read. These were indicative of a flourishing condition of the affairs of the society.

A commercial travelers' auxiliary was organized at this meeting, the dues of which will be donated to the society for propagandic work. The auxiliary elected the following officers: President, Edward Schott; vice-president, Julius Eisenstein; and secretary and treasurer, Maurice Feinberg.

With the aid of the auxiliary the society planned to hold a "smoker" and "house warming" on February 20th.

The date for the regular meeting was fixed as the first Monday of each month.

A junior auxiliary to the N. P. S. was organized at a meeting of unlicensed clerks held at the society's rooms, January 19th. The objects of this auxiliary are to be similar to those of the society. Meetings will be held the first and third Thursdays of each month at the society's rooms. The dues will be \$1 per annum.

The juniors elected officers as follows: President, L. P. Lippman; vice-president, M. Rochman; secretary, E. Mandt; and treasurer, V. J. De Matthaëis.

Long Island Drug Club.

Twenty-six applications for membership were acted upon favorably at a meeting of the Long Island Drug Club held January 16th.

Otto Raubenheimer extended an invitation to the members to be present at the meeting of the New York College of Pharmacy, on the next evening, to hear a symposium on Ehrlich's "606."

A communication was read from the Brooklyn Pharmaceutical Association inviting the club members to attend the B. P. S. meeting on January 23d.

At the conclusion of the business session, bowling teams of druggists and salesmen contested on the alleys until a late hour.

The next meeting will be held February 20th.

Blizzardites Will Dine.

The "blizzard class" of the College of Pharmacy of the city of New York, being that which was graduated in 1888, will hold its annual dinner at Terrace Garden, Fifty-eighth street, this city, Monday, March 13th, at 7 p. m. Prof. C. F. Chandler and Prof. C. W. Parsons will be the guests of honor.

Notifications of an intention to be present should be sent early to Dr. G. C. Diekman, at the college.

The most recent boards of pharmacy to adopt the National Pharmaceutical Syllabus wholly or in part as a standard at their examinations are those of South Carolina and Vermont. The Southern Association of Boards of Pharmacy has recommended to the constituting boards the adoption of the syllabus.

Misbranding Charged in Pennsylvania.

In interpreting the pure drug law of that State the Pennsylvania Board of Pharmacy, to which the enforcement of the act is entrusted, ruled that when a preparation sold under an official name varies from the official standard the amount of variation must be stated plainly on the label; that is, if a tincture of opium represents but 8 per cent. of opium, the label must tell that it is only four-fifths official strength and not merely state the percentage of the drug. The board gives as its reason for this ruling the belief that to the lay purchaser a statement of a percentage content means nothing as he does not know the required percentage.

Under this ruling actions have been brought against the Philadelphia representatives of Parke, Davis & Co., of Detroit, Mich., and of Sharp & Dohme, of Baltimore, Md., charging that samples of essence of pepsin obtained from the defendants were not labeled as required with regard to their variation from the official product.

Both cases will have a court trial, the defendants claiming that they have complied with the law, and that the board exceeded its authority in formulating the regulation in question.

In a statement issued by the home office Parke, Davis & Co. refer to the suit against their representative as a friendly test case to determine the legality of the board's ruling.

A different sort of misbranding is charged against the Penn Pharmacal Company, of Philadelphia, a concern which manufactures supplies for physicians. The bill of complaint sets forth the contention that the labels upon the company's products are not true indications of the composition.

A hearing in this case occurred January 10th. Prof. C. H. La Wall, testifying as a witness for the prosecution, said that "*kalarine*," labeled as being "a definite compound, well adapted for administering to patients with cardiac lesions," was a mixture of "acetanilide, sodium bromide, caffeine, and sodium bicarbonate, artificially colored green with a coal-tar dye."

Dr. H. C. Wood, testified that the mixture was far from a safe one to be given to patients with cardiac lesions.

Dr. V. C. Roberts, formerly chemist and general manager for the defendant concern, stated that in most cases the product put into the bottles did not conform strictly to the published formula. "*Malic*," he said, was a "malting grape juice" containing no unfermented grape juice. Prof. La Wall said that he had found almost 8 per cent. of alcohol in this preparation, which was exploited to take the place of alcoholic medicaments.

The president of the company was held in \$600 bail for a court trial.

Philadelphia Association.

Much interest was centered in the annual meeting of the Philadelphia Association of Retail Druggists, held January 6th. One of the features of the meeting was the discussion of the question as to whether the association should reaffiliate with the National Association of Retail Druggists. Action on this matter was deferred pending an investigation which it is expected will be completed in the course of thirty days. Charles Rehfuess said that at a conference of members representing both sides of the controversy it had been decided not to settle the matter at the annual meeting, but to await the result of the investigation.

The officers and chairmen of the various committees reported on the work accomplished during the year. The report of the telephone committee through its chairman, D. J. Reese, was especially interesting. The question of adequate commissions was discussed and referred to a special committee.

Officers were elected as follows: President, Christopher Koch; vice-presidents, W. E. Lee, D. J. Reese, and Morris Herson; recording secretary, N. A. Cozens; financial secretary, C. W. Shull; treasurer, G. W. Fehr; members of the executive committee, W. A. Carpenter, Frederick Keller, W. E. Cline, H. L. Hetrick, Dr. J. F. Meade, W. H. Umstead, G. T. Lambert, A. G. Keller, Charles Leedom, D. H. Ross, H. A. Kalbach, M. D. Allen, R. T. Blackwood, J. C. Peacock, and C. F. Schmickle.

H. O. Curtis, a visiting druggist from Camden, N. J., was elected an honorary member of the association.

Chicago Association.

Progress was the keynote and all the rest of the score in the reports of officers and committees presented at the annual meeting of the Chicago Retail Druggists' Association held January 10th. President L. P. Larsen sounded the first gratifying note summarizing and calling attention to the work that had been done in the various departments. He was loud in his praise of his fellow-officers for the manner in which their duties had been fulfilled.

The report of Secretary I. M. Light showed that the membership roll had been increased during the year by the addition of seventy-seven names; that more dues had been collected than ever before; that the members were well protected by casualty insurance; that the collection department was doing excellent work; and that peace reigned once more between the association and the Chicago Medical Society.

Treasurer C. A. Storer reported disbursements running well into thousands of dollars and a balance on hand, including bonds, of over \$3,500.

The executive committee through its chairman, J. P. Crowley, submitted a report on the work of the past year. In this were reviewed the protective cases, which had showed the good that casualty insurance was doing; the telephone situation, and what the association had been doing to prevent competing companies from operating and lowering the profits of the druggists. The committee was pleased with the results which had been secured through co-operative newspaper advertising, and asked the support of all the members in this work. The report also touched upon the association's relations with the jobbers, which were reported to be co-operative and most friendly. The chairman considered the collection department a valuable asset; and with regard to the ice-cream situation, he spoke regretfully of the set-back received last summer, and advised the members to hang together in protection of their best interests.

The reports of the other committees were all received with much enthusiasm.

Officers for the year were elected as follows: President, B. A. C. Hoelzer; vice-presidents, W. H. Brown, J. J. Chwatal, and E. A. Hartke; secretary, I. M. Light; treasurer, C. A. Storer; trustees, J. P. Crowley, J. F. Forbrich, J. S. Mahaffy, J. J. Boehm, W. H. Armbricht, Edward Williams, Frank Kremer, O. F. Niethammer, and T. F. Cannon.

Purity of Indiana Drugs.

In a recent issue of the *Bulletin* of the Indiana Board of Health it is reported that during the year 1910 the drug laboratory analyzed 444 drug products of which 202, or 45.4 per cent. were found to be at variance with the provisions of the law either as to composition or as to labeling. The results of the analyses are tabulated as follows:

Article Examined.	Legal.	Illegal.	Total.	Per Cent. of adulteration.
Alcohol	2	0	2	0.0
Asthma cure	1	1	2	50.0
Bay rum	1	0	1	0.0
Beeswax, white	1	1	2	50.0
Beeswax, yellow	1	0	1	0.0
Bismuth subnitrate	1	0	1	0.0
Carbolic acid	1	0	1	0.0
Castor oil	9	0	9	0.0
Cough syrup	2	0	2	0.0
Cream of tartar	1	0	1	0.0
Essence of Jamaica ginger	4	1	5	20.0
Essence of peppermint	0	1	1	100.0
Fluidextract of belladonna	6	7	13	53.8
Fluidextract of hyoscyamus	5	7	12	58.3
Glycerin	2	0	2	0.0
Linseed oil	17	4	21	19.0
Lime water	1	0	1	0.0
Oil of turpentine	2	0	2	0.0
Olive oil	14	1	15	6.6
Paregoric	33	20	53	34.4
Potassium nitrate, commercial	4	0	4	0.0
Quinine sulphate (capsules)	2	0	2	0.0
Sulphur	3	0	3	0.0
Spirit of camphor	28	64	92	69.5

Tincture of myrrh	2	0	2	0.0
Tincture of opium	16	13	29	44.8
Tincture of opium, deodorized	8	9	17	52.9
Witchhazel	1	0	1	0.0
Miscellaneous drugs	13	6	19	26.0
Totals	242	202	444 (Av.)	45.4

News of the Pharmacists in the Federal Service.

The following official announcements have been made:

NAVY.

Pharmacist G. H. Klock was detached from the naval medical supply depot at New York and ordered to duty at Fort Mifflin, Pa.

Pharmacist T. N. Phillips, on duty at Norfolk, Va., was retired December 16th.

PUBLIC HEALTH AND MARINE HOSPITAL SERVICE.

Pharmacist G. W. Iltis received a grant of seven days' leave of absence from December 14th.

Pharmacist G. I. Van Ness, Jr., received a grant of nine days' leave of absence from December 21st.

Pharmacist E. B. Scott received a grant of six days' leave of absence from December 19th.

Pharmacist H. Megaw received a grant of two days' leave of absence from December 19th.

Louis Strempel was appointed as a pharmacist of the third class December 14th.

Pharmacist Henry Gahn received a grant of seven days' leave of absence from December 19th.

Pharmacist L. C. Spangler received a grant of three and a half days' leave of absence from December 28th.

Pharmacist F. L. Brown received a grant of seven days' leave of absence from January 2d.

N. A. R. D. Committees.

Harry B. Guilford, of Rochester, N. Y., president of the National Association of Retail Druggists, has appointed the usual standing committees, of which the chairmen, respectively, are as follows:

National legislation—W. S. Richardson, of Washington.

Form of organization—J. T. Roe, of Mobile.

U. S. P. and N. F. propaganda—John G. Krul, of Louisville.

Telephone—W. Bodemann, of Chicago.

Pharmacy laws—M. S. Kahn, of Baltimore.

Fraternal relations—William Ruess, of Cleveland.

Transportation—S. C. Yeomans, of Chicago.

Procter memorial—William Muir, of Brooklyn.

Auditing—Otto Groenland, of Cincinnati.

Canadian Proposed Poison Law.

A bill has been introduced in the Canadian parliament providing that "any person who himself or his agent sells, offers for sale, attempts to sell, exposes for sale or gives away any poison without doing so under the authority of a medical certificate or prescription is guilty of a misdemeanor, and is liable to a fine of not less than \$100 or imprisonment of not more than six months in jail, or both."

The bill does not apply to poisonous insecticides. Provision is made that all poisons be kept and dispensed in characteristic bottles.

Prof. Remington Visits Cuba.

During the holidays Prof. Joseph P. Remington, of Philadelphia, visited Havana, Cuba, and spent two weeks in the island. The Professor was the guest of honor at several banquets during his stay, and met the majority of the men prominent in Cuban pharmaceutical affairs.

As a result of Prof. Remington's visit it is expected that a branch of the American Pharmaceutical Association will be organized at Havana. The Cuban members are desirous of having the association meet at their capital in a year or so.

International Opium Conference.

It is reported from Washington that plans are completed for an international opium conference at the Hague, beginning May 30th next. The countries to be represented are China, Great Britain, France, Germany, Italy, Japan, The Netherlands, Persia, Portugal, Russia, Siam, and the United States. The conference will deal with the problems attending the misuse of cocaine and morphine, as well as of opium.

The *Chemist and Druggist* (London) relates that while an advertisement of a well-known proprietary pill was appearing in a Belfast paper the same paper contained an account of the death of the woman who according to the advertisement had been completely cured by the pill.

News of the Pharmacy Boards.**List of Board Secretaries.**

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

ALABAMA—February 15th, at Montgomery. E. P. Galt, Selma.

ARIZONA—April 12th, at Phoenix. A. G. Hulett, Phoenix.

ARKANSAS—May 8th, at Little Rock. J. F. Dowdy, Little Rock.

CALIFORNIA—Louis Zeh, San Francisco.

COLORADO—S. L. Bresler, Denver.

CONNECTICUT—March 7th, at Hartford. J. A. Leverty, Bridgeport.

DELAWARE—April 4th, at Newark. Albert Dougherty, Wilmington.

DISTRICT OF COLUMBIA—April 13th and 14th, at Washington. S. L. Hilton, Washington.

FLORIDA—D. W. Ramsaur, Palatka.

GEORGIA—C. D. Jordan, Monticello.

IDAHO—April 11th, at Idaho Falls. J. M. Starrh, Shoshone.

ILLINOIS—March 9th, at Chicago. F. C. Dodds, Springfield.

INDIANA—April 11th and 12th, at Indianapolis. W. H. Ruder, Salem.

IOWA—April 4th, at Des Moines. E. J. Moore, Des Moines.

KANSAS—February 15th, at Wichita. W. E. Sherrieff, Ellsworth.

KENTUCKY—J. W. Gayle, Frankfort.

LOUISIANA—May 9th to 11th, at New Orleans. F. A. Earhart, New Orleans.

MAINE—February 8th to 9th, at Augusta. F. W. Bucknam, Skowhegan.

MARYLAND—April 12th and 13th, at Baltimore. Ephraim Bacon, Roland Park.

MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.

MICHIGAN—E. J. Rogers, Port Huron.

MINNESOTA—April 18th, at Minneapolis. C. T. Heller, St. Paul.

MISSISSIPPI—April 4th, at Jackson. L. H. Wilkinson, Greenwood.

MISSOURI—March 13th, at Springfield. C. E. Zinn, Kansas City.

MONTANA—T. M. Kehoe, Billings.

NEBRASKA—February 7th to 9th, at Omaha. A. V. Pease, Fairbury.

NEVADA—May 3d, at Reno. R. L. Prouty, Tonopah.

NEW HAMPSHIRE—February 22d, at Nashua. F. H. Wingate, Nashua.

NEW JERSEY—H. A. Jorden, Bridgeton.

NEW MEXICO—A. J. Fisher, Santa Fe.

NEW YORK—May 24th and 25th, at New York, Albany and Buffalo. W. L. Bradt, Albany.

NORTH CAROLINA—F. W. Hancock, Oxford.

NORTH DAKOTA—March 21st, at Fargo. W. S. Parker, Lisbon.

OHIO—F. H. Frost, Columbus.

OKLAHOMA—J. C. Burton, Stroud.

OREGON—C. G. Huntley, Oregon City.

PENNSYLVANIA—February 18th, at Harrisburg. L. L. Walton, Williamsport.

RHODE ISLAND—February 7th, at Providence. J. E. Brennan, Pawtucket.

SOUTH CAROLINA—March 15th, at Charleston. F. M. Smith, Charleston.

SOUTH DAKOTA—April —, at Brookings. E. C. Bent, Dell Rapids.

TENNESSEE—I. B. Clark, Nashville.

TEXAS—R. H. Walker, Gonzales.

UTAH—April 18th and 19th, at Salt Lake City. W. H. Dayton, Salt Lake.

VERMONT—D. F. Davis, Barre.

VIRGINIA—April 25th, at Richmond. T. A. Miller, Richmond.

WASHINGTON—P. Jensen, Tacoma.

WEST VIRGINIA—May 5th and 6th, at Wheeling. A. Walker, Sutton.

WISCONSIN—April 11th and 12th, at Madison. Edward Williams, Madison.

WYOMING—C. B. Gunnell, Evanston.

District of Columbia Board.

The following applicants for registration were successful at the examination conducted by the District of Columbia Board of Pharmacy, January 12th and 13th:

R. T. Bailey, Jr., J. C. Hardey, R. A. Judd, A. W. Kenner, B. R. Minshall, and Boris Naiman.

The next meeting of the board will be held April 13th and 14th.

Illinois Board.

At the December meeting of the Illinois Board of Pharmacy, held at Chicago, thirteen of the sixty-four applicants for registration as pharmacists and twelve of the thirty-eight applying for assistant's license were successful. They are the following:

As pharmacists—Frank Annibale, Luba Arnopol, Silvio Camodeca, W. J. Carrick, B. C. Chambers, D. N. Fidler, C. J. Oberg, Charles Shipman, and Samuel Zak, all of Chicago; C. C. Carlson, of Calona; R. L. Lindstrom, of Rock Island; Julius Sucherman, of Maywood; and L. R. Wernicke, of Winnetka.

As assistants—Julius Antonow, A. W. Cramer, C. S. Eftaxiopoulos, Samuel Eppelsheimer, A. R. Fortier, J. P. Heinrich, W. H. Hendrickson, W. D. Jenkins, L. P. Levy, F. C. Strickland, Jr., and L. A. Watson, all of Chicago; and R. G. Rosenstone, of Cambridge.

The next meeting of the board will be held at Chicago, March 9th.

Maine Board.

Three of the eight candidates for registration were successful at the examination conducted by the Maine Board of pharmacy at Augusta, December 14th. The names follow:

E. E. Gardner, of East Machias; R. B. Josselyn, of South Hanson, Mass.; and G. L. Wentworth, of Old Orchard.

The next meeting of the board will be held at Augusta, February 8th and 9th.

Massachusetts Board.

But one examination was held by the Massachusetts Board of Pharmacy during the month of December. As usual this took place at Boston. Fifteen candidates for registration were examined and the following were successful:

As pharmacists—A. L. Bourgeois, of New Bedford; Hector Jacques, of Boston; and R. W. Murphy, of Stoneham.

As assistants—E. A. Dunkerton, of Charlestown; E. A. Hamilton, of Roxbury; Harry Korobkin, of New Bedford; P. J. Laporte, of Lowell; A. C. Lussier, of Nashua, N. H.; C. M. Mathews, of Cochituate; and A. E. Ouellet, of Lawrence.

Missouri Board.

An unusually large number of candidates for registration were examined at the meeting of the Missouri Board of Pharmacy, held at Jefferson City, January 9th. The following sixty-six applicants were successful:

As pharmacists—A. I. Allen, of Chillicothe; Leo Barken, of St. Louis; W. D. Bartholomew, of Rockport; Mrs. Alice Bickel, of Mt. View; W. E. Blencoe, of Stanberry; W. E. Bodley, of Kansas City; C. B. Chenoworth, of Webb City; J. M. Clark, of Ulrich; V. Dale, of Linneus; W. E. Davis, of Brookfield; T. A. Doherty, of Gilman City; T. B. Edwards, of Otterville; L. H. Falk, of Sweet Springs; L. Galbraith, of Clark; W. E. Gibbs, of St. Louis; G. R. Goodson, of Hopkins; C. E. Graham and J. C. Haberly, of Kansas City; R. M. Hale, of Purden; H. L. Harrison, of Kansas City; E. M. Herring, of Keytesville; C. A. Herron, of Kansas City; Roy Hoagland, of Brookfield; G. N. Houser, of California; W. P. Hudson, of Columbia; O. Hufford, of Kansas City; J. C. Johnson, of Moberly; C. E. Kessler, of St. Louis; E. J. Knauss, of Kansas City; C. T. Knight, of St. Louis; J. E. Koester, of Glasgow; L. Lange, of Kansas City; C. E. Lee, of Nowata; C. E. Liggett, of Kansas City; C. Lindham, of Troy; W. F. Mangus, of Moberly; M. M. Marshall, of Clark; M. S. Morris, of Mexico; J. T. Neill, of Tina; T. P. Newman, of Dearborn; C. M. Owen, of Brunswick; W. E. Paustian, of Holstein, Iowa; T. E. Payne, of Kansas City; G. Pendleton, of Edgerton; B. W. Rawlings, of Kansas City; C. L. Riley, of Blythdale; E. T. Robbins, of Warsaw; G. B. Rush, of St. Louis; J. O. Sears, of Drexel; T. A. Shoemaker, of Centralia, Kan.; J. T. S'Renco, of

St. Louis; C. D. Stark, of Booneville; M. Stokes, of Craig; H. M. Stunz, S. E. Thomas, and M. B. Tompkins, all of Kansas City; L. T. White, of St. Louis; M. O. Williams, of Warrensburg; and O. G. Wilson, of Centralia.

As assistants—A. W. Blankenbaker and C. F. Ehredt, both of St. Louis; R. L. Fairbrother, of Grange; J. P. Gorsuch, of St. Joseph; T. H. Mitchell, of Brighton; M. B. Tuck, of Morrisville; and G. L. Ziesenis, of Rolla.

Rhode Island Board.

There was but one applicant for registration at the meeting of the Rhode Island Board of Pharmacy held at Providence, January 3d, G. W. Goodrum, of Pawtuxet, who was licensed as an assistant.

The next meeting of the board will be held at Providence, February 7th.

Vermont Board.

The sixteenth annual meeting of the Vermont Board of Pharmacy was held January 3d, at Montpelier. The board adopted the National Pharmaceutical Syllabus as a guide and a standard at its examinations. Eight candidates for registration were examined at this meeting.

The board re-organized for the year and elected officers as follows: President, W. L. Gokay, of Bennington; secretary, D. F. Davis, of Barre; and treasurer, E. G. McClallan, of Rutland. The other members are W. F. Root, of Brattleboro; and M. G. Beebe, of Burlington. Mr. McClallan and Mr. Beebe are the two new members appointed to succeed respectively, J. G. Bellrose, whose term expired December 1st, and W. R. Warner who resigned to accept an appointment to the public service commission.

Virginia Board.

Forty applicants for registration were examined at a meeting of the Virginia Board of Pharmacy held at Richmond, January 3d. Of the number the following nineteen were successful:

As pharmacists—D. Atkinson, of Danville; J. E. Carper, of East Radford; R. L. Clanton, of Altavista; R. L. Frances, of Norfolk; V. A. Keister, of Pulaski; P. S. Lewis, of Richmond; W. S. Lindsay, of Petersburg; J. M. Long, of Lynchburg; W. E. Marshall, of Fredericksburg; S. P. Reams, of Richmond; S. D. Rowland, of Appalachia; and R. B. Sheior, of Richmond.

As assistants—F. T. Butler, of Norfolk; J. D. Coleman, of Appomattox; C. P. Jones, of Union Level; F. D. Jones, of Blackstone; E. C. Thornton, of Warrenton; J. B. Williams, of Richmond; and W. B. Wilson, of Warrenton.

The next meeting of the board will be held April 25th, at Richmond.

At a meeting of the board of trustees of the West Side Savings Bank of this city, held January 10th, Clarence O. Bigelow, theretofore a vice-president of the institution, was elected president to succeed the late Stephen G. Cook. Mr. Bigelow has served the bank for upward of twenty years in the capacity of a trustee and has been chairman of the executive committee of the board of trustees. Mr. Bigelow is best known to pharmacists through his membership on the New York Board of Pharmacy of which he is at the present time the vice-president.

Samuel W. Fairchild, senior member of the firm of Fairchild Brothers & Foster, of this city, has been elected president of the Union League Club of New York. Mr. Fairchild is a prominent figure in local civic and social life, being associated with several financial institutions and a number of philanthropic organizations; is a member of many clubs, and is connected with various municipal institutions.

The firm of Eble & Haines, of Hazleton, Pa., was dissolved December 19th by the retirement of Charles Haines whose interest was purchased by F. X. Eble his partner. Mr. Haines' retirement was caused by his failing health; and he will seek a more salubrious climate in the hope of being benefitted. Mr. Eble plans to make many improvements in the store.

The annual reception and dance of Gamma chapter, Phi Delta Chi Fraternity will be held on Wednesday evening, February 8th, at Duryea's Reception Hall, Suite A, 200 West Seventy-second street, corner Broadway, this city.

J. B. Hazen and W. H. Sanderson, of the publicity staff of Frederick Stearns & Co., of Detroit, Mich., have resigned. Mr. Hazen has come to this city.

Obituaries.

J. WINCHELL FORBES.

Prof. J. Winchell Forbes, of Rossmoyne, Ohio, is dead. In body he had been weak and frail for many years, but in mind, up to the time of his last illness, as alert and active as a boy in his teens. Up to a couple of years or so ago Prof. Forbes was editor of *Drugs and Sundries*, a bright little house organ published by the Stein-Gray Drug Company, of Cincinnati. When this publication went out of existence, its former editor found an outlet for his many bright and original observations in a department of the *Midland Druggist* known as "On the Firing Line."

The deceased was one of the pioneers in California pharmacy, having been a charter member of the first pharmaceutical association of that State, organized in 1869, and its secretary in 1873-4; he was a member (and the secretary) of the first San Francisco Board of Pharmacy, elected by

A. H. HOLLISTER.

J. WINCHELL FORBES.

the members of the State association residing in that city. This was in 1872. He assisted in the organization of the California College of Pharmacy and was professor of pharmacy in that institution in the early seventies. During his later years he was active in the pharmaceutical association affairs of Ohio, and also took a great deal of interest in the American Pharmaceutical Association.

Prof. Forbes was a facile and voluminous writer, and did not confine his efforts to pharmaceutical subjects; he was also a composer, and wrote special marches and overtures for rendition at the meetings of the Ohio and the American associations. He was a man of cheerful and optimistic disposition, and like many other optimists, was an enthusiastic disciple of Isaac Walton. In a letter to a friend written a few years ago he described himself in characteristic fashion as being "president of the ancient and honorable association of bald-headed fisherman, with a membership of three rod-wielders, active, and all the rest of the anglers in the universe, honorary."

Although his life's work had been accomplished, he will be missed and mourned by a wide circle of pharmaceutical friends.

JOSEPH LEROY WEBBER.

Joseph LeRoy Webber, of Brooklyn, as was briefly told in the *CIRCULAR* last month, is dead at the age of fifty-seven years. The deceased was born at Springfield, Mass., October 10th, 1853. He leaves one brother, Arthur Webber, a retail druggist of Springfield. His father was also a druggist of that city.

The deceased was best known to the world of pharmacy through his work on pepsin. He was a pharmaceutical chemist of much more than ordinary ability, and had held positions as such in several large houses. Mr. Webber took first honors in the "Centennial Class,"—the class of '76—in which were 104 graduates, at the Philadelphia College of Pharmacy. In this class were such men as the late Prof. C. S. N. Hallberg, Louis Emanuel, J. O. Burge, Charles W. Tobey, Emil L. Bourner, and Dr. F. E. Stewart.

ALBRECHT WORTMANN.

Albrecht Wortmann, of this city, one of the older members of the New York German Apothecaries' Society, died December 29th, at the age of fifty-nine years. He was born

in Greifrath, Germany, and came to this country in his nineteenth year. Soon thereafter he enlisted in the navy and served as an apothecary there until 1880 when he resigned and started a store in this city. He withdrew from business some eight years ago.

Mr. Wortmann was the first manager of the Consumers' Drug Company, a buying club organized by a number of leading German druggists of this city, the headquarters of which were at his store at Avenue A and East Eleventh street. This club was afterward incorporated as the New York Consolidated Drug Company.

A. H. HOLLISTER.

A. H. Hollister, of Madison, Wis., died recently at the age of sixty-seven years. Mr. Hollister was prominent in public affairs, and in lodge matters, as well as in pharmacy. He was first vice-president of the old National Retail Druggists' Association in 1885-6, and president the following year, when that association became the commercial section of the American Pharmaceutical Association, of which he was the first chairman (for two terms). He had also been president of the Wisconsin Pharmaceutical Association, as well as a member of the board of pharmacy of that State.

Mr. Hollister was a successful business man and left a legacy to the department of pharmacy of the University of Wisconsin.

The following are the recently reported deaths of other persons in the pharmacal world:

JAMES ABBEY, aged eighty-two years, of Dayton, Ohio, December 24th.

ALBERT J. AHERN, of Marlboro, Mass., aged twenty-nine years.

WILLIAM F. ALLEN, of Canajoharie, N. Y., January 12th, aged forty years.

HENRY CLAY ARNOLD, aged sixty-two years, of Kansas City, Mo.

J. L. ASKEW, of West Point, Ga., recently.

C. F. W. BADE, December 6th, at St. Louis, Mo., aged fifty-two years.

GEORGE BAGG, of Springfield, Mass., aged seventy-nine years, January 1st.

CHARLES E. BALL, January 2d, at Holyoke, Mass., aged fifty-nine years.

EDWARD BINSCHADLER, at St. Louis, Mo., December 6th, aged sixty-eight years.

F. M. BLANEY, of Baltimore, Md., January 19th, aged sixty-one years.

D. M. BOWERS, of Sidney, N. Y., December 21st.

JACOB S. BOWMAN, at Pine Plains, N. Y., January 7th, aged sixty-eight years.

CAPTAIN S. L. BRICE, December 26th, at Wheeling, W. Va.

J. H. BRIGGS, aged sixty-five years, of Guthrie, Okla.

F. M. CABLE, formerly of Brainerd, Minn., in this city, December 2d.

HARRY F. CAMPBELL, of Traverse City, Mich., December 5th, aged sixty years.

PHILIP L. COULTER, at McDonald, Pa., January 1st, aged forty-six years.

JOHN W. CONSIDINE, of New Bedford, Mass.

W. H. CRAIG, of Knoxville, Tenn., December 25th.

FOSWELL C. CUTTS, January 4th, aged sixty-eight years, of Brooklyn, N. Y.

JACOB W. DIEHL, December 11th, at Buffalo, N. Y., aged seventy-three years.

B. G. DONZEL, of North Pelham, N. Y.

EDWARD DOSH, of Clinton, Iowa, aged fifty-four years.

WILFRED B. DUBOIS, November 28th, of New Paltz, N. Y.

ALBERT S. ELWELL, aged fifty-seven years, of Bridgeton, N. J., January 3d.

HENRY FLUEGEL, of Brooklyn, N. Y., aged forty-one years.

PETER D. GILCHRIST, of Boston, Mass., aged thirty-four years.

E. E. GREEN, at McIntosh, Fla., aged sixty years.

F. J. GREENE, of Chicago, Ill., December 30th, aged fifty-six years.

GOTTLIEB O. GREINER, of Paris, Texas, aged eighty-three years.

WILLIAM B. GUY, of Middletown, Conn., January 3d, aged sixty-two years.

FRANK M. HALL, of Denver, Colo., December 11th, aged forty-seven years.

Dr. G. S. HANCOCK, aged sixty years, of Campbellsburg, Ind.

JAMES A. HEALY, of Washington, D. C., December 25th, aged sixty-eight years.

A. H. HOLLISTER, of Madison, Wis., December 5th, aged sixty-seven years.

RICHARD HORTON, of Rahway, N. J., January 7th.

SAMUEL A. HUFFMAN, of St. Louis, Mo.

LOUIS JOST, December 21st, at St. Louis, Mo.

FRANK E. KINSMAN, aged seventy-one years, of Augusta, Me.

JOHN C. KLINE, of Ashley, Pa., at Shenandoah, Pa., aged forty-eight years.

ELISHA LEAVENWORTH, of Waterbury, Conn., January 6th, aged ninety-seven years.

Dr. CHARLES J. LINCOLN, of Little Rock, Ark., December 25th, aged seventy-eight years.

SAMUEL L. LORD, January 2d, at Boston, Mass., aged sixty-nine years.

THOMAS LYTLE, of Dayton, Ohio, December 26th, aged seventy-four years.

JOHN MACLEAN, of St. Mary's, Ont., aged seventy-nine years.

R. S. McCURDY, at Kansas City, Mo., aged forty-seven years.

W. H. MACY, of Towanda, Ill., aged seventy-six years.

JOHN MERRILL, of Meridian, Miss., December 6th.

GUSTAVUS J. NEUBERT, aged seventy-seven years, of Kansas City, Mo.

JOHN W. NIECE, of Henry, Ill., aged seventy-five years.

EDWARD D. PEASE, aged fifty-five years, December 13th, at North Bloomfield, Conn.

CHARLES H. PETTET, aged seventy-four years, of Louisville, Ky., January 3d.

ERNEST PHILLIPS, of Frankton, Ind.

HERBERT E. POTTLE, of Andover, Mass., January 3d, aged thirty-five years.

E. E. QUANDT, aged forty-five years, of Baltimore, Md., January 17th.

GRANT RIDENOUR, of Brooklyn, N. Y., aged forty years.

ALEXANDER M. ROBINSON, December 22d, at Bangor, Me., aged sixty-six years.

CHARLES W. RYNARD, of Philadelphia, Pa., January 1st.

THOMAS K. SCHELLER, aged seventy-two years, of Chambersburg, Pa.

CARL W. SEIBERT, aged thirty-five years, of Pittsburg, Pa.

GEORGE R. STEELE, of Thompsonville, Conn., aged fifty years.

HARRY INGALLS SULLIVAN, aged forty-one years, at Nashville, Tenn., December 12th.

H. C. THOMAS, of Dodson, La., at New Orleans.

BYRON E. WEBSTER, at Benton, Ill., aged seventy-three years.

NELSON WEED, of Mankato, Minn., aged sixty-one years, November 19th.

C. A. WEISBROD, aged thirty-nine years, at Oshkosh, Wis.

W. WALLACE WHITE, of Brooklyn, N. Y.

THOMAS WHITE, aged sixty years, of Jersey City, N. J., January 9th.

O. M. WIGHT, December 21st, of Kansas City, Mo., aged fifty-three years.

Henry Wells, president of the Wells & Richardson Company, of Burlington, Vt., died January 7th at his winter home at Miami, Fla., aged sixty-two years. He had been in poor health for a long time and had of late years been away from Burlington much of the time. He was an incorporator of the Burlington Savings Bank and a trustee of that institution. He leaves a widow, one sister and two brothers.

Walter B. Duffy, of Rochester, N. Y., died January 14th, aged seventy years. He was president of the New York and Kentucky Company, a large distilling concern which was interested in a so-called malt whisky bearing his name, and was largely interested in various other industrial concerns.

Mrs. Annie Caswell, wife of John R. Caswell, died of paralysis at her home in Newport, R. I., January 9th.

Two "mail order" "medical institutions" were raided by the postal authorities in this city a few days ago. One did business principally with ignorant foreigners and is said to have had an income of \$3,000 a week. The other was a smaller concern whose receipts were about half that figure. Each was under the supervision of a physician, although the business manager of the larger one was a man who, the police said, had an unsavory race-track record.

To represent the American Pharmaceutical Association at a meeting of the National Civic Federation held at the Hotel Astor, this city, January 12th to 14th, President Eberle appointed a committee consisting of Prof. Charles F. Chandler, Prof. H. H. Rusby, Thomas F. Main, Thomas P. Cook, Dr. William Jay Schieffelin, and Francis B. Hays.

W. H. Ebbitt, city salesman for Schieffelin & Co., and one of the old-time "wheel horses" of the Alumni Association of the College of Pharmacy of the City of New York, Columbia University, has been confined to his home by a prolonged illness. His many friends in the trade will be pleased to learn that he is convalescing.

Wilhelm Bodemann, of Chicago, has begun action in the circuit court at that city, to recover \$25,000 paid in premiums to the United States Life Insurance Company. He charges that the company has failed to carry out the agreement entered into at the time he took out four policies in 1899 and 1900.

The Colorado Board of Immigration, of Denver, is looking for some druggists who wish to locate in that State. Information will be furnished free to those interested.

The Druggists Circular

Entered at the New York Post Office as second-class matter.

Advertisements are inserted under this heading without display except as to a portion of the first line; the charge is at the rate of 25 cents for six words, each figure, abbreviation or initial being considered one word. Terms: invariably cash with order.

THE DRUGGISTS CIRCULAR

A Practical Journal of Pharmacy and General Business Organ for Druggists

VOL. LV. NUMBER 3.

NEW YORK, MARCH, 1911.

WHOLE NUMBER, 651.

Pharmacists as Professional Men.

Before a man may become a pharmacist in this country, and especially in this State, he has to show himself possessed of certain educational qualifications. This was not always so. A generation ago anybody could call himself a druggist and legally make a pretense at filling physicians' prescriptions; and the selling of all kinds of poisons was an every-day event in cross-roads stores throughout the length and breadth of the land. Gradually laws were enacted to put a stop to this condition of affairs, and these laws have been growing in number and putting more and more restrictions around the practice of pharmacy until now either a candidate for license to engage in that practice must be very well qualified for it or the State in which he is examined must be very far behind the times, if he succeeds in getting the desired permit. All over the country the bars around the calling are being raised higher and higher, to the end that the ignorant and incompetent shall be kept out. Every once in a while we hear that another board has elevated its educational prerequisite standard until now it is impossible except in a few of the less progressive States for a candidate even to get a hearing before the examiners unless he has received a good grammar-school education, and in many of the States, considerably more. The public require this of pharmacy for the public's protection, and not for the purpose of protecting those already in pharmacy from the competition of outsiders who would enter.

In exacting so much of pharmacy the public puts itself under some obligation to accord greater official recognition to those who practice it. Pharmacists must be educated men in the first place, says the public, and must be well schooled in the science and art of their calling as well. Then is it anything more than reasonable and just for pharmacists to ask the public for recognition of its claims to the right to representation alongside of physicians on boards of health, in the proposed national bureau of health, and in the higher official ranks of the national guard and the army and navy? We think it is not. Furthermore, we think that as soon as the public becomes aware of the strides that pharmacists are taking in educational matters, and the growth they are making in professional spirit, it will accord to them the recognition due those in their position. Such things take time, however, and we shall have to wait—but should not wait in idleness. On the contrary, we should adopt for our motto the revised version of an old saying, "All things come to him who waits—if he hus-

ties while he waits." Work of the kind we now have in mind is best accomplished through associations. "United we stand, divided we fall." The national and State associations have done much to raise pharmacy's status; they will do much more. Those who want the work to go on should work for, through and in their associations. Druggists should not expect the public to place a higher estimate upon them than they place upon themselves. They can do much to educate the public in matters relating to pharmacy, and an educated public is the strongest ally the profession of pharmacy can have. Yes, pharmacy is a profession, and when pharmacists generally have become professional men through their own efforts and public requirements, they will receive professional recognition and professional honors and emoluments at the hands of the public's servants, the law-makers. Let us all try to hasten that day.

On Reading Books and Journals.

All of us know the old druggist whose library consists of a twenty-year-old and much dog-eared and begrimed dispensatory, a few price-lists, and several odd copies of house organs with here and there a sample copy of a pharmaceutical journal. Yes, we all know him, and some of us laugh and some grieve—according to temperament, or how we happen to be feeling at the time—as we contemplate the picture he makes. Usually poverty is the excuse he offers for the absence of the latest revision of the Pharmacopœia, the current edition of the National Formulary, the newest dispensatory, and the other standard reference books on subjects germane to his calling, and a few journals, and it is heartless to taunt a man for his shortcomings due to lack of money. But is it economy to try to get along without the books and papers? We think not. And is not the poor man the very one who needs them most? We think so. One of our reasons for so thinking is very tersely expressed in a paper read at a meeting of the California Pharmaceutical Association by H. D. Morgan.

This author supposes a case, which one is led to suspect is a true one of which the writer had personal cognizance. He supposes that the druggist receives a prescription for a certain National Formulary elixir and goes to the shelf where Jack Spratt & Co.'s elixirs are kept, and finds the bottle which had contained the one he wants is empty. He continues the story thus:

Then you look among your other elixirs and none there. You begin to feel queer, for the prescription is from Dr.

Grouch, who knocks you and says just because you have the only store in town you feel you can carry just what you like.

Now you begin to wonder and fret; you look for the elixir of terpin hydrate, with the thought of adding codeine sulphate. There's no bottle at all, showing you've not carried it in stock. You suddenly start; there's the dispensatory, a happy thought sure.

You read: "Elixir terpin hydrate and codeine is said to contain terpin hydrate, 1 grain; codeine, $\frac{1}{8}$ grain, to each fluid dram."

Fine—yes—no—but what on earth is the solvent? Aromatic elixir, you suppose, and away you go, only to find that you can't get it into solution. You heat it, and after a while it's dissolved. Oh, happy day, that was easy! You pass it out yet warm, with the chesty air that "I am he who can do it." In a while the customer returns with the color somewhat gone from his tired face. In a hoarse whisper, which shows plainly that he is worried, he says: "I gave her one dose, and when I went to give her the second I noticed all those little needles floating about in it. You didn't make a mistake, did you? Will it harm her?"

Now, Mr. Man, what are you going to do? Sure, you may cuss and blame the clerk who let the last of Spratt & Co.'s elixir go without putting it on the want book. What will that do for you now? Even your dispensatory has gone back on you. . . . You begin to sweat and fret. In the meanwhile your customer waits.

You look at Spratt & Co.'s label to see what per cent. alcohol they use. Forty per cent., says the label. Well, that helps you. Away you go—you try all kinds of mixtures, alcohol and water, from one-third to four-fifths alcohol, but as soon as it is cold the crystals float about poking their thumbs to their noses at you. Then you try glycerin and alcohol, and glycerin, alcohol and water. If you're alone or rushed you are wasting time and money. All at once you get mad because the dispensatory says the National Formulary has the formula, and you haven't any National Formulary. You stand off the customer while in haste you send for the elixir made by Spratt & Co., and with the same mail goes an order for a National Formulary.

Is not that easily recognizable as a true description—except the last line—of a scene which is enacted almost every day in the store of the over-economical man? Such a man saves a dollar or two by not ordering a book, and perhaps every week wastes time worth more than twice as much as that on account of not having the book, to say nothing of the profit he pays "Jack Spratt & Co." for making preparations which he could easily make himself if he only had the formulas, and the loss he sustains by missing sales and driving customers to other stores. Many a time a single note in a single issue of a good pharmaceutical journal pays for that journal for a term of years. "Pays for itself every month," wrote a druggist concerning a little book he bought of us, and we could fill pages of the CIRCULAR with similar testimonials.

There is but one way for the druggist to keep abreast of the times, and that is by providing himself with the later editions of the standard books, and by reading the journals that will keep him posted on the progress that is made in his calling between the times the books are issued. And the doctor soon learns the difference between the druggist who reads and knows and can aid him in his search for the latest word concerning some drug or preparation, and the one who grins shamefacedly or groans resignedly when asked about some new drug or old formula.

Some Results of the Food and Drugs Act.

Notices of judgments rendered by the United States courts in actions brought under the food and drugs act make very refreshing reading. There is a judicial calmness and reserve about them that is really delightful. One turns with a feeling of great relief from the newspapers, with their large type and red ink, indicative of a screaming hysteria, to the brief and straightforward statement of facts recorded in these notices. There is no innuendo, no mud-slinging, no attempt to prejudice the reader either for or against either party to the suit in which the judgment was rendered. When plainly stated facts are sufficient, yelling, red ink, billingsgate and abuse are superfluous.

Over seven hundred of these notices of judgment have been issued by the secretary of agriculture. We have just been looking over a few of the late ones, recently to hand. In one we read how a sample of alleged pure flavoring extract of vanilla was adjudged to be misbranded because "in truth and in fact it was a dilute extract, artificially colored in a manner whereby its inferiority was concealed." The manufacturer entered a plea of guilty and was fined twenty-five dollars. No muck-raking there; no attempt at blackmail or defamation of character. The manufacturer was simply following a "trade custom" of lying about his goods for the benefit of his pocket and to the detriment of the retailer and consumer, was caught at it, convicted, and sentenced to pay a fine. That's all.

In another case the judgment was against a so-called importer and packer of olive oil, who shipped quantities of oil as and for "extra superfine olive oil" when "in truth and in fact it was a mixture of olive oil and cottonseed oil." At the hearing no one appeared to claim the goods, so the court ordered them to be sold. No blare of trumpets there, no fanfare, no shouting from the house top. The dealer knew he had lied to his consumers, he knew that he had been caught, and he knew that he had no excuse to offer other than the old played-out one sanctioned in some quarters by "trade custom," but of no avail in a court of justice, that he needed the money, so he stayed away from the court.

In a third case "pure spirits of turpentine" was found by the government chemists to contain a "large quantity of mineral oil," and was confiscated. Evidently the public has tired of paying turpentine prices for mineral oil, and is rebelling. There is not even the excuse of "trade custom" to put forward for this adulteration, and when that cannot be offered for a practice, it must indeed be a bare-faced fraud.

And here is a "hair grower" put up in small fancy bottles and sold at large fancy prices, because, according to a "trade custom," it bears the lying legend that it "will produce hair on bald heads . . . stops falling hair, keeps the scalp healthy . . . pure and harmless." Upon analysis it was found to consist of a little alcohol, borax, glycerin, and a trace of capsicum, in water. The label was held to be "false and misleading, in that the product would not produce hair on bald heads, and would not stop falling

of the hair." A fifty-dollar fine was imposed. Still, there are people who will go ahead paying several dollars a pint for such mixtures, their faith and hope being as great and as misplaced as are those of the man who, as Knox would say, sows grass seed on an asphalt pavement and expects a lawn. Perhaps a few cold facts from law courts will cool the ardor of these misled ones, and the honest druggist is the man to bring the facts and the consumer together, no matter what the "trade custom" may be.

Great is the work of the administrators of the food and drugs act, although not great enough, of course, to make dishonest people honest; still it is sufficiently powerful to discourage certain kinds of dishonesty by making them unprofitable, and this is a long step in the right direction. When dishonesty becomes unprofitable, young men taken into a business will not be taught from their early youth that it is justified by "trade custom," and so will not receive their commercial education in a school which teaches swindling. That is an end well worth working for, to say nothing of the advantage which comes to honest dealers at the present time through the elimination of dishonest competition. And all this is in addition to the saving to the public. More power to the elbows of the men behind the food and drugs laws.

Merchandizing a Business, Not a Profession.

Whether the practice of pharmacy is a profession or not—and we hold that it is—there is no gainsaying the fact that the selling of hot-water bottles, brushes, soaps, perfumery, books, stationery, lamp goods, candy, soda water, crackers, garden seeds, toys, fireworks, cigars and tobacco, paints, and several other lines of goods, is a business, and the man to succeed at it must exercise business acumen and practice business prudence. Just how he may do these things he can not learn at college, or from reading books and journals, or by attending association meetings and listening to his successful brothers relate their experiences, but if he has the germ of success within him, all these things help to develop it.

Considering the three so-called learned professions, we may say that physicians are proverbially poor financiers, that lawyers are generally able to look out for their own interests, and that the very nature of their work usually precludes clergymen from being reckoned as business men at all. Just where pharmacists as members of a learned profession would rank in a business sense if considered in connection with the three kinds of men mentioned, it is impossible to say, inasmuch as professional pharmacists who are not merchants are so rare as to furnish no basis of comparison, but we hazard the guess that a composite picture of the other three would be a fairly good likeness of the pharmacist.

On the other hand, considering the druggist as a merchant, it would hardly be fair to compare him with strictly mercantile men like the grocer, the hardware dealer, the clothier, the dry goods man, the proprietor of a shoe store, or the haberdasher. Still, the business of merchandizing in such goods as are usually

found on the drug store shelves, except those that are for sale to the sick and afflicted, is a business, and unless conducted in a manner that is found to be advantageous by merchants generally, is almost sure to fail, and leave its proprietor dependent upon his professional practice for a livelihood. This would not be a bad thing for him if there were money enough in this practice to afford him and others similarly situated a good living, with a margin of earnings to lay away for the expected rainy day, but such is not the case in many instances, and even in those instances in which it is the case, the professional pharmacist, like the physician, must still be a good business man in order to achieve the best financial results from the practice of his profession.

All of which is but prefatory to what we have in mind to say, namely, that in this day of chains of drug stores, department-store competition, dispensing by physicians, and the application of sound and progressive commercial methods by individual proprietors to individual drug stores, it more than ever behooves the ordinary pharmacist to make a close study of the business side of his establishment and spare no effort to advance it by the application of the best business methods he can devise. For a writer who has not had long and varied experience in the store to sit at his desk and suggest to a man actually behind the counter what he should do, without becoming platitudinous to the point of ridiculousness, is quite an achievement, and not all who attempt it succeed; but, on the other hand, the druggist who thinks that just because he is so close to it he knows more about his business than it is possible for any outsider to tell him, should remember that the best way to see the beauty of an oil painting is not to stand close to it with a magnifying glass, but to step back a few paces and get a good perspective view; and likewise that a merchant may be so close to his daily routine and to his daily customers as to fail to see opportunities in his position which are plainly visible to a trained eye far enough away to view the situation with reference not only to what is in the store itself, but in its surroundings. And he should never lose sight of the fact that sometimes that trained eye happens to belong to a man who is not a mere arm-chair theorist, but is a good drug merchant looking for an opening for a new store.

There are a thousand and one rules which merchants should keep constantly in mind, ranging all the way from those referring to courtesy in waiting on children, up through others relating to proper buying and attractive advertising, to still others applicable to inventories, insurance and banking. It is not our purpose to attempt to codify these rules or to add to them, but we do most earnestly want to direct the attention of our readers to the value of good business methods, to the necessity for those who are in a rut and are falling back in their receipts to make a change, and to urge all to read the business articles in the journals, including the advertisements. We want them to resolve not to whine if the other fellow gets some of their trade, but to redouble their efforts to win it back and get more; and this not by the fool-hardy practice of cutting prices, but by giving the

people what they want in quality, assortment, courtesy, promptness, inviting surroundings, and by dozens of other ways. We do not offer this little preachment as the only correct guide to a way for their betterment, but we do hope that it will be the means of stirring up some of the dejected, the imperiled, the sluggish, the encysted, and those generally who ought to be making more money than they are, to the end that they may discover the way to their own deliverance from the condition in which they find themselves.

PREREQUISITE LAWS, like other laws, must have a good large proportion of the people behind them if they are to be successfully administered; but prerequisite laws need only the druggist part of the public behind them to make them successful. When the first test vote on the prerequisite clause—to require candidates for board licensure to be college graduates—was taken in the New York State Pharmaceutical Association, and the clause was defeated by the close vote of fifty-four to fifty, Prof. Rusby, who had led the campaign for its adoption, remarked that he would rather have a small majority against the clause than a small majority for it. In other words, he did not want to force the clause on a large and unwilling minority, but preferred to wait a while until all, or nearly all, the members of the association were ready to ask for the change in the law. He did not have to wait long, for the following year the association adopted the prerequisite clause without opposition. This is brought to mind just now by a report to the effect that while the pharmaceutical association of a western State had voted down a resolution declaring that the association wanted the prerequisite clause, the executive committee of the association has reversed this action, in so far as a committee is able to reverse the action of its creator, and decided to ask the legislature of that State for an amendment to the pharmacy law embodying the provision in question. Maybe the way to win the druggists to this innovation is to force upon them unwilling a demonstration of its beauties, but we believe we prefer the Rusby plan to show the rank and file of the craft the advantages of such a law first and then let them ask for, receive and gracefully accept it.

DECEPTIVE ADVERTISING is a bad thing, and we are not now referring to the statements made by advertisers for the purpose of deceiving. Many of these statements are manifestly so written as to carry no weight so far as the sophisticated are concerned. The kind of advertising we have in mind is that which contains advice as to health or beauty, and is printed in the newspapers as the views of the editor or of some contributor, or as clipped from another paper, presumably because the advice was too good not to receive further publicity, when all the time the advertisement is paid for, and contains a recommendation that a certain article be bought and used, just as if it were borax or salt or flour, and not a fake preparation made by the advertiser and sold at a fancy price. At the 1908 meeting of the American Pharmaceutical Association Dr. Lyman F. Kebler read a paper on "Prescription Nostums" in which he quoted at length from many old volumes of THE DRUGGISTS CIRCULAR to show that this form of advertising was in existence as far back

as 1859, when its deceptive nature was exposed by the CIRCULAR in an article on "extract of blodgett." Dr. Kebler stated that since the passage of the food and drugs act in 1906, just two years previously, there had been launched about forty "prescription nostrums." In the discussion following the reading of Dr. Kebler's paper, E. H. Ladish spoke of having heard of a law in Massachusetts which required that newspapers publishing advertisements which might mislead their readers into supposing that they were ordinary reading matter, should print over them the notice, "This is an advertisement," and he wanted the association to formulate a model law on this subject. Whereupon Leo Eliel said that he would like to see congress take action in the matter by excluding from the mails all newspapers carrying the kind of advertisements under discussion; adding that he had recommended something of this kind in his presidential address the year before. We believe it was in this discussion that Mr. Ladish said that when decidedly adverse criticism of this kind of advertising had been made a year or two previously many druggists had cried out, "Oh, you would take the bread and butter from our mouths," but now these same druggists were seeking relief from the burden of carrying in stock such a large and growing assortment of the advertised preparations. Now we are able to report in our news columns this month that a bill has been introduced in congress by Senator Owen, the object of which is to exclude from the United States mails any newspaper or magazine containing advertising masquerading as reading matter, and to provide for a heavy fine for the publisher of such magazines. For the sake of long-suffering druggists, and in the interest of honesty we hope that the bill will become a law.

YELLOW JOURNALISM has long been considered a menace to the country, and much has been said against it by those in a position to address many people. It has remained, however, for a business man of Chattanooga, Tenn., Edward A. Abbott, to take up the fight against this stench in the nostrils of decency as an individual enterprise, and institute a propaganda against it which he is promoting independent of any organized backing. In his correspondence this Tennessee knight uses paper along the margin of which is printed an extract from an article in the *Century Magazine* for last December, in which is quoted the characterization of the yellow press by the mayor of this city as a direct and insidious incitement to disorder. The argument of Mr. Abbott is based on business principles. He believes, and has seen instances which convince him that he is right in this, that the reading of all the most horrible happenings of the day saddens the lives and lessens the efficacy of workers of all classes. He makes his appeal to the employers of help who are at the same time the supporters, through their advertising patronage, of the yellow press. He says: "I shall ask the trade journals of the whole country to furnish the publicity and help to convince the storekeepers and manufacturers that murder and suicide, larceny and divorce, disease and death are not good companions for their advertisements. Together we will show those who have things to sell, the wisdom of cultivating a clientele that is optimistic, joyous and clean-minded—not one that is fearful, saddened and vulgar." He has our best wishes for the success of his gigantic undertaking.

PROF. HALLBERG was so busy during his life-time working for pharmacy that he did less work for himself and family than most men of his ability generally do. In consequence of this, and his unexpected death at a comparatively early age, he left a widow and young son in a house mortgaged for about \$3,500. As his labor was given unselfishly and unstintedly for pharmacy, which has been made richer thereby, it is but just that pharmacy should now do for him that which he found little time to do for himself when alive, provide his family with a home of its own. The American Pharmaceutical Association has undertaken to do this, and proposes to raise by popular subscription enough money to clear the title to the house and lot now nominally owned by Mrs. Hallberg. It has appointed a committee, with members in all the large centers, to receive contributions to this memorial fund, and those who wish to contribute to it and are not waited upon by a member of this committee, may remit direct to the treasurer of the association, Dr. H. M. Whelpley, 2342 Albion place, St. Louis. That the upward of two thousand members who compose the association will drop in the dollar or two each that is needed to complete the fund, is not to be doubted, and they should remember that he gives twice who gives quickly.

DOPING CANDY WITH MORPHINE is pretty near the limit, and yet a confectioners' journal reprints a formula for cough lozenges calling for two drams of morphine in a fourteen pound batch of candy, with a few other ingredients making the total weight of the finished product two or three ounces over fourteen pounds. The author of the formula did not recommend the addition of the narcotic ignorantly or thoughtlessly either, but did so with a full knowledge that "physicians may protest" "but business men cannot be hoodwinked." That the same confectioners' journal which called the drug journals to account for not breaking up the cocaine traffic should print such a formula is certainly most inconsistent, to say the least. Suppose the cough drops are sold at the rate of eighty cents a pound, a high price, then for a "nickel" a child may secure a package of the confection containing over half a grain of morphine—enough for four ordinary adult doses, or from fifteen to twenty-five doses for a child from five to ten years old. Here is work for the health authorities.

PHARMACEUTICAL ASSOCIATION MEETINGS will soon be in order. Winter is with us yet, it is true, the ground hereabouts being covered with snow as these lines are penned, but spring is coming on with a rush. St. Valentine's day, when the birds are said to make their plans for summer housekeeping, will have passed before this issue of the CIRCULAR reaches its readers; Easter, when the spring fishing season used to open for small boys with pin hooks, is nearly in sight; and almost before some of us can turn around three times and then find out which way we are facing, college commencements will be in full swing, with State and Territory association meetings looming up in the not far distant background. And it is gratifying to be able to chronicle the fact that these meetings are growing in number—Arizona having organized an association last year—growing in interest, growing in membership, and growing in value. Druggists who join these associations and attend their meetings thereby not only aid pharmacy through the greater influence they can bring to bear upon leg-

islation and in other ways, but they make better men and better pharmacists of themselves by helping, and receiving help from, their fellows, and by getting out of their stores for a change of scene, air, and general surroundings. We look for the meetings of the State associations this year to make a new high-water mark for attendance, and to set a swifter average pace for work than has yet been attained. So mote it be.

WORK FOR THE RIGHT occupies a large part of the time of many people. Work for what seems to be for their own temporal advantage is likewise done by a large number of people. The incentive of the latter class is so strong that those who are guided by it seem generally to do more, and harder, and more effectual work than is done by the other class; and but for one very important fact the ranks of the idealists would doubtless grow thinner through the disaffection of the disappointed. That fact is this: they seldom have to accomplish the same reform twice—when a question is once settled right it stays settled. On the other hand, those who defend a wrong position, and for the time being win the fight, are sure to be attacked again and again with ultimate defeat sure.

ABUSE THE CHINAMAN as we may for his opium-smoking we must not forget that the greatest hindrance to the suppression of the opium evil in the Flowery Kingdom, so earnestly desired by the authorities there, is the white man's greed for the profit there is in it for him in supplying the drug to the Celestials.

ANOTHER TRADE CUSTOM received a severe blow the other day when a court decided that "all wool" meant all wool, and not part wool and part cotton. It seems a little hard on trade that "trade custom" should be urged as an excuse for ordinary lying.

PHARMACISTS ARE ENTITLED TO SUPPORT from their fellow pharmacists in matters affecting the public welfare only in cases in which they are entitled to call on the public for support.

THE AMERICAN PHARMACEUTICAL ASSOCIATION will hold its fifty-ninth annual meeting at Boston, during the week of August fourteenth.

The *Steward* is authority for the statement that in the Kharkoo region of Russia, the discovery has been made that crabs make an excellent substitute for quinine. The local practitioners pour whisky over live crabs until they are thoroughly intoxicated, and then roast and pulverize them, shells and all. The dose is a dram of the resultant powder, and it is said to cure chills and fever.

The man who has something to make you fat and something else to make you lean appears to be prosperous.—*New Idea*.

Why the "else"? Maybe it is the same thing. Only a short time ago we saw a statement to the effect that one of the principal ingredients of a much-advertised anti-fat was used in some countries for fattening hogs.

"Counting from the shoulders down," says a writer in a contemporary, "every drug clerk has the same value." Not much; unless they are measured with their hands above their heads. Even so, there have been clerks of our acquaintance who were greatly handicapped by a dirty shirt and a slouchy gait.

Making Tablet Triturates.

By JOSEPH LINHART.

Many pharmacists do not know how to make tablet triturates. In fact, during the sixteen years of my connection with the drug trade I have found very few who could make perfect tablets either triturate or compressed. Even tablets purchased from pharmaceutical houses of good reputation I have found very defective in composition, solubility, stability, uniformity, or from variation in strength. I have seen tablets made by supposedly reliable manufacturers which were so hard or so coated with insoluble material as to make them therapeutically worthless if not dangerous.

To be able to manufacture perfect tablets, triturate or compressed, is not only an art, but requires a knowledge of the physical and chemical action of the drugs used.

I shall not delve into the various processes necessary to prepare the many combinations now on the market, but still try to outline a short and accurate method for making the tablets most frequently dispensed at the average pharmacy, and will endeavor to point out mistakes which I have seen pharmacists commit.

Sugar of milk is the most generally used vehicle, although other vehicles, such as sugar, starch, extract of licorice, and sodium chloride are used when necessary, the latter mostly in the preparation of tablets of corrosive mercuric chloride. Although diluted alcohol will answer in most cases, different medicaments require different moistening agents. Care should be taken to choose a moistening agent in which one or more of the tablet ingredients are soluble, so as to promote adhesion. Water, alcohol, ether and chloroform are used at times, alone or mixed, the latter two requiring rapid manipulation. To make a perfect tablet triturate it is essential that only finely powdered drugs be used, so as to insure a smooth surface.

Many pharmacists use talc over the tablets while still in the mould to obtain a smooth surface, but this practice is to be condemned.

The ordinary sugar of milk is not powdered finely enough for the preparation of triturate tablets, and should be bolted through a very fine sieve to remove the coarser particles.

The amount of moistening agent used plays an important part in tablet manufacture, and varies greatly according to the ingredients. The more menstruum used the harder, denser, and heavier the tablet becomes, and vice versa. The proper amount can be gauged only by experience, but enough should be added to make the mass sufficiently cohesive, but not too plastic. I would advise experimenting with sugar of milk until the operator turns out a good appearing tablet, soluble when dry. The hardness can be judged by crushing the tablet under the thumb side ways on the tile. A tablet should crumble without much exertion, but should be sufficiently hard not to break or chip when dropped to the floor. When the operator can make good sugar of milk tablets he can then make many tablets of which sugar of milk is the main component. After the first step is learned the operator should ascertain accurately the weight of one moldful of dry tablets. This should be noted and preserved for future reference. This, of course, varies with the amount of menstruum used, which should also be ascertained and noted.

With this data and training at hand, the operator is now ready to make tablets in which sugar of milk is the main constituent, the weight and bulk of which is not materially affected by the added medicament. By just weighing out the necessary amount of medicament and adding sugar of milk to the required weight, and proper trituration and addition of menstruum, the mold can be filled and then the tablets may be expelled and allowed to dry. Care should always be exercised not to use a filling tool that will have a chemical effect upon the drugs.

A common mistake is making tablets too wet. This causes shrinkage and results in tablets which are not uniform. Therein also lies a serious danger when the active ingredient is soluble in the menstruum, which oozes out on the under side and, containing most of the active principle, is left behind on the tile, with the result that the tablet is deficient in strength.

Here is another important factor which must be taken into consideration: when the active constituent is of a higher gravity than milk sugar, as is the case with calomel and other mercurials, lead and bismuth compounds, etc., the loss in bulk must be made up by the addition of sugar of milk; and the quantity of sugar of milk must be lessened when the active ingredient is lighter. Failure to observe these points accounts for the shortage or left over mass which pharmacists who have made tablets surely must have noticed.

Certain combinations can be made into tablets only by compression, and separate granulation and subsequent mixing, for if mixed all together and moistened, chemical reaction occurs, and a tablet results different from the one intended. A good example of this class of combination is calomel and sodium bicarbonate.

Tablets should never be subjected to high temperature in drying, especially when the medicament is of a volatile nature, or soluble in the menstruum used. This is particularly true of tablets which are other than white, for the evaporation quickly taking place from the exposed side, the menstruum draws the color to that side, which, therefore, when dry, will be darker than the under side.

A good drying cabinet can be made with little expense out of an ordinary box without bottom, one side of which should be hinged to serve as a door. Cleats are nailed to the sides to serve as rests for frames. The frames are made from narrow strips to slide easily into the box and rest on the cleats. These are covered with ordinary cheese cloth so as to form a sieve. The box should have an air vent to allow escape of moisture at the top. Such a drying cabinet, used over a register or steam radiator, is most serviceable, and permits an even drying of the tablets. The tablets are distributed over the cheese cloth and so inserted into the cabinet. Wire sieves are not so good, as they are apt to rust and affect the tablets.

Narcissine, an Alkaloid from Daffodil Bulb.

Ewins has described (Proc. Chem. Soc. through *Journ. Soc. Chem. Ind.*) an alkaloid isolated from the bulb of the common daffodil (*narcissus pseudonarcissus*). This derivative which the author calls narcissine he showed to have the formula $C_{18}H_{17}O_4N$. It melts at from 266° to 267° C.; is levorotatory; is very stable; and contains no methoxy groups. The hydrochloride also was described.

Hoist with His Own Petard.

By THE STROLLER.

According to the story which is now unfolding itself, there was once a grocery clerk who tired of working twelve hours a day, six days in the week, Sundays and holidays "off." So he said to himself, I'll open a drug store and get rich quick without work or worry. It looked so easy to him that he wondered everybody hadn't thought of it already. This was before the pharmacy law was passed.

So the clerk opened a drug store, and as he had decided not to worry, he turned down a proposition that he buy a set of apothecaries' weights and measures, insisting that he could get along better with a system with which long use had made him familiar. He knew that four gills make a pint, and the talk of sixteen ounces making a pint confused him: sixteen ounces made a pound with him, and while he was well aware that "the old man" had sometimes trimmed the number down to fourteen, he was not prepared to go him two better, as he learned that druggists were in the habit of doing, and let it go at fourteen—no wonder druggists got rich quick!

Well, he opened his store, as has been stated before, and some business began to come his way. A fellow dropped in with a prescription calling for 1 ounce of a certain powder, 2 ounces of an extract, $1\frac{1}{2}$ ounces of something else, and so on. A drug clerk who was helping about the place told the new druggist that in prescription work an ounce meant a troy ounce (the word "apothecaries" was too long and confusing), and by reference to a table the new druggist found that 1 troy ounce was the equivalent of $1\frac{17}{175}$ grocery ounces. (The discriminating reader will note that he did not bother with decimal fractions, for he did not intend to worry a bit.) Just how he weighed $1\frac{17}{175}$ ounces may never be generally known, but he says he had it right and he probably knew if anybody did. That $1\frac{1}{2}$ ounces almost got him to worrying at first, as its equivalent was not set down in the table; but the equivalent for $\frac{1}{2}$ ounce was, and by adding this, $\frac{96}{175}$, to the equivalent for 1 ounce, $1\frac{17}{175}$, he obtained $1\frac{113}{175}$, grocery ounces, the required combination.

When it came to a matter of fluid ounces he used his gill cup, which he called four ounces, and so, by division and multiplication, and now and then by addition and subtraction as well, and even a tough wrestle with complex fractions on occasion, he calculated the quantities he wanted. All this he did to avoid worry, for life, at best, is short, and should be spent to the best advantage.

It might as well be stated here as anywhere else in this disquisition, and it must be stated somewhere, else the same will not be complete, that the ex-groceryman always stuck to his grocery weights and measures, and to his table of equivalents, and contended vigorously that the apothecaries' system was a most complicated affair, necessitating endless "converting" and figuring in all sorts of inconvenient fractions.

One day he and an old druggist were discussing things in general, when the former grocery clerk's method of weighing and measuring was mentioned. The old druggist attempted to point out the error of the new recruit's course, but the latter would not have it that way. One thing brought on another, and the old druggist soon waxed abusive. He called

the ex-groceryman all kinds of a long-eared equus asinus, and a dunder-head, and even applied to him a shorter and uglier word which well brought-up boys know that one should never apply to a brother—even a brother druggist.

Naturally matters were warming up, when along came another druggist, and luckily he was one who had the reputation of being strictly up-to-date and the smartest man in the business in that town; he could settle the dispute in short order, so they both turned to him.

The smart druggist listened to the statement of the case, and of course the old druggist felt perfectly sure in advance what the decision would be. But the smart druggist did not seem to be convinced.

"You say this man is a dolt and a chump and an idiot," he began. "Now, tell me again and dispassionately what you base your charges on?"

The old druggist explained once more, and with greater calmness and attention to detail, just why the other fellow ought to be unanimously voted a blockhead and a donkey. In short it was because when he filled a prescription written in the apothecaries' system of weights he did not use those weights, but insisted upon "converting" the quantities into the equivalents in the avoirdupois system, and using avoirdupois weights. This one fact, he insisted (and who shall say without a show of reason?), established the correctness of his contention that the other fellow was all that he had said he was, and perhaps a little more and worse.

Then the smart druggist began to show his hand. "Perhaps you are right," he said, "but before we condemn this man unconditionally let us inquire into some of your customs. When you receive a prescription calling for grammes, and cubic centimeters and such, do you employ gramme weights, cubic centimeter measures, and so on, or do you turn to your table of equivalents and do a little 'converting' on your own hook?"

The old druggist, evidently somewhat taken aback, stammered: "Oh—well—of course—that's different. —I—"

"How? Wherein is it different?" This in a cold, relentless tone of voice from the arbiter.

"I—you see—anyhow, I was brought up to use apothecaries' weights and measures and know all about 'em. All this new-fangled talk —." But he did not get any further. He did not know what more to say. Indeed, it seemed that there was nothing more he *could* say.

The smart druggist gave him a withering look and walked off in disgust. The only comment he deigned to make was—

"Who's loony now?"

Relation of Eye Adjustment to Epilepsy.

Stevens (*N. Y. Med. Journ.*) states that his later experience has led him to believe that iodopathic epilepsy is, in a great proportion of cases, the result of the condition of tilting of the meridians of the eyes which he has called declinations, and for some years past his efforts toward relief of these cases have been directed toward the correction of this defect. Although such a correction is sometimes extremely difficult and demands much patience and infinite care, the results have been on the whole most satisfactory.

Some Dispensing Notes.

At the January meeting of the Edinburgh Chemists' Association, J. D. Watson offered notes on the dispensing of two prescriptions as follows:

I.

Iron protochloride..... 2 grains.
Aloin ½ grain.
Make a pill.

Powdered tragacanth and syrup; mucilage of acacia; and anhydrous wool-fat were tried as excipients. Mr. Watson's conclusion was that if the pills are to be kept for any time, especially if not kept in a tightly closed bottle, wool-fat is the only satisfactory excipient.

II.

Balsam of peru..... 2 drams.
Syrup of tolu..... 4 drams.
Compound tincture of camphor.... 1½ drams.
Water..... enough to make 4 ounces.

The simplest and most satisfactory process was to add the balsam gradually to a freshly prepared mucilage made of 2 drams of acacia and 3 drams of water; then to add more water, and finally the syrup and the tincture.

At the same meeting George Elliot commented as follows on a number of prescriptions:

III.

Precipitated sulphur..... 1 dram.
Precipitated calamine..... 4 drams.
Zinc oxide..... 4 drams.
Glycerin 1 dram.
Water..... enough to make 4 ounces.
Make a lotion.

The powders should be well mixed together and then rubbed into a paste with the glycerin and a portion of the water. The rest of the water should be added in small portions, the sides of the mortar and the pestle being scraped after each addition. When the finished product is poured into the bottle any gritty particles should be left behind. In standing, the sulphur will sink. ["Lac sulphur" containing calcium sulphate is the sort used by the "beauty doctors" in their homogenous suspensions.—Editor THE DRUGGISTS CIRCULAR.]

IV.

Phenalgine 4 grains.
Exalgine 1 grain.
Acetyl-salicylic acid..... 8 grains.
Caffeine 2 grains.
Make a powder.

It was found that the only way to dispense these ingredients in other than a pasty mass, was to put up the phenalgine separately.

V.

Ferrous arsenate..... 1/12 grain.
Potassium carbonate..... 2½ grains.
Ferrous sulphate..... 2½ grains.
Make a pill; dispense 24.

In dispensing this, an equivalent quantity of dried ferrous sulphate (40 grains) was used. The potassium carbonate was dissolved in 20 grains of water; the ferrous sulphate triturated with this; the ferrous arsenate was added, and the mass set aside for ten minutes; four grains of powdered tragacanth was beaten into the mass which was then quite workable.

VI.

Silver nitrate..... 2 drams.
Aluminis [!]..... 4 drams.
Distilled water..... enough to make 8 ounces.

A tablespoonful to be diluted with half a tumblerful of water for a gargle.

Although the precipitated silver sulphate is soluble in the proportion of water represented by the diluted gargle the precipitate is so heavy that it can scarcely be diffused well enough to permit accurate division in pouring out portions of the prescribed liquid. To obviate this the salts were dissolved in enough water to make 16 ounces, and the directions changed accordingly.

VII.

Sodium bicarbonate..... 3 drams.
Bismuth salicylate..... 3 drams.
Spirit of chloroform..... 6½ drams.
Infusion of gentian..... enough to make 8 ounces.

To hasten the interaction between the salts 1 dram of sodium bicarbonate and the bismuth salicylate were heated together with water until the reaction was completed. After this had cooled the mixture was prepared as directed. Mr. Elliot cautioned against the use of bismuth carbonate to replace the salicylate, as is often done when the subnitrate is prescribed with an alkaline carbonate, because, if on another occasion the mixture was dispensed as written, the characteristic taste of sodium salicylate would have a disquieting effect upon the patient.

VIII.

Terebene 1 dram.
Compound tincture of camphor..... 3 drams.
Aromatic spirit of ammonia..... 4 drams.
Water..... enough to make 3 ounces.

Mr. Elliot had found that with 1 dram of tincture of quillaja the foregoing might be made into an emulsion satisfactorily. E. J. Brown was of the opinion that the use of tincture of quillaja in a medicament for internal use was objectionable because of the physiological effect of quillaja, and in this we agree with him.

Reform in Advertising.*

While pharmacy is a profession, economic conditions, to a large extent, have made a tradesman of the owner of a drug store. As such he is obliged to sell many things which, in view of his professional training, he knows the public would be better off without. In the same way, the drug journals advertise many things which the editor knows to be valueless or worse. Further, the editor must conduct his reading pages in such a way as not to give offense to his advertising patrons. Thus, while editors of drug journals like to talk about the ethics of pharmacy and are prone to indulge in glittering generalities as to the need of pharmaceutical advance, these editors have, as a rule, carefully refrained from noting the exposures of fraudulent medicines that have appeared in the columns of the *Journal*—exposures that supplied information which the pharmacist should have and must have if he is to be true to his profession; information that would enable him to protect the public, the physician and himself from the harm which ensues from

*Editorial article in the *Journal of the American Medical Association*.

the use of dishonest medicines. While thus, in general, drug journals have done little to spread the *Journal's* propaganda for reform, there have been two notable exceptions—THE DRUGGISTS CIRCULAR of New York and the *American Journal of Pharmacy* of Philadelphia. These journals have not only kept their reading pages up to date, but they have kept their advertising pages practically free from all objectionable matter. We believe that, through the work initiated by the *Journal*, assisted by such drug journals as those mentioned, the nostrum-makers have been put on the retreat, and that the business will continue to be a dwindling one. Other pharmaceutical journals will not lose in the long run, even from a purely commercial standpoint, by taking the position assumed by THE DRUGGISTS CIRCULAR and the *American Journal of Pharmacy*. In fact, we confidently expect them, one by one, to adopt the same policy. By so doing they will not only gain the respect of their own profession and of the medical profession, but—equally important—they will also be able to respect themselves.

Some Nostrums, Fakes and Deleterious Preparations.

At the 1910 meeting of the North Carolina Pharmaceutical Association Dr. L. F. Kebler, chief of the drug division of the bureau of chemistry, United States department of agriculture, was an invited guest and delivered a lecture on "Ethics in the Drug Business." After suitable introductory remarks, and some observations on business honesty, charlatany and the work of his bureau, Dr. Kebler paid his respects to some of the more notorious of the concerns which are engaged in what he was pleased to term "humbugging the people," as well as to some of the more disreputable preparations. Some quotations from his address follow:

RADOL.

The vicious type may be illustrated by a so-called cancer cure. It was extensively exploited in the papers under the name "radol." According to the claims, no case was so far advanced that it could not be successfully treated by this remedy. The scheme was promoted by a graduate in medicine, under an assumed name, and an advertising agency. It was advertised as radium-impregnated—radio-active—if you please. Examination, however, showed that the nostrum was no more radio-active than ordinary hydrant water. It consisted of two one-half gallon bottles of liquid. One was rendered fluorescent by means of quinine sulphate so as to deceive the unfortunate victim, and the other was little more than plain water. This wicked fraud was put out of business by a postal fraud order. . . .

HUMBUG OIL.

It is a trite saying that the American people like to be humbugged, and certain interests have worked it to a frazzle as is exemplified by the scene* before you representing "humbug oil." You will observe that Mr. Humbug is in the act of gathering the "humbugs" to be used in making the humbug oil. It is a humbug, indeed.

TURTLE OIL.

Another of a similar type is represented by the article known as "turtle oil." As can readily be seen from the composition given on the slide, it is a base imitation.

BEAVER OIL.

This product also calls to mind the article exploited under the name "beaver oil," which consists of a weak solution of capsicum in gasoline, the mixture being flavored with essential oils. It is exploited by regular street-faking methods. Live beavers constitute a part of the dem-

onstration for the purpose of deceiving the gullible purchaser.

CASTOR OVALS.

The medicinal properties of castor oil are well known to the public, but on account of its nauseating taste it is not well received. This fact is taken advantage of by the preparation formerly known as "castor ovals." It is represented as "the only castor oil confection." The product, however, does not contain anything derived either from the castor oil plant or sugar. The active principle is senna and the sweetening properties are imparted by the chemical known as saccharin.

RATTLESNAKE OIL LINIMENT.

Examination of this product revealed the fact that there was at most only a suggestion of rattlesnake oil present. The manufacturer ultimately confessed to this and asked whether he would not be permitted to call the production by the above name if it contained $\frac{1}{3}$ of an ounce of genuine rattlesnake oil to the gallon. . . .

VIBRO-DISCS.

Vibro-discs come in pairs of two distinct types. One pair consists of a circular portion of ordinary oil cloth partly covered on one side with a resin plaster, and on the other side of one of the pair is a small plate of zinc. The other disc of this same pair contains a copper plate instead of a zinc plate. Beneath the copper and zinc plates the oil cloth is perforated. Externally each entire disc is covered with a piece of gauze. The second type of discs is similar to that just described, except that the plates of zinc and copper and the gauze covering are omitted. Examination of the plaster covering one side of the discs shows that they are composed largely of some of the cheapest drugs employed in medicine, namely, burgundy pitch, resin, oil of tar, sugar, poke root, kaolin, capsicum and belladonna. The directions given for the use of the vibro discs are that the pair of discs containing the metallic plates must be warmed, separated from each other while warm, and applied before they become cool to the soles of the feet. The second pair of discs is to be separated in the same manner and applied to the chief regions of pain. Immediately after the application of the discs it is claimed that there is an electric vibration communicated to the blood, which causes a speedy removal of the rheumatic venom, the source of this electrical vibration being the two plates of copper and zinc, respectively, forming a part of the vibro-discs. The general principle employed of producing electricity by two different metals is based on scientific principles, but the conditions under which the discs are applied absolutely prevent the formation of any current of electricity. The electric current is also claimed to be imbued with the power of causing the uric acid to be attracted to the discs and to be absorbed thereby. There are a number of devices of this type on the market, among them being *electropodes* and *magic foot drafts*.

EYELIN.

This represents one of the most palpable frauds ever met with. It is exploited as a panacea for all abnormalities of the eye, such as cataract, short-sightedness, infirmities due to old age, etc. It consists of flavored vaseline. The price of a single box containing about $\frac{1}{4}$ of an ounce is \$1. The promoter of this remedy, a physician, made a net profit during the year just previous to its collection, of \$50,000.

GLYCOZONE.

This product is described as a mixture of glycerin and hydrogen peroxide, and is claimed to liberate ozone in the stomach. As a matter of fact, it is a mixture of glycerin and glyceric acid, and the most vivid imagination could not conjecture a condition in the stomach under which one iota of ozone would be liberated. . . .

Dr. Kebler had some pointed remarks to make concerning the all too well-known acetanilide headache remedies, the so-called cod liver oil preparations which contain no oil, the consumption and cancer "cures," the soothing syrup which soothes by dosing the patient with morphine, and then said a few words about a matter which has assumed alarming proportions of late. Further quotations are given:

Your attention is particularly called to the product known as "Espey's syrup for children's dentition" con-

*Dr. Kebler used a stereopticon to illustrate his lecture.

taining a declared amount of cocaine hydrochloride. It is hardly believable that anyone for the sake of a few dollars would concoct for infant use such a pernicious mixture.

MEDICATED SOFT DRINKS.

After babyhood the child is introduced to another line of products which contain greater or smaller quantities of habit-forming agents, namely, some of the so-called medicated soft drinks. A large number of them contain not only caffeine but also cocaine. A considerable number have already been prosecuted under the federal law for containing ingredients which render them deleterious to health. Several State legislatures are actively engaged in curtailing them. These products have been placed on the market largely during the past twenty years. On account of insufficient information they were formerly looked upon as comparatively harmless, but they are now known to be an impending evil. Centuries before cocaine was introduced as a remedial agent, wonderful accounts of the energy-creating properties of coca leaves were chronicled. Impetus was given to this belief by the enthusiastic reports of the virtues of this drug published not only in medical literature but in the secular press as well. Cocaine is one of the most insidious and dangerous habit-forming agents known. Kola nut was prominently brought forward about twenty-five years ago as an agent for the relief of fatigue, but in this respect it has been a disappointment. Whatever virtue this product does possess is due to the caffeine it contains. In the drinks on the market caffeine has almost entirely replaced the kola nuts. The purported virtues of coca leaves and kola nuts have been largely exploited, and it was only natural that they should be combined in preparations which would represent the virtues of both. It is not uncommon at present to find persons addicted to the use of drinks of this type. It is well known that parents, as a rule, withhold tea and coffee from their children, but having no knowledge of the presence of caffeine, cocaine and other deleterious agents in these soft drinks, they unwittingly permit their children to be harmed by their use.

In passing it may be of interest to note that life insurance companies are considering the status of soft drink habitués as future risks.

In conclusion Dr. Kebler spoke of drug addiction and told how there were offered as cures for drug habits, nostrums which contained large proportions of the habit-forming drug. He also touched upon the evil done by cocaine pedlers, and upon other topics of a germane nature.

Aids to Success.

The success of a drug store, said D. J. Kuhn, in the *Retail Druggist*, depends upon its management, the stock carried, judicious advertising, competent employees, and giving to everyone entering the store a square deal. First he put the manager who should have a knowledge of the multitude of details characteristic of the drug business, and the ability to select satisfactory assistants. Next in order, Mr. Kuhn named a well-selected, well-displayed stock, calling particular attention to the trade-attracting value of artistically designed window displays of one thing at a time. Prompt delivery, package slips, an adequate lighting system, and a well-used mailing list were favorite trade-getting aids in Mr. Kuhn's business. He had also found it profitable to keep his prescription department spotlessly clean, from spatulas to sink, and to invite physicians to inspect it.

Antiseptic Tooth-Wash.

Thymol	2.5 grammes.
Benzoic acid.....	25.0 grammes.
Tincture of eucalyptus.....	125.0 grammes.
Oil of peppermint.....	8.0 grammes.
Alcohol (90%)....to make	1000.0 c.c. (mils).

Elm Bark to Preserve Lard.

R. M. Altmann, a recent graduate of the Massachusetts College of Pharmacy, doubtless has a well developed bump of adaptation. He had heard that to preserve their winter's store of bear's grease the Amerinds (as the ethnological sharps have renamed the aboriginal red-men) melted the fat with shredded elm bark. The physical difference between the fat of the bear and that of the pig is not great; and Mr. Altmann experimented with the preservative properties of the bark of *ulmus flavus* as applied to lard.

In his graduation thesis he told how he had prepared some purified leaf lard and melted it on a water-bath with pieces of elm bark in the proportion of 2 drams to the pound of fat. When the bubbles had ceased to rise, indicating that all the moisture had been expelled, the lard was strained and stirred until cool. The product was divided into a number of portions and exposed to the atmosphere at different temperatures for three weeks. At the end of that time none of the samples gave any indication of rancidity when tested with Schiff's reagent. An ointment of potassium iodide made with a sample of this lard without the addition of any potassium carbonate remained uncolored after a week's exposure to the atmosphere.

Mr. Altmann believes that the preservative influence of elm bark is due to the clarifying action of the albuminoids it contains and the dehydrating action of the gum.

Rose-Almond Cream.

Blanched sweet almonds.....	50 grammes.
Castile soap.....	3 grammes.
White wax.....	3 grammes.
Oil of sweet almonds.....	3 grammes.
Spermaceti	3 grammes.
Oil of bergamot.....	3 grammes.
Oil of lavender flowers.....	1 gramme.
Oil of rose geranium.....	1 gramme.
Alcohol (90%).....	75 grammes.
Rose water.....	300 grammes.

Pound the almonds to a smooth paste, and emulsify with the rose water. Melt the soap, the wax, and the spermaceti in the almond oil at a gentle heat; transfer this mixture to a warm mortar and add little by little the emulsion of almonds with constant trituration. Dissolve the aromatic oils in the alcohol and add in divided portions to the other ingredients.

A Simple Gilding Dip.

According to the *Keystone* metallic articles may be gilded by supporting them upon a clean piece of zinc immersed in a solution made as follows:

Fine gold.....	6 grains.
Nitro-hydrochloric acid.....	enough.
Potassium cyanide.....	36 grains.
Hot water.....	1 pint.

Heat the gold on a sand bath with sufficient acid to dissolve it, and when it is dissolved, add the solution to the water in which the cyanide has been dissolved. Stir with a glass rod; filter through paper if necessary.

Before it is applied, this gilding solution should be heated to about 180° F.

O. Henry as a Druggist.

Not very long before his death, O. Henry, to use his pen name, or William Sydney Porter, to be exact, was "written up" in the CIRCULAR (for March, 1909, page 162) as a druggist. He began his career as a handler of "salts" and soda water in the store of his uncle, W. C. Porter, of Greensboro, N. C., of which town he was a native. It is said that he also worked in a drug store in Texas for a short while, and in the dispensing department of an institution in Ohio for a longer period, but as to the truth or otherwise of these statements the writer hereof is in ignorance. He has been in the old Porter store, however, and has talked to people in Greensboro who knew the young man who afterward became famous as the most popular short story writer of his day. O. Henry himself has been quoted as saying that he was not a druggist and that many published accounts of his life (about which there seems to have been much mystery) made him smile by being so wide of the mark.

In one of his inimitable stories,* O. Henry tells of a Denver lawyer who had—or pretended to have (the author leaves us in some doubt as to this point)—an attack of aphasia, and while so affected found himself on a train bearing a number of Western delegates to a meeting of a national pharmaceutical society to be held in New York. We believe that no druggist can read the author's own account of what followed without realizing that he had a more intimate knowledge of the business than could have been secured by the perusal of an encyclopedia in search of facts and names. He says:

The car was well crowded with men, among whom, I told myself, there must have been some common interest, for they intermingled freely and seemed in the best good humor and spirits. One of them—a stout, spectacled gentleman enveloped in a decided odor of cinnamon and aloes—took the vacant half of my seat with a friendly nod and unfolded a newspaper. In the intervals between his periods of reading we conversed, as travelers will, on current affairs. I found myself able to sustain the conversation on such subjects with credit, at least to my memory. By and by my companion said:

"You are one of us, of course. Fine lot of men the West sends in this time. I'm glad they held the convention in New York; I've never been East before. My name's R. P. Bolder—Bolder & Son, of Hickory Grove, Mo."

Though unprepared, I rose to the emergency, as men will when put to it. Now must I hold a christening, and be at once babe, parson and parent. My senses came to the rescue of my slower brain. The insistent odor of drugs from my companion supplied one idea; a glance at his newspaper, where my eye met a conspicuous advertisement, assisted me further.

"My name," said I, glibly, "is Edward Pinkhammer. I am a druggist, and my home is in Cornopolis, Kan."

"I knew you were a druggist," said my fellow traveler, affably. "I saw the callous spot on your right forefinger where the handle of the pestle rubs. Of course, you are a delegate to our National Convention."

"Are all these men druggists?" I asked, wonderingly.

"They are. This car came through from the West. And they're your old-time druggists, too—none of your patent tablet-and-granule pharmashootists that use slot machines instead of a prescription desk. We percolate our own paragon and roll our own pills, and we ain't above handling a few garden seeds in the spring, and carrying a side of confectionery and shoes. I tell you, Hampinker, I've got an idea to spring on this convention—new ideas is what they want. Now, you know the shelf bottles of tartar emetic and Rochelle salt Ant. et Pot. Tart. and Sod. et Pot. Tart.—one's poison, you know, and the other's harmless. It's easy to mistake one label for the other. Where do

druggists mostly keep 'em? Why, as far apart as possible, on different shelves. That's wrong. I say keep 'em side by side, so when you want one you can always compare it with the other and avoid mistakes. Do you catch the idea?"

"It seems to me a very good one," I said.

"All right! When I spring it on the convention you back it up. We'll make some of these Eastern orange-phosphate-and-massage-cream professors that think they're the only lozenges in the market look like hypodermic tablets."

"If I can be of any aid," I said, warmly, "the two bottles of—er—"

"Tartrate of antimony and potash, and tartrate of soda and potash."

"Shall henceforth sit side by side," I concluded, firmly.

"Now, there's another thing," said Mr. Bolder. "For an excipient in manipulating a pill mass which do you prefer—the magnesia carbonate or the pulverized glycyrrhiza radix?"

"The—er—magnesia," I said. It was easier to say than the other word.

Mr. Bolder glanced at me distrustfully through his spectacles.

"Give me the glycyrrhiza," said he. "Magnesia cakes."

We arrived in New York about ten at night. I rode in a cab to a hotel and wrote my name "Edward Pinkhammer" in the register.

I thought the hotel clerk looked at me five seconds too long. I had no baggage.

"The Druggists' Convention," I said. "My trunk has somehow failed to arrive." I drew out a roll of money.

"Ah!" said he, showing an auriferous tooth, "we have quite a number of the Western delegates stopping here." He struck a bell for the boy.

I endeavored to give color to my role.

"There is an important movement on foot among us Westerners," I said, "in regard to a recommendation to the convention that the bottles containing the tartrate of antimony and potash and the tartrate of sodium and potash be kept in a contiguous position on the shelf."

"Gentleman to three-fourteen," said the clerk, hastily. I was whisked away to my room.

Finally the wife of the hero follows him to New York and when she embraces him and calls him by name, what follows is thus told:

I unwound her arms respectfully, but firmly.

"Madam," I said, severely, "pardon me if I suggest that you accept a resemblance too precipitately. It is a pity." I went on, with an amused laugh, as the thought occurred to me, "that this Bellford and I could not be kept side by side upon the same shelf like tartrates of sodium and antimony for purposes of identification. In order to understand the allusion," I concluded airily, "it may be necessary for you to keep an eye on the proceedings of the Druggists' National Convention."

Valuation of Perborates.

To determine the amount of available oxygen in perborates, which are coming into wide use as bleaching agents, Bosshard and Zwicky (*Apoth. Zeit.*) direct that a weighed quantity of the perborate be introduced into a 100-c.c. (mil) flask, and mixed with three or four times its weight of pure manganese dioxide. A small test-tube containing 10-per cent. sulphuric acid is introduced into the flask which is then fitted to a graduated eudiometer tube. The test-tube is then inclined so as to bring the acid solution into contact with the mixed salts. When the reaction has ceased the volume of evolved gas is read off (with the usual corrections for temperature and pressure). Half the oxygen liberated is derived from the perborate; therefore the desired percentage may be determined thus: When a = the weight of the perborate, and b = the volume of gas evolved, the percentage of available oxygen = $16b/224a$ at 0°C ., and 760 m.m. pressure. If carbonates be present the gas must be washed with solution of sodium hydroxide.

Physiological Laboratory Notes.

MODIFICATION OF TEICHMANN'S TEST FOR BLOOD.

Teichmann's test for the identification of blood is carried out by transferring a small drop of the liquid under examination to a slide, spreading it out with a glass rod, adding one drop of a 1/10 per cent. sodium chloride solution, and evaporating the mixture to dryness on a water-bath or over a small flame. The residue is then covered with a cover-glass and on the edges of the latter one or two drops of glacial acetic acid are placed. The slide is then heated gently, adding if necessary one or two drops more of glacial acetic acid until the space between the slide and cover-glass is filled with acid. When viewed through a microscope rhombic, yellow-brown needles of hematine hydrochloride, commonly called hemine crystals, can be seen, if blood is present. Déniges (*Bull. soc. pharm. Bordeaux*, through *Rép. de Pharm.*) has found that this process as well as Eyssoutier's and Strzyzowski's modifications are not sensitive enough and he proposes the following method for detecting blood. This method differs from that of Teichmann in the following manipulations: (1) The substance under examination is not spread out; (2) superheating is avoided; (3) the acetic acid by a properly regulated heating is allowed to penetrate the residue and to act upon the hemaglobin; (4) at a properly regulated temperature the acetic acid surrounding the residue is evaporated, while the acid with which the residue is moistened is not driven off.

TEST FOR UROBILIN, UROBILINOGEN AND BLOOD IN URINE.

For the detection of urobilin, urobilinogen, and blood in urine, Florence (*Journ. pharm. chim.*) recommends the following reagent: Pyridine, 10 grammes; alcohol, 10 grammes; chloroform, 10 grammes; zinc acetate, 1.3 grammes. Two to 3 c.c. (mils) of the urine are mixed with 4 to 6 c.c. (mils) of the reagent and shaken so as to avoid emulsification. After standing, the lower layer will remain colorless if both urobilin and urobilinogen are absent. When the former is present, a green fluorescence is produced at once, while in the presence of the latter the fluorescence is produced only gradually. Biliverdin turns the mixture greenish and after a short while renders the liquid fluorescent. The presence of blood is indicated when the mixture exhibits a pink or cherry-red color.

TEST FOR BLOOD IN URINE.

Fleig, (*L'union pharm.*) has found that fluorescein is a more sensitive reagent for the detection of blood in urine than Meyer's reagent (phenolphthalein), showing one part of blood in one million parts of urine. The reagent is prepared by dissolving 0.25 gramme of fluorescein in 100 c.c. (mils) of a 20 per cent. caustic potash solution, adding 10 grammes of finely powdered zinc and heating with constant shaking until the liquid is no longer fluorescent. The mixture is then filtered while still hot and preserved, preferably with the addition of a small quantity of zinc dust in yellow bottles protected from light. If 0.25 to 1 c.c. (mil) of this solution be mixed with 2 c.c. (mils) of urine and 3 drops of hydrogen dioxide solution added, a fluorescence occurs in the urine if blood be present, the intensity varying with the amount of the latter present.

VALUE OF MEYER'S REAGENT FOR THE DETECTION OF BLOOD IN URINE.

According to Labat (*Bull. soc. pharm. Bordeaux* through *Rép. de pharm.*) the value of Meyer's reagent (see the CIRCULAR for July, 1910, page 358) for the detection of blood must be seriously questioned. Several substances, such as ferric chloride and copper sulphate, although very rarely present in urine, give similar reactions, which, however, are not given, when the urine is boiled. Labat bases his objection on the results of the examination of 124 samples of urine, in each of which the presence of blood could be proven microscopically by the presence of hemine crystals. Eighty-four of these samples did not give a coloration with Meyer's reagent and in only 40 was the reaction positive; in 13 of the latter the blood was visible to the naked eye, or by the aid of the spectroscope. To make the reaction more sensitive Telmon and Sardou have recommended to dilute the urine with acetic ether, by which substances which might retard the reaction are eliminated. Labat admits that the sensitiveness of the reaction is considerably increased, but he has found that by this modification a positive reaction is obtained at times with normal urine free from blood. This view is also taken by Fleig. The author therefore recommends to examine the urine for blood with the aid of a spectroscope or preferably a microscope. In case these instruments are not available the test may be made with Meyer's reagent, using the modification originated by Fleig, i.e., boiling the urine and diluting it with one volume or one and a half volumes of a normal urine with a higher specific gravity. If a distinctly red color is obtained the urine may be pronounced as containing blood.

URINES WITH A BLOOD-LIKE APPEARANCE.

Very often urines are met with, which although not containing red blood corpuscles, give when viewed through a spectroscope two absorption bands, which on superficial observation may be taken for those produced by oxyhemaglobin. By a more careful examination, however, according to Déniges (*Bull. soc. pharm. Bordeaux*, through *Rép. de pharm.*) it will be found that the two bands are more separated from each other than the two produced by the presence of blood. On acidifying the urine the red color disappears, and the one band in the yellow of the spectrum, can also no longer be seen. Urines, which possess a red color, are invariably alkaline, the alkalinity being produced either by the administration of alkaline salts to the patient, or by the urine having undergone a partial fermentation. To prove the presence of blood the benzidin test should be made.

TESTING BENZIDIN FOR USE IN THE BLOOD TEST.

Schumm (*Merck's Ann. Report*) says that commercial benzidin is not always suitable for applying the blood test. The following method of testing the substance is suggested: A saturated solution of benzidin in alcohol is rendered acid with acetic acid, or a saturated solution of benzidin in glacial acetic acid, is mixed with an equal quantity of hydrogen dioxide solution, and a few c.c. of water are added. No coloration, or, at any rate, only a slight coloration, ought to occur within a few minutes.

TEST FOR CRYOGENIN IN THE URINE.

Déniges (*Bull. soc. pharm. Bordeaux*) recommends the following method for detecting cryogenin in

urine, no matter whether acid or alkaline. Ten c.c. (mils) of urine are mixed with 2 or 3 grammes of lead or manganese peroxide, the mixture made alkaline with caustic soda and filtered. In the presence of cryogenin the filtrate will exhibit a more or less deep orange color. When further urine is mixed with an equal volume of acid mercuric sulphate solution a yellow color is produced, varying in intensity with the amount of cryogenin present. By replacing acid mercuric sulphate solution by a solution of mercuric acetate, in normal urines precipitates are produced which vary in color from white to yellowish white, while urines containing cryogenin yield orange-red precipitates.

TEST FOR ALBUMIN IN URINE.

Ogneo (*Apoth. Zeit.* through *Chemist and Druggist*) gives the following new method for the detection of albumin in urine. Five to six c.c. (mils) of urine are acidified with acetic acid, and 1 c.c. (mil) of tincture of iodine added. The whole is well shaken. A brownish precipitate results. Solution of sodium bisulphite is then added to decolorize the iodine solution. If a precipitate is then present, the urine contains albumin; but if albumin be absent, the liquid remains quite clear.

SIMPLE TEST FOR SUGAR IN URINE.

Hasselbalch and Lindhard (*Hospitalstidende* through *Journ. Am. Med. Asso.*) describe a new test for determining without laboratory facilities whether an applicant for life insurance, for instance, has pathologic proportions of sugar in the urine. Their technique dispenses with the necessity for removing the albumin beforehand, and the error from the "autoreduction" of the urine is less, they assert, than with any other of the usual methods, the alkaline solution of safranin used not being reduced by uric acid or creatinin. The findings with this and the ordinary tests in long series of normal and glycosuric persons are tabulated for comparison, all apparently confirming the reliability of the test and the keeping properties of the reagent. This is a 1 in 10,000 solution of safranin; it does not seem to be affected by alkalies or heat, but the tint changes on the addition of sugar, the deep red tint fading away and the colorless fluid then assuming a yellow or pinkish-yellow tint or fluorescence. One c.c. (mil.) of the 1 in 10,000 safranin solution and 1 c.c. (mil.) of a 1 per cent. solution of potassium hydrate are mixed and the urine added drop by drop, after which the glass is placed in the boiling water bath for three minutes. The above mixture of 1 c.c. (mil.) of each fluid reduces about 0.25 mgm. of grape sugar, from which it is easy to compute the approximate sugar proportion in the urine. The test may be regarded as giving negative findings if the characteristic change of tint does not follow when ten drops of urine are added to a mixture of 3 c.c. (mils.) each of the safranin and the potassium hydrate solutions and the whole is heated in the boiling-water bath for three minutes. Certain other sugars give the reaction as well as grape sugar.

IDENTIFICATION OF LACTOSE IN URINE.

Lactose can be easily detected in urine by converting the sugar into its osazone, a process which may be carried out according to Labat (*Bull. soc. pharm. Bordeaux*, through *Rép. de pharm.*) in the following way: 100 c.c. (mils.) of urine are made slightly alkaline with ammonia and evaporated on a water-bath to

about 10 c.c. (mils.). The mixture is then filtered, the filtrate clarified by the addition of lead subacetate solution and filtered again. To this filtrate an equal volume of the following solution is added: phenylhydrazin one part, glacial acetic acid three parts, sodium acetate two parts, and water twenty parts. After allowing to stand for about an hour, the mixture is cooled. If the urine contains only glucose it is frequently necessary to concentrate the solution in order to obtain the characteristic crystals of glucosazone. If, however, lactose is present, the crystals of lactosazone can easily be seen through the microscope.

DETERMINATION OF SACCHAROSE IN THE PRESENCE OF REDUCING SUGARS.

For the determination of saccharose in the presence of reducing sugars, Lemeland (*Journ. pharm. chim.*) recommends the following process. A convenient quantity of the mixture of the sugars is transferred to a graduated flask of 100 c.c. (mils) contents, mixed with 0.5 gramme of manganese peroxide and heated in a boiling water bath. When the mixture has acquired the temperature of the bath, hydrogen dioxide and caustic potash are added, 30 c.c. (mils) of the former and 2 c.c. (mils) of the latter for each gramme of the reducing sugars. The heating is continued for 35 to 45 minutes, after which time the reducing sugars will have been destroyed. After cooling, the mixture is neutralized exactly with nitric acid, decolorized with animal charcoal or lead acetate, the volume made up with water to measure 100 c.c. (mils) and the solution, after filtering, polarized in the usual way.

FEHLING'S TEST AND FORMALDEHYDE IN URINE ANALYSIS.

Robertson calls attention in the *Prescriber* to the fact that the addition of formaldehyde to urine as a preservative interferes with the Fehling test for sugar by itself causing a precipitate of cuprous oxide independent of the presence of sugar.

TEST FOR BILE PIGMENTS IN URINE.

Stenza (*Nedrl. Tijds. Geneesk.* through *Rép. de pharm.*) recommends the following methods for the detection of bile pigments in urine; 10 c.c. (mils) of the urine under examination are mixed with 20 drops of a 20 per cent. aqueous solution of sodium carbonate and 20 drops of an aqueous solution of calcium chloride of the same strength. If the precipitate formed is white, bile pigments are absent; if yellow, it is filtered off and dissolved in 3 c.c. (mils) of a mixture of 95 c.c. (mils) of alcohol and 5 c.c. (mils) of concentrated sulphuric acid. A yellow solution will be obtained which on addition of one drop of a 0.5 per cent. aqueous solution of sodium nitrite will assume a green color, when bile pigments are present. Urines rich in urobilin produce with calcium carbonate a pink precipitate.

NEW TEST FOR URIC ACID.

When an aqueous solution of an alkali salt of uric acid is mixed with an aqueous solution of zinc sulphate, the white gelatinous precipitate of basic zinc urate will soon acquire a greenish color turning to blue. This reaction is due to oxidation by the air, according to Ganassini (*Rev. pharm. de Flandres* through *Nouv. rem.*). The presence of albumin does not interfere with this reaction, which according to the author can be used with advantage for the detection of uric acid in blood also.

Abstracts

Unreliability of Tablets of Bismuth, Opium and Phenol.

Puckner and Hilpert (*Journ. Am. Med. Asso.*) supplement a report made several years ago in which the unreliability of tablets of bismuth, opium and phenol was pointed out. They found at that time that these tablets sold by different firms contained amounts of phenol ranging from 76.65 per cent. down to 12.66 per cent. of the amount claimed. Wide publicity having been given to this report, experiments were recently made to determine whether the firms whose products had been before examined had made any improvement. The result shows that while the product of some manufacturers has been improved somewhat, that of others is worse than before. One firm whose product contains only two-thirds of the amount of phenol claimed now places on the label the following legend: "The amount of phenol in this tablet, on account of its volatile nature, is approximate." In an editorial note, the *Journal* says, that while the findings are not creditable, it is not willing to charge dishonesty or incompetency of reputable manufacturers. It is inclined to think that they have little respect for physicians using such complex mixtures, and therefore think that care as to scientific accuracy is needless.

Estimation of Formaldehyde.

The following simple method for the estimation of formaldehyde has been recommended by Herrmann (*Chem. Zeit.*) About 4 to 4.5 grammes (exactly weighed) of the formaldehyde solution under examination are transferred to a glass-stoppered 150 to 200 c.c. (mils) flask, 3 grammes of powdered ammonium chloride are added and then 25 c.c. (mils) of double normal caustic soda solution. The flask is then closed well and allowed to stand until the mixture has assumed ordinary temperature. After the addition of 50 c.c. (mils) of water and 4 drops of a one per cent. methyl orange solution the excess of the alkali is titrated with normal sulphuric acid. By multiplying the number of c.c. (mils) of caustic soda, used for the formation of hexamethylenetetramine, by 0.12, the amount of formaldehyde in grammes is obtained. In the case of technical formaldehyde, which usually contains acid, the latter should previously be exactly neutralized.

Blindness from Santonin.

Children under two years of age should never be given santonin. Even when given to older children this vermifuge is liable to produce serious complications, especially when given with castor oil, which increases its solubility. Baxter (*La sém. méd.* through *L'Union pharm.*) reports a case of blindness produced by the administration of santonin to a five year old girl. As the patient vomited out the first dose of one-half grain in castor oil, a second dose of one-half grain in 8 grammes of the oil was given; no noticeable effect was produced until about eight hours, when a large number of worms were discharged. The child became very feeble during the next two days and on the third day it was found that she had become totally blind. She has never recovered her eye-sight.

Formaldehyde in Alcohol.

For the identification of formaldehyde in alcohol Lindet (*Zeit. anal. Chem.*) has found the following method very convenient. A small amount of dry casein is mixed with 10 c.c. (mils) of the alcohol under examination, followed by a few drops of diluted ferric chloride solution, 10 c.c. (mils) of syrupy phosphoric acid and 10 to 15 c.c. (mils) of sulphuric acid. In the presence of formaldehyde a violet color is produced. By this method one part of formaldehyde can be detected in 300,000 parts of alcohol. Butylaldehyde and valerylaldehyde give a similar color. When formaldehyde is present to any large extent, a black color is produced, and in such a case the alcohol should be properly diluted before being subjected to the test. In the absence of formaldehyde only a brown color is produced.

Necessity of "First Aid" Instruction.

Johnson (*Journ. Am. Med. Asso.*) reports the case of a boy accidentally shot through the knee by a younger brother who lost his life through lack of immediate aid. The bullet entered his knee-joint from the anterior side, just internal to the patella, and passed completely through the joint, severing the popliteal artery. The author arrived about ten minutes after the accident had occurred, but the loss of blood had been so great that the patient lived but a few minutes, never having regained consciousness. This, says the author, emphasizes the necessity of instruction in the public schools regarding "first aid to the injured."

Constituents of Fagara Xanthoxyloides.

The bark of the root of fagara xanthoxyloides contains according to Thoms (*Pharm. Zeit.*) a dark-colored very poisonous oil, from which, after prolonged standing, a crystalline substance separates which has been named fagarol. This body, which melts at 127-128°C., and possesses the formula $C_{20}H_{19}O_6$, seems to be nearly related to cubebin. From the peel of the seeds 2.4 per cent. of a volatile oil was obtained from which a crystalline substance could be separated; the latter, which is a strong fish poison, has been named xanthotoxin. It melts at 144-145°C. and has the empirical formula $C_{12}H_8O_4$.

Constituents of Coconut Oil.

Haller and Lassieus (*Compt. rend.* through *Chem. Drug.*) have isolated a small amount of odorous volatile substances from ordinary coconut fat. They find that this essence, which may be called an essential oil, contains methyl-heptyl-ketone, methyl-nonyl-ketone, and a small quantity of an optically active aldehyde. It closely resembles ordinary oil of rue (*ruta graveolens*) in its general characters.

Chocolate as a Cure for Morphine Habit.

It is reported in the *Confectioners' Journal* that the attending physician and the matron at the county hospital at Binghamton, N. Y., have found by experimentation that by gradually replacing morphine with unsweetened chocolate they were able in time completely to deprive morphine habitués of the narcotic. The transition period is said to be entirely free from sleeplessness and other disturbing symptoms.

New Test for Morphine.

The following test for morphine has been devised by Denigès (*Compt. rend.*). Ten c.c. (mils) of a solution of the alkaloid (containing not less than 0.003 per cent.) are transferred to a test-tube, mixed well with 1 c.c. (mil) of hydrogen dioxide solution and 1 c.c. (mil) of ammonia water and then with one drop of a 4 to 1 per cent. solution of crystallized copper sulphate. (The strength of the latter solution is according to the less or greater concentration of the morphine solution.) After shaking well again, a reddish color will be developed, varying in intensity with the amount of morphine present. The coloration is instantaneous when the solution contains at least 0.1 per cent. of morphine. This test can also be applied to solutions suspected to contain morphine, provided they are colorless or almost colorless, and for a quantitative estimation of the alkaloid in syrup of morphine. For the latter purpose 10 c.c. (mils) of the syrup are treated as outlined above and compared colorimetrically with a solution of morphine hydrochloride of known strength treated in the same manner. Residues obtained in toxicological analysis, which are suspected to contain morphine, are treated with a drop of hydrochloric acid, the solution evaporated to dryness, the residue dissolved in a small drop of hydrogen dioxide solution and then mixed with one drop of a solution prepared by mixing 1 c.c. (mil) of a 3 or 4 per cent. solution of copper sulphate with 5 c.c. (mils) of ammonia water and 5 c.c. (mils) of water. A red coloration of the liquid indicates the presence of morphine. This reaction is not given by codeine, thebaine, papaverine, narceine and narcotine. Positive, but different colorations, are obtained with direct derivatives of morphine, namely, oxymorphone, apomorphine, heroine, etc.

The Wasserman Reaction.

Kaplan (*Journ. Am. Med. Asso.*) from a study of over 3,200 Wasserman reactions concludes that the value of the test for diagnosis and therapy has been greatly overrated. He maintains that promiscuous use of this test by insufficiently instructed physicians is as dangerous as the use of reports from tyro sero-diagnosticians. He lays stress on this point because he has learned of its being the cause of serious damage.

Taxicatin a New Glucoside.

Lefevre (*Journ. pharm. chim.*) has succeeded in isolating a new glucoside from the twigs of *taxus baccata*, which he has called taxicatin. It possesses the formula $C_{13}H_{22}O_7$ and by hydrolysis with diluted sulphuric acid or emulsin it yields d-glucose and a non-crystallizable product with the formula $C_7H_{12}O_2$. In addition to the glucoside the author found the twigs to contain emulsin and invertin.

The Sputum in Typhoid Possibly Infectious.

Tenney in a paper presented at a meeting of the American Society of Tropical Medicine reported a study of the saliva and sputum in fifty-three cases of typhoid fever. He found that while the sputum does not frequently contain the typhoid bacillus, it does so occasionally, and on that account it cannot be ignored as a source of infection.

Poisoning by Epsom Salt.

Boos (*Journ. Am. Med. Asso.*) concludes that magnesium sulphate (Epsom salt) in bulk or in concentrated solution, is absorbed, in part at least, from the gastro-intestinal tract into the blood, and if a sufficient amount is absorbed at a time poisoning will result. Of ten cases he has collected, six resulted fatally. The slowness of its excretion renders its repeated dosage in concentrated solution risky on account of possibility of poisoning by cumulation. The symptoms of poisoning, as noted in the ten cases, are largely those of paralysis and irritation of the bowel, diminution of the urine, and, in the majority, a marked paralyzing effect on the respiration. It has also an effect on the reflex centers of the cord and on the sensibility as shown by Meltzer. The author questions Meltzer's recommendation of the subcutaneous use of magnesium sulphate, and says that it should be employed, if ever, only with the greatest care. In cases of suspected magnesium poisoning large quantities of normal salt solution should be given intravenously, and Meltzer's experiments suggest the possible value of the subcutaneous use of calcium salts in dilute solution.

Cactus Grandiflorus.

Hatcher and Bailey (*Journ. Am. Med. Asso.*) in view of conflicting testimony regarding the therapeutic activity of *cactus grandiflorus* conducted an extended series of experiments to determine the question. The authors say that there can be no doubt that much of the misunderstanding which exists in regard to this drug has arisen through the substitution of other substances for *cactus grandiflorus*. They consequently were careful to procure authentic specimens. They were unable to obtain any evidence that the true Mexican *cactus grandiflorus* possesses any pharmacologic action whatever, but on the contrary, it appears to be a singularly inert substance when administered either by the mouth or by the vein. When colossal doses of *cactus grandiflorus* are given by the vein they sometimes—but not always—appear to exert an extremely feeble action on the heart; but this action is so slight that its nature could not be determined.

Caution as to the Use of Iodine Internally.

Keehl (*Münch. med. Woch. through Med. Rec.*) urges that the thyroid always be examined before pushing iodine or iodides. He considers enlargement of the thyroids a contraindication to the use of the drug in arteriosclerosis. The patient should also be investigated as to the possible presence of thyrotoxic symptoms, which also contraindicate iodine. The author believes further that indiscriminate use of iodine causes both enlargement and hyperactivity of the gland. If iodine is given when thus contraindicated, the condition set up appears to resemble the so-called "iodine cachexia" as described by others.

Ideal Ointment Base.

Fordyce (*N. Y. Med. Journ.*) says that he has found an ideal ointment base in a mixture of wool-fat and ointment of rose water. The proportions of the ingredients may be varied to suit individual cases, but a mixture of 1 part of wool-fat to 3 parts of the cold cream was generally satisfactory.

The Modern Materia Medica.

Antipyreticum Rayman is said to consist of acetanilide, phenacetin, antipyrin, alcoholic extract of Ceylon cinnamon, syrup of orange peel and mucilage of acacia.

Bilifer-Gelodurat Stærke I, exploited as a cholagogue, is in the form of capsules said to contain lithium oleate, extract of belladonna, extract of nuxvomica, extract of rhubarb and a minute quantity of castor oil.

Bromon Robin, a French preparation exploited as a sedative, is a liquid said to contain "bromopeptonates."

Calcodat is a trade name for calcium peroxide.

Calmine is another name for the mono-sodium salt of veronal.

Cholera Serum is a mixture of horse and goat serums.

Cicatricine is said to consist of thiosinamin and antipyrine dissolved in water. It is used hypodermically.

Credargan is a form of colloidal silver.

Crepitin is an albuminoid from the milky juice of hura crepitans. It acts like abrin and ricin.

Erséol Prunier, exploited for the treatment of rheumatism, neuralgia, grippe, etc., is quinoline sulphasalicylate.

Ferronin is said to be a saccharated tincture of iron.

Glyco-Phénique Déclat is a 10 per cent. solution of carbolic acid in glycerin.

Haemofor is an aperient tincture of iron. It is also marketed in combination with arsenic.

Hérad's Serum is a solution of sodium chlorate, potassium chloride, sodium phosphate and sodium chloride in water.

Howell's Serum consists of sodium chloride, calcium chloride, potassium chloride and sodium bicarbonate dissolved in water.

Hypnoval, exploited as a hypnotic, is amido-chloral bromoisovalerate.

Iodolysin is a compound of thiosinamin and ethyl iodide, intended to promote absorption of fibrous tissue.

Laxanin-Abfuhrschokolade is an aromatized chocolate containing castor oil and phenolphthalein.

Lodua: Ngezi. One of the myrsinaceæ belonging to the family of embelia. The bruised fruit is recommended as a tapeworm remedy.

Magnodat is a trade name for magnesium peroxide.

Medinal is another name for the mono-sodium salt of veronal.

Modiscop is a preparation for hypodermic injection containing morphine, dionine and scopolamine.

Novocol is sodium monoguaiacolphosphate.

Nigrosot Pills are said to consist of creosote and charcoal. They dissolve in the intestines only.

Peroxan is the name for tablets containing among other ingredients calcium peroxide.

Phosphatine Falières is of French origin and is said to contain calcium diphosphate, flour, sugar and fat-free cocoa.

Pilules and Sirop de Chassaing contain pepsin and diastase.

Piutinol is a sulphur, pine oil, glycerin and alcohol mixture for preparing sulphur baths.

Poudre Laxative de Vichy (Dr. Sonligoux) is a mixture of senna leaves (previously extracted with alcohol), fennel seed, anise seed, etc.

Ricilan is aromatized castor oil.

Serum Jodatum is said to be an aqueous solution of sodium phosphate, sodium sulphate and sodium iodide.

Serum Leclarq is said to be a solution of sodium chloride, sodium phosphate and sodium sulphate in water.

Sirop d'Acid Phénique Déclat is a palatable syrup containing carbolic acid.

Huflederkitt (Hoof Putty).

According to the *Pharmaceutical Journal* the preparation known as huflederkitt used for filling cracks in the hoofs of horses is made after one of the following formulas:

I.

Guttapercha	2 parts.
Ammoniac	1 part.
Soot	a sufficient quantity.

Melt the first two ingredients together; stir in enough soot to color, and pour while warm into the cracks, which should have been well cleaned.

II.

Turpentine	3 parts.
Ammoniac	4 parts.
Guttapercha	4 parts.

Melt together at a gentle heat and apply as directed under the first formula.

Dry Shampoo.

This suggestion is found in a recent issue of *Physicians Drug News*:

Orris root.....	6 ounces.
Fuller's earth.....	7 ounces.
Arrowroot starch.....	½ ounce.
Oil of lavender.....	1 dram.
Alcohol	2 ounces.

Reduce the solids to a fine powder; mix this well and spread it out to a thickness of about two inches. On this, spray the oil dissolved in the alcohol, and, after several hours, pass the powder through a moderately fine sieve.

Bouquet Toilet Water.

Oil of bergamot.....	7 grammes.
Oil of citron peel.....	4 grammes.
Oil of sweet orange.....	3 grammes.
Oil of lavender flowers.....	5 grammes.
Oil of saigon cinnamon.....	15 drops.
Oil of neroli.....	15 drops.
Oil of cloves.....	15 drops.
Alcohol (90%).....	900 grammes.
Distilled water.....	225 grammes.

Speaking about odd or striking firm names, how would this do, Alum & Cold, General Contractors?

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Beck's Bismuth Paste.—W. E. B., Maine.—We suppose that this is the preparation you have in mind when you speak of *bismuth vaseline paste*. This remedy, of which there are two forms, is named after Dr. Emil T. Beck, of Chicago, and is used in the diagnosis and treatment of tuberculosis. For the paste used for diagnostic purposes and for the first few injections, the following is the formula:

Bismuth subnitrate..... 30 grammes.

Vaseline 60 grammes.

Mix while boiling.

For a paste for use in the treatment of cases of long standing, the formula is—

Bismuth subnitrate..... 30 grammes.

Wax 5 grammes.

Soft paraffin (120° melting point). 5 grammes.

Vaseline 60 grammes.

Mix while boiling.

In a note contributed to the CIRCULAR for December, 1909, page 633, by Dr. Beck, that authority says:

The vaseline (usually yellow vaseline is used) is first sterilized by the usual method of boiling and is then allowed to cool off. Thereupon the proper quantities of bismuth subnitrate and vaseline are weighed out and then are mixed well in a percolator until a smooth mass is obtained. It is, of course, understood that the bismuth subnitrate must be free from impurities such as arsenic or dust. Some of the preparations of bismuth subnitrate give off more nitric acid than others. (See an article published by Dr. W. S. Baer, *Johns Hopkins Bulletin*, October, No. 223). The preparation is then placed in enamel jars until such time as it may be needed.

When the preparation is to be used the enamel jar containing the same is placed in a water bath, the water being allowed to boil, and thus the preparation in the jar becomes liquefied, and as soon as it is sufficiently so, it may be drawn up into a syringe and is then ready for injection.

Care should be exercised to avoid the admixture of water during the course of preparing the paste. Mixing the bismuth subnitrate with the vaseline while the latter is boiled (our former method of preparation) is not satisfactory for the reason that the bismuth frequently oxidizes and causes the mixture to become black. We have never noticed any effervescence taking place when mixing the bismuth with the boiling vaseline, although that might possibly occur when the vaseline is too hot.

In the CIRCULAR for May, 1909, page 229, is a warning by Dr. Beck of the danger which may be caused by the formation of a nitrite and by the bismuth itself when this paste is employed.

Moth Powder.—J. H. A., Connecticut.—Camphor is one of the best-known moth repellants, and but for its high price would doubtless be the most popular one as well. Naphthalin is much cheaper, and so, notwithstanding its disagreeable odor and the fact that scientific men have said that its presence does not prevent the breeding of moths or the ravages of their larvæ, is largely used by the public to keep moths away, and seemingly with results that take it out of the class of hoodoo remedies. Frequently camphor and naphthalin are mixed, and volatile oils with

strong and pleasant odors, or cedar wood chips, added, to make a moth powder. Tobacco dust is used for the same purpose, either alone or in connection with some of the other things mentioned.

A few formulas from previous issues of the CIRCULAR and elsewhere, follow:

I.

Lupulin 1 ounce.

Powdered camphor..... 8 ounces.

Powdered black pepper..... 8 ounces.

Tobacco dust (snuff)..... 1 pound.

Cedar-wood sawdust..... 2 pounds.

II.

Powdered capsicum..... 4 ounces.

Powdered naphthalin..... 1 pound.

Insect powder..... 1 pound.

III.

Powdered camphor..... 5 ounces.

Powdered naphthalin..... 1 pound.

Cumarin 5 grains.

Oil of neroli..... 16 drops.

Oil of mirbane..... 16 drops.

The surest protection against moths is to pack the articles that may suffer from them in bags and so securely close them that the insect can find no entrance. Paper answers well as a packing material, but all joints should be *pasted*. Of course the packing should be done before the moth has had a chance to lay its eggs in the material.

The Meaning of "Mil."—L. H., Florida, and V. P., Virginia.—"Mil" is an abbreviation of "milliliter," commonly called "cubic centimeter" and written "c.c." We believe the shorter (but not uglier) word is of British origin, and its brevity gives it certain advantages over either the long single word or the combination of two words just quoted, while the fact that it is a word and neither merely initials nor yet two words makes it superior to "c.c." in some respects. We are doing what we can to introduce it to American readers by printing it in parentheses after the letters "c.c." wherever we use the latter. In course of time we hope we may feel justified in dropping the "c.c." and the parentheses and allowing the word "mil" or "mils" to stand alone.

See also notes on this subject in the issues of the CIRCULAR for July, page 365, and February, page 71, both for last year, and April, 1909, page 186.

To Decolorize Ammonia Water.—W. C. Lane, North Carolina, writes: "To decolorize ammonia water that has been colored by contact with metallic containers, use light calcined magnesia. A very small quantity is sufficient. Mix; shake; allow to stand a few minutes; then filter."

We thank Mr. Lane for his kindness and trust that the process he has given will be found of value by many of our readers.

Rat and Roach Paste.—J. H. A., Pennsylvania.—Several formulas for phosphorus rat and roach pastes appear in the issues of the CIRCULAR for November, page 577; October, page 517; and April, page 179, all for last year. A rather comprehensive note on roach foods appears in the issue for January, page 29, which, perhaps, you had not seen when you wrote.

Bed Bug Liquid.—H. S. C., Connecticut, wants a formula for a bed bug liquid that is non-inflammable, and not poisonous to human beings, and will leave no stain.

Carbon tetrachloride applied to bed bugs kills them, and it is non-inflammable. In the sense that corrosive mercuric chloride is poisonous to human beings, carbon tetrachloride is not poisonous, but almost anything is poisonous if misused or used to excess. The principal danger from carbon tetrachloride lies in the anesthetizing effect of its fumes, in which respect it resembles chloroform. The vapor is heavy and accumulates, so thorough ventilation should be provided where it is used. Applied to varnished or painted surfaces, the tetrachloride has a bad effect, but on clothes it acts about the same as benzin.

Elixir of Terpin Hydrate.—L. D. S., New York. —Elixir of terpin hydrate is an official preparation, as is this elixir in combination with codeine and with heroine, formulas for the three preparations being in the National Formulary. Under the federal food and drugs act a drug is deemed to be adulterated if sold under a name recognized in the National Formulary and yet differs from the official article in standard strength or purity. Under the pharmacy law of this State a little more latitude is allowed, as the preparation is deemed to be adulterated if "when sold under or by a name recognized in the Formulary the strength, quality or purity or percentage of the alkaloid or alkaloids or other potent ingredient or ingredients differ from the standard determined by the test or formula given." Druggists should be careful to see that their preparations are not only medicinally what they claim to be, but that they conform to the technical provisions of the law as well.

There have been many complaints about the official formulas for terpin hydrate preparations, and more than a few suggestions for their improvement. Some of the latter are cited here, and readers, bearing in mind the warning as to the law, may be able to make good use of them.

Prof. E. Fullerton Cook, acting for the Philadelphia branch of the American Pharmaceutical Association, collected a number of proposed changes for the text of the National Formulary, among them the following for an elixir of terpin hydrate:

Terpin hydrate.....	256 grains.
Spirit of bitter almond.....	20 minims.
Compound spirit of orange.....	30 minims.
Glycerin	320 minims.
Water	2 fl. ozs.
Spirit of wild cherry.....	4 fl. ozs.
Alcohol.....	enough to make 2 pints.

No directions for mixing were given.

At last year's meeting of the American Pharmaceutical Association F. W. A. Hain offered the following formula for a "stable solution or elixir of terpin hydrate, useful as a vehicle for codeine, heroine, etc., and compatible in many mixtures":

Terpin hydrate.....	30.0 grammes.
Hot glycerin.....	650.0 c.c. (mils).
Fluid extract of wild cherry.	62.5 c.c. (mils).
Alcohol	235.0 c.c. (mils).
Glycerin, enough to make...	1000.0 c.c. (mils).

Powder the terpin hydrate and dissolve it in the

hot glycerin; when partly cooled add the other ingredients.

Each 4 c.c. (mils) of this solution contains 0.12 gramme of terpin hydrate—about 2 grains to the dram, which is nearly double the quantity directed by the official formula. Of course the quantity could be decreased as desired, and the smaller the amount used the less likelihood of separation. Hain said that to meet climatic conditions he sometimes found it advisable to reduce the amount of terpin hydrate to 25 grammes, or 0.1 gramme in each 4 c.c. (mils).

Dr. E. H. Squibb, in the *Critic and Guide*, offers the following formula as an improvement on the official elixir:

Terpin hydrate.....	17.5 grammes.
Tincture of sweet orange peel.	10.0 c.c. (mils).
Solution of saccharin.....	1.0 c.c. (mil).
Alcohol	436.0 c.c. (mils).
Glycerin, enough to make....	1000.00 c.c. (mils).

It should be remembered that sugar sometimes separates from the syrup used in making the elixir, and possibly may be mistaken for crystals of terpin hydrate.

Creamy Clothes Cleaner.—R. F. S., Illinois, writes that some five or six years ago there was printed in the CIRCULAR a formula for a clothes cleaner containing, among other things, soap, ammonia, chloroform or ether, and benzin. He adds that the product was a white emulsion, and requests that we reprint the formula.

A hurried glance through the annual indexes for four years around the time mentioned by our querist reveals a dozen or more references to clothes cleaners, and a further search of the volumes shows two formulas, either of which might possibly be the one he seeks. They are reprinted herewith:

Electric Benzin.

From the CIRCULAR for May, 1906, page 164:

White castile soap.....	1 dram.
Alcohol	½ fl. oz.
Glycerin	1 fl. oz.
Ammonia water.....	1 fl. oz.
Ether	1 fl. oz.
Water.....	enough to make 16 fl. ozs.
Benzin	enough.

Dissolve the soap in the water, then add the remaining ingredients, except the benzin. Into a 4-ounce wide-mouthed bottle put 3 drams of the solution, and then add benzin, little by little, shaking well after each addition, until the bottle is full.

The author of this formula states that the finished product will be a thick white cream.

As benzin is very inflammable, the manufacture of this product should not be conducted in a room where there is any light fire, and caution should be given the purchaser regarding its use.

Chloroform Cleaner.

Castile soap.....	4 drams.
Chloroform	4 drams.
Ammonia water.....	1 ounce.
Alcohol	4 drams.
Water.....	enough to make 3 ounces.

Shake well and keep in a tightly stoppered bottle.

Quinine Hair Wash.—H. G. C., Pennsylvania.—See the note and formulas in last month's CIRCULAR, page 83.

Making Tablet Triturates.—Forrest H. Orr, acting for the Lyttle & Orr Company, Indiana, noting the request of "Ego" in the CIRCULAR for January, page 34, for some help from his brother pharmacists in the matter of tablet triturate making, writes:

We make our own tablet triturates of morphine and codeine sulphates in all the different sizes, and expect to make strychnine sulphate, heroine, and calomel and soda tablets in the various sizes.

We are using a hard rubber tablet triturate mold which makes fifty 1-grain tablets, and have had the best of success.

In making the morphine and codeine tablets we use a diluent or base composed of 5 parts of milk sugar and 1 part of cane sugar; and a liquid excipient composed of 5 parts of alcohol and 1 part of water; and find these proportions make excellent tablets of the right degree of hardness, which are as nearly perfect as any tablet could be, regardless of where purchased.

We usually make 1,000 tablets at a time, and after weighing out the proper quantity of active ingredient, milk sugar and cane sugar (the weight of the two last ingredients being determined anew for each different size of tablet), triturate them thoroughly and pass them through a fine sieve, then in a mortar moisten only a little more than enough of the powder at a time to fill the holes of the top plate of the mold, and when properly moistened rub into the holes with a horn spatula from both sides of the plate to insure perfect tablets, and press out with the lower (or peg) plate, and dry by placing in a warm place protected from dust over night or for about twenty-four hours.

It will take a little experience in moistening the powder, so as not to moisten too much or too little; as a rule, about $\frac{1}{2}$ dram is the proper amount for fifty tablets; when the powder will stick together when pressed between the fingers it is of about the right consistency. Some little pressure must be used in putting the powder into the mold in order to secure a firm tablet, the less pressure used the more friable the tablet; strong alcohol used as an excipient also makes a friable tablet, and the use of a weak alcoholic liquid results in hard tablets.

In making calomel and soda tablets greater care must be taken as they are more difficult to make, because calomel and sodium bicarbonate moistened with water and exposed to light become dark, and if the bicarbonate contains a trace of normal carbonate they will darken more readily; therefore a water-free excipient should be used, and if strong alcohol be used the tablets are apt to be too friable.

A thousand tablets can easily be made in an hour or hour and a half at a saving of about \$1.75 per 1,000, besides the satisfaction of practicing professional pharmacy.

The following are about the right proportions for 1,000 $\frac{1}{4}$ -grain morphine sulphate tablet triturates:

Morphine sulphate.....	250 grains.
Milk sugar.....	995 grains.
Cane sugar.....	199 grains.
Alcohol (80%).....	about 1 to 1 $\frac{1}{2}$ ounces.

I hope this may be of some service to the friend making the inquiry.

A "Brother Pharmacist," Pennsylvania, writes:

If Brother "Ego" is using a hard-rubber tablet triturate mold, which is usually marketed as a 1-grain mold, but which really holds 1 $\frac{1}{2}$ grains, and will use $\frac{1}{4}$ grain of powdered acacia to each tablet, he will have no trouble in dispensing a nice tablet. We keep on hand for this purpose 1 fluid ounce of alcohol to which 8 drops of water are added; and proceed as follows:

Atropine sulphate.....	1/10 grain.
Powdered acacia.....	6 grains.
Sugar of milk.....	30 grains.
Alcohol (as above.).....	enough.

Mix the ingredients thoroughly in a mortar; place the powder on an ointment slab, and add enough of the above alcohol to make a stiff paste, and work into the molds.

The exact quantity of alcohol cannot be given as it depends entirely on the temperature of the room. If "Ego" will do a little experimenting with the proportion of acacia and sugar of milk he will soon get the hang.

These correspondents show the kind of spirit that we are always pleased to see manifested by pharma-

cists, and for their communications we extend thanks not only on behalf of "Ego" and ourselves, but for our readers generally. The process outlined by Mr. Orr is quite similar to the one recommended by Prof. Charles Caspari, Jr., in his Treatise on Pharmacy, and, indeed, embodies the principles set forth in most works of this nature.

There is an article on this subject on page 124.

Guttæ Inosemzoff.—B. S. G., New York.—Dr. Fedor J. Inosemzoff (or Inosemzow) was professor of surgery in the University of Moscow from 1835 to 1859. He was also a director of a free polyclinic, editor of a Moscow medical gazette, and a much beloved physician whose name continues familiar in the mouths of the people as a designation for a celebrated stomach or cholera remedy. The formula for this mixture or "drops" is—

Vinous tincture of rhubarb.....	2 ounces.
Tincture of nux vomica.....	3 drams.
Tincture of peppermint.....	3 drams.
Hoffman's anodyne.....	3 drams.
Tincture of opium.....	4 drams.
Tincture of valerian.....	4 drams.
Tincture of Canadian castor.....	4 drams.
Extract of nux vomica.....	5 grains.
Oil of peppermint.....	10 drops.

This looks somewhat like a "shot-gun" formula, but it has survived many years, and seems to have done a little traveling from country to country, too.

Making Compound Elixir of Pepsin, N. F.—D. Archie Bullock, South Carolina, supplementing our reply to F. A. L., Florida (in the CIRCULAR for January, page 29), writes: "I beg to offer the following suggestion: Add your glycerin to the [otherwise] finished product and you have a pretty preparation that has been made very rapidly. We use a good deal of compound elixir of pepsin, and it usually takes about six days to filter it if we make it by the directions in the National Formulary, so we follow those directions except that we add the glycerin after filtration."

Practical notes on every-day pharmaceutical problems are always welcome, and we trust Mr. Bullock will let us hear from him again. It might be well to mention in passing, however, that under some of the State drugs acts changes of method of manufacture are mentioned in the same connection as changes of formula.

Non-Greasy Cold Cream.—F. J. G., Indiana.—In the CIRCULAR for January, 1910, there are over two pages of formulas for modern skin creams. One of these formulas follows:

Skimmed milk.....	1 gallon.
Tartaric acid.....	5 ounces.
Sodium benzoate.....	$\frac{1}{2}$ ounce.
Zinc oxide.....	1 ounce.
Glycerin.....	2 ounces.
Carmine solution.....	enough.
Perfume.....	enough.

Dissolve the acid in a pint of water and add to the warm milk. Strain and wash the coagulum. Rub the zinc oxide with the glycerin till perfectly smooth, and mix with the casein, adding lastly the perfume, color, and preservative.

Liquid Tooth Filling.—H. W., New York.—Doubtless the manufacturers alone could tell you the composition of the preparation to which you refer. The appended formulas repeated from a recent issue of the CIRCULAR represent preparations having a similar use. These preparations are called odontalgic balsams.

I.	
Sandarac	12 parts.
Mastic	5 parts.
Amber	1 part.
Ether	15 parts.

II.	
Mastic	23 parts.
Absolute alcohol.....	33 parts.
Tolu balsam.....	9 parts.

Dissolve the mastic in the alcohol; add the tolu and promote solution with the aid of a gentle heat, shaking occasionally.

Formulas for other temporary and anodyne fillings for teeth are to be found in last month's CIRCULAR, page 83; and in the issues for December and May, 1909, pages 532 and 236, respectively.

Formulas and Reason.—A. Weinstein, New York, favors us with some original observations on the subject of constructing formulas which will doubtless make interesting and helpful reading to many. He begins by quoting a couplet—

That which other folks can do
Why, with reason, may not you?

and then goes on to say:

It is a peculiar and sickly sensation that I sometimes experience when reading the "Notes and Queries" of THE DRUGGISTS CIRCULAR. If I were a son of the rich I should call it "brain storm," but ordinary mortal as I am, living on the sweat of my brow, I can describe it only as an excessive blood supply rushing and distressing my meager three pounds of cerebrum. In a feverish desire for relief the brain signals to my hand to grip the pen and jot down some thoughts to share with the editor who sits in the sanctum sanctorum of that department.

The cause of my mental disturbance is not a new one. It is as old as civilization itself. It is the old-time absurdity of relying upon the brains of other folks to do that which can be done by one's own with the use of reason and common sense. Let it be understood that my object is not to depreciate the useful and valuable information found in the "Notes and Queries," but to call attention to the amount of useful labor that would be spared its editor if the querists would only utilize their reasoning faculty and common sense, especially when seeking a substitute for a successful formula.

Roach Destroyers.

Let us take, for instance, the recent query for a "roach powder formula." I am sure that the one seeking the information has the required knowledge but lacks the habit of thinking how to make an application of it. If he did not he would reason something like this: The object sought is a food which roaches will like to eat, for if they do not like it they will not touch it. From observation in our own kitchen I know that they like flour better than any ordinary article of food; but as the purpose of feeding roaches is not to fatten them but to destroy them, I therefore should mix a poisonous substance with the flour of which they are so fond. Borax being little poisonous to human beings is preferable. Hence, we have, as a formula for an excellent simple and cheap roach powder—

Borax	77 parts.
Flour	33 parts.

Should we desire a liquid for the same purpose we must follow the same line of reasoning. We know that these insects are not fond of liquids, and to destroy them by the use of liquids we must apply one to them that will have a fatal effect. The anatomy of the roach, composed largely of fats, will dissolve in benzine, but this being

very inflammable and its vapors being explosive, it is dangerous to use, so a higher boiling hydrocarbon like kerosene, which is less unsafe for use, should be employed. Hence we have as an excellent and cheaper roach destroyer—

Kerosene	99 parts.
Aromatic oils.....	1 part.

Hair Tonics.

Let us take another recent query, a formula for a successful "hair tonic." Of course, I conscientiously believe that the treatment of any part of the human body should be left to the skillful physician, but as we are living in a practical world and "hair tonics" must be supplied, the preparation should at least be based on some knowledge, plus common sense. We must remember that the hair is not as simple as it looks. It has a shaft above the skin of which it is a modified form, and a root which is lodged in an involution of the epidermis called the hair follicle. The bulb on which the root rests is surrounded by fatty matter which is supplying it with material for its growth. Therefore any strong alkalies or fat solvents must not enter into the composition of a hair tonic, because when frequently applied and absorbed it will decompose the bulb of the follicle. On the contrary, it must contain oily or fatty matter, but as oil and fats are physically objectionable, we must turn to the by-product of oils and fats, glycerin, which has the advantage of being soluble in water. By adding to this a mild antiseptic like resorcinol, which will prevent decomposition of organic matter, and a mild astringent like witchhazel, in the following proportions—

Glycerin	40 parts.
Resorcinol	5 parts.
Hamamelis water.....	55 parts.

we have a simple harmless application for the hair.

Following this style of reasoning any good formula may be composed and if one has the coin to let people know and induce them to try his composition he may be sure to succeed, because, after all, it is the dollar more than the formula that brings the success.

Aqueous Liquids in Capsules.—J. Feldman, New York, seeing the inquiry in the CIRCULAR for last month, page 79, from a reader who wanted to know how best to dispense 5 minims of syrup of iron iodide and 1 minim of Donovan's solution in a capsule, writes: "I have come across that exact prescription many times, and after experimenting finally hit upon the following way to fill it, which has proved to be very good, the gelatin capsules remaining firm until the patient has taken them. Taking that prescription [calling for twenty-four such capsules] as an example, I'd mix about 3 drams of the syrup and 36 minims of the solution in a graduate (both being cheap enough to permit the waste of the extra quantity) and with a dropper place 6 drops of the mixture in a small capsule. This is the way I do it, and I experience no difficulty."

In advising our querist last month we expressed the opinion that the aqueous liquid would dissolve the capsules: as there are twenty-four of them to be taken we should fear to run the risk. But the proof of the pudding is in the eating, and it seems that Mr. Feldman has "got away with it"—not the pudding, but the trick of dispensing the aqueous liquids in gelatin capsules. As the properties of the mixture as well as of the capsules themselves, to say nothing of climatic conditions, are different in different stores, we should like to know what the experience of other druggists has been along this line.

Reciprocity Between Boards of Pharmacy.—W. A. T., Virginia.—A note in the CIRCULAR for January, page 31, answers your query as effectually as if it had been written for that purpose.

Refining Cotton Seed Oil.—G. B. C., Alabama.—This process, like all others carried on in an extensive manner by large interests, is subject to variations in the hands of different concerns, these variations, in the nature of improvements, generally being regarded as trade secrets. Given the general outline of the process, it is for each operator to work out the minutiae to meet the requirements of his own case.

In a general way it may be stated that when cotton seed oil is first pressed from the seed it is allowed to stand for a while, when a slimy precipitate deposits. The clearer portion is then drawn off and treated with a solution of sodium hydroxide of 1.06 to 1.09 specific gravity, and again allowed to stand. If the oil is clarified with fullers' earth and chilled to a temperature of about 50° F., its palmitin and stearin crystallizes and may be removed by pressing.

Just to what extent a retail druggist can compete with large cotton seed works in the matter of refining the oil is a matter for each to decide for himself, but we think it hardly probable that the small concern with such apparatus as is usually found or may easily be installed in a drug store, can do the work as economically as the larger ones.

Solution of Hydrogen Dioxide with "Alkaline Antiseptic."—J. A. B., New Jersey.—Forty-eight hours after it had been compounded, a mixture of equal parts of solution of hydrogen dioxide and alkaline antiseptic solution made by us was practically colorless. The result was the same with a solution of hydrogen dioxide containing acetanilide and with one which was stated not to contain the preservative.

There are, however, "alkaline antiseptics" colored by digesting cudbear in the solution. It may be that with these the decolorization process would proceed more slowly; it is a fact that the color of solutions made in this manner is naturally more permanent. The color of the proprietary preparation supposedly similar to "alkaline antiseptic" we found was not so rapidly discharged by the solution of hydrogen dioxide.

Why solution of hydrogen dioxide should be prescribed in an alkaline mixture is a mystery to us; no, perhaps it is not such a great mystery after all, but is the simple, logical result of the limited knowledge of incompatibilities possessed by the average physician.

Creo-Terpin.—T. A. C., Massachusetts.—Our knowledge of the composition and compounding of this preparation is limited to an acquaintance with the statement made on the label that each ounce contains—

Alcohol	25 per cent.
Heroine hydrochloride.....	⅓ grain.
Creosote	4 minims.
Terpin hydrate.....	4 grains.
Calcium glycerophosphate.....	4 grains.
Sodium glycerophosphate.....	4 grains.

There do not appear to us to be any insurmountable pharmaceutical difficulties in making a presentable solution of the given medicaments in a medium containing the stated proportion of alcohol and, say, 40 per cent. of glycerin. Such mixtures, however, are intended for dispensing as physicians' prescriptions.

Shaving Cream.—A. P., New York, has tried some of the formulas for shaving creams that have recently appeared in the CIRCULAR, and does not like them. Whether the fault lies in the formulas, or whether our querist did not use the right grade of material or the proper manipulation, we can not say and do not propose to discuss: he wants other formulas, and as it is our constant endeavor to please, we have gone to sources outside of the CIRCULAR for those we present below, and hope that one of them, or a variation of it to be suggested by experience after manipulation, will prove satisfactory. In the meantime we hold ourselves in readiness to assist further any of our readers who are unable to get satisfactory results by the use of these or any other formulas which we may publish:

This, from Pharmaceutical Formulas, is for a lanolinated shaving cream:

Lanolin	½ ounce.
Almond cream.....	10 ounces.
Rose water.....	4 ounces.
Coumarin	2 grains.
Oil of ylang-ylang.....	10 minims.

Put the lanolin in a warm mortar and mix the almond cream with it, occasionally adding some rose water. When thoroughly mixed, add the perfumes, and triturate off and on for several hours, so as to get a nice appearance.

By almond cream is meant a preparation to be found on the market, sometimes spoken of as Naples soap.

According to the *National Druggist*, the following process for the manufacture of shaving creams was published in the *Seifensiederzeitung* some time ago:

As raw materials in the production of this class of toilet articles are used lard, olive or sesame oil, and Cochin coconut oil. Before proceeding with the manufacture one must be sure that the fats and oils are perfectly fresh and clean. If this is not the case they must undergo a process of refining. This consists in carefully boiling the substance in clean kettles, together with water, to which some cooking salt has been added. The fats thus purified are strained, and are ready for immediate use. A good formula is as follows:

Lard	20 parts.
Olive (or sesame) oil.....	16 parts.
Cochin coconut oil.....	14 parts.

Stir together at a temperature of 35°C. (95°F.) and add, in a thin stream, 25 parts of caustic potash lye of 40°B. and 3 parts of a potash solution of 150°B., with constant stirring. Maintain the agitation until the mixture saponifies and becomes thick and tenacious. As a perfume, use for every 25 kilograms of fats the following:

Lavender oil.....	100 grammes.
Lemon oil.....	50 grammes.
Spike oil.....	50 grammes.
Thyme oil.....	50 grammes.

These oils are stirred in at the last. For containers use little porcelain jars. Keep the preparation in a cool place.

In looking for formulas for use in answering similar questions, some of the pharmaceutical journals, respectively, have found formulas which are produced herewith:

I.

From *Merck's Report*:

Curd soap.....	8 ounces.
Expressed oil of almond.....	2 ounces.
Glycerin	1 ounce.
Spermaceti	1/2 ounce.
Potassium carbonate.....	1/4 ounce.
Water	1 pint.

Cut the soap into shreds, and dissolve it by the aid of a water-bath in 14 ounces of water. Dissolve the spermaceti in the almond oil, and while warm mix it with the glycerin, potassium carbonate, and remainder of the water. Transfer to a warm mortar, gradually incorporate the warm soap solution, and continue the stirring until a smooth paste is obtained. With this incorporate any suitable perfume.

II.

From the *Western Druggist*:

Lard	14 ounces.
Potassium hydroxide.....	2 ounces.
Water	6 ounces.
Perfume	to suit.

Melt the lard in a porcelain vessel over a salt water bath; dissolve the potassium hydroxide in the water, and run the lye, thus formed, very slowly into the melted grease, stirring thoroughly all the time until saponification is complete.

A pearly appearance can be given to the "cream," which is simply a soft soap, by long trituration in a mortar with a little alcohol, say 2 drams to each pound of the soap.

Bitter almond oil may be used as a perfume for the "cream." Only a very minute proportion is required. A few drops dissolved in the alcohol used as above will suffice.

III.

From the *American Druggist*:

Hard paraffin (m.-p. 55° C.).....	22 parts.
Prepared suet.....	3 parts.
Soft soap.....	2 parts.
Boiling water.....	68 parts.

Place these materials in a vessel surrounded by boiling water, and when the fats are melted beat them together until a smooth, white emulsion is obtained. Continue the beating, maintaining the temperature above 70° C., and shake in gradually—

Tragacanth, in powder..... 2 parts.

When the mixture is homogeneous allow it to cool by removing the boiling water, and when nearly cold add

Glycerin	2 parts.
Oil of lavender.....	1 part.

The parts are taken by weight.

IV.

This formula, from the *Pharmaceutical Era*, is for a non-lathering shaving cream:

Cacao butter.....	1/2 ounce.
Almond oil.....	1/2 ounce.
Glycerin	1 ounce.
Primrose soap [?].	1/2 ounce.
Otto of rose.....	4 minims.
Oil of neroli.....	4 minims.
Oil of bitter almond.....	5 minims.
Distilled water.....	enough.

Melt the cacao butter and almond oil and pour into

a warm mortar containing the soap previously rubbed down with 3 ounces of boiling water; stir briskly to make a uniform cream, slowly adding 4 ounces of warm water previously mixed with the glycerin; finally add the perfumes.

With 4 ounces of rose water and no glycerin, this gives a cream suitable for potting.

V.

From the *Practical Druggist*:

Castile soap	1 ounce.
Water	4 ounces.
Oil of almonds.....	1/2 ounce.
Cacao butter.....	1/2 ounce.
Tincture of benzoin.....	1 dram.
Oil of bitter almond.....	5 drops.
Oil of rose geranium.....	5 drops.
Glycerin.....	enough to form a paste.

Digest the soap and water in a water bath, add to them the oil of almonds and the cacao butter, previously melted, and while the mixture is still warm, incorporate with it the other ingredients.

Directions on a Malt Prescription.—L. B., Québec, received a prescription for a dozen bottles of a proprietary malt extract, the directions on which were "1/3 bottle at each meal," and is in doubt as to whether so to label each bottle, or simply to place the directions on the case containing the dozen bottles. He seeks advice.

The function of directions is to direct, to the end that the one directed may proceed aright. If this end is accomplished by labeling the case, well and good; if not, then each bottle should be labeled. The dispenser is in a better position than we are to decide this question as it may arise in each case, but as a rule we should say that one label would suffice for the whole dozen.

It may be, however, that a question of excise is involved, in which case we advise an excess rather than a deficiency of caution.

To Prevent "Misting" of Eye-Glasses.—W. H., New York.—We have been unable to get any information regarding the preparation you name; and we suspect that you have not given the name right. For the purpose you have in view we should suggest the following mixture:

Potassium oleate.....	2 ounces.
Glycerin	1 ounce.
Oil of spike lavender.....	1 dram.

Beat the oleate into a paste with the glycerin, and incorporate the oil.

If sodium oleate be used a stiffer product results. A less satisfactory preparation is made by incorporating a little glycerin in some of the popular transparent glycerin toilet soaps.

Peterman's Discovery.—T. M., New Hampshire.—We have no knowledge of the composition of this bug killer, but we opine that kerosene having a specific gravity of between 0.800 and 0.810, perfumed with a little oil of sassafras, will approximate the physical characteristics of the preparation—and kerosene, sometimes colored with alkanet, is a bug killer of long-standing renown.

Making Bay Rum.—J. Feldman, New York, acting on our suggestion that those who tried Mr. Scott's formula for bay rum (in the CIRCULAR for last month, page 82) report results to us, writes:

I made up a small quantity of bay rum according to the formula of Mr. Scott. The finished product is very nice in appearance and odor, and looks very much like the distilled kind, but has a different feeling and after effect on the face. I also tried some on my hair, with good effect.

I have always made my bay rum according to the directions in the Pharmacopœia of 1870, and added a few drops of ammonia water to the unfiltered product, and I get a nice yellowish-green product, and with a neat green-and-gold label it sells fine.

We thank Mr. Feldman and should be glad to hear from him again, and from others on this or any other topic of interest to pharmacy.

Paste Shoe Dressing.—W. H. G., Massachusetts.—Perhaps the following formula will aid you in making the kind of dressing you wish:

Soap	12 parts.
Potassium carbonate.....	6 parts.
Beeswax	50 parts.
Water	200 parts.
Bone-black	100 parts.
Powdered sugar.....	15 parts.
Powdered acacia.....	6 parts.

Mix the soap, potassium carbonate, wax and water, and boil together until a smooth paste is obtained; then add the other ingredients, mix thoroughly, remove from the source of heat, and while hot pour into boxes.

Pills of Creosote and Balsam of Tolu.—José Schwarz, New York, referring to the discussion on the making of these pills, which took place at a recent meeting of the Brooklyn Pharmaceutical Association and was reported in the CIRCULAR for last month, pages 111 and 112, writes:

Just mix equal parts of distilled water and creosote and add powdered balsam of tolu, and see what a fine pill mass you can obtain without the addition of beeswax or any other substance. It is worth trying.

We thank Mr. Schwarz for his note and hope he will continue to bear us in mind whenever he has anything of interest to pharmacy to communicate. We are always glad to hear from our readers..

Lime Water.—Howard G. Snyder, Pennsylvania, commenting on the lime water note in the CIRCULAR for January, page 22, writes that in the store in which he works no lime water is dispensed that is not of the official strength. When first made the lime water is filtered into pint bottles, which sell for 10 cents each, with a rebate of 5 cents for the empty bottle. He says that it should not be dispensed in a larger quantity than 1 pint.

We are always pleased to receive notes of this kind from our readers and hope that many of them will follow Mr. Snyder's example and send us practical points for publication.

Fluid For Coloring Flowers Green.—H. E. D., New Hampshire.—When you wrote, the February number of the CIRCULAR probably had not reached you; a note on this subject appears on page 85 thereof.

Pilocarpine as a Hair Tonic.—H. N. B., New York, writes: "Is the expensive and largely prescribed alkaloid pilocarpine of the slightest value as an ingredient of 'hair tonics'? It is neither a capillary irritant, like cantharides, nor an antiseptic, like resorcinol or beta-naphthol. Does its cost act as a mental (and cranial) stimulant?"

This brings up an old subject which has been touched upon at greater or less length in the CIRCULAR at intervals for many years. In the issue for August, 1879, page 141, is a note in which it is stated that Dr. Schmitz, in a Berlin Medical journal, had said that in two instances he had observed the reproduction of hair on the heads of bald patients to whom he had administered "muriate of pilocarpia" for diseases of the eyes. One patient was a man of sixty years, to whom three hypodermic injections of the salt had been administered in fourteen days, at the end of which time, the head of the patient, which had been entirely bald, was noticed to be covered with a thick down which grew into an abundant crop of hair. In the other case the patient, aged thirty-two, had a bald spot as large as an ordinary playing card. Two injections of pilocarpine for eye trouble left this spot well covered with hair.

In the CIRCULAR for March, 1881, page 39, is a short review of the then recent literature of pilocarpine, in which Prof. Pick, of Prague, is quoted as having observed the remarkable effect of the drug on the hair. We quote: "It hastens recovery of alopecia areata, and acts even more favorably on seborrhea; indeed, in most cases he says that continued use of pilocarpine exerted an important influence on the oiliness of the hair and on its growth. The skin becomes softer, more pliant and satiny; comedones and papules of lichen planus can be more easily pressed out or got rid of, the scurfiness of the scalp becomes less or disappears, the hair is less brittle, the new growth of lanugo hairs changes more rapidly into dense, properly pigmented ones. Under employment of the drug for months the general condition of the patient was not impaired; indeed, the appetite improved, and he was better nourished." This remarkable testimonial had been published in *Vierteiljahrsschrift für Dermatologie*, i, 1880. It reads as if the professor who wrote it had been intoxicated by the exuberance of his own enthusiasm.

This enthusiasm seems to have been of an infectious nature, as in an answer to a query in the CIRCULAR for October, 1883, page 153, we read: "At the same time, after a number of doses [of pilocarpine] he will have the satisfaction to see his hair growing thicker and darker; and if he perseveres long enough, should nothing happen, he may succeed in obtaining a good head of black hair. In some cases the eyes also turn dark."

In the CIRCULAR for April, 1884, page 57, is a note clipped from the *Buffalo Medical Journal* to the effect that Dr. Pohlman had found that pilocarpine darkened hair in the presence of pigmentary matter, but not when such matter was absent.

More conservative in tone is a note in the CIRCULAR for March, 1892, page 62, in which pharmacists are warned that experiments with so potent a drug as pilocarpine should be left in the hands of physicians. An even more conservative statement appears in the issue for November, 1894, in answer to a querist.

We believe the latest reference to the subject in the

CIRCULAR appears in the issue for September, 1904, page 208, but in the Standard Dispensatory, issued in 1909, the therapeutic editor of which is Dr. Hobart A. Hare, professor of therapeutics and materia medica in the Jefferson Medical College of Philadelphia, we read under "Pilocarpine": "This drug also acts as a powerful stimulant to the growth of the hair, whether it be applied to the scalp or taken internally, and the new growth is often very dark in hue."

Dr. Torald Sollman, in his Text-Book on Pharmacology (1906), commenting on the increased action of the sweat glands caused by pilocarpine, says that this action "brings with it an increased circulation in the skin, and this secondarily increases the growth of the hair, and, it is claimed, also turns it to a darker color."

Notwithstanding all this testimony, however, we are of the opinion that one author has copied from another, or that all have copied from the same reports of a few isolated cases in which the value of the pilocarpine was not fully established; for, if it were so easy for men and women who are bald and gray, to grow a full suit of dark hair, why do we see thousands of them around us supporting hundreds of "hair tonic" fakers when they are so able to employ a physician to give them a few hypodermic injections of the drug that would do the trick, and would be so willing if the doctor would only encourage them?

We repeat a former warning, that pilocarpine is a dangerous drug, and experiments with its use should be confined to medical men thoroughly qualified to make them.

Father John's Medicine.—John W. Bachelder, New York, seeing the note in the CIRCULAR for last month, page 85, writes: "Father John's medicine is a preparation similar to Dr. Heinman's prescription, which he used to write many years ago in Boston, Mass. I do not remember the exact prescription, but it called for cod liver oil, powdered extract of licorice, confection of almond, essence of peppermint, and compound spirit of lavender. I think most of the old druggists in Boston have the prescription on file."

We thank Mr. Bachelder for his note, and hope he will let us hear from him again. It looks as if he "put it up to" those old Boston druggists, and we look for some of them to "rise to the occasion."

To Render Kerosene Uninflammable.—E. C. W., New York.—Carbon tetrachloride added to kerosene renders it less combustible, and the greater the proportion of the former the less easily the combination will burn. A mixture of equal volumes of the two liquids is said to make a fluid that will not ignite at any temperature to which such a preparation would ordinarily be exposed.

Anonymous Queries.—"Constant Reader," New York.—Your attention is called to the standing notice at the head of this department in which it is stated that queries, to be answered by us, must be accompanied with the name and address of the writer. Not only do we keep that notice standing, but almost every month we print a note similar to this one, calling special attention to it; and now and then we give our reasons for having made such a rule.

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Albucol; where may it be obtained.—E. M. C., Missouri.

Orange Manna.—C. W., Colorado.

Mitchell's Magic Lotion.—F. G., California.

Woofster's Corn Remedy.—J. L. C., Massachusetts.

Caementium.—E. J. C., Michigan.

Booth's Mi-o-na.—E. J. C., Michigan.

Pazo Ointment.—E. J. C., Michigan.

Ferruginous Cod Liver Oil.

The use of iron soaps in combination with cod liver oil has been widely suggested in Europe as a means of exhibiting iron and an easily digested fat in one preparation. Feist and Auerhammer have offered the following formula for such a preparation:

Solution of ferric chloride.....	100 grammes.
Alcohol	30 grammes.
Ether	250 grammes.
Linseed oil.....	140 grammes.
Solution of potassium hydroxide (25%).....	107 grammes.
Cod liver oil... enough to make	1,000 grammes.
Distilled water.....	enough.
Dried sodium sulphate.....	enough.

Prepare a potash soap of the linseed oil, using the alcohol and a sufficient quantity of distilled water [similarly to the U. S. P. method for making soft soap]. Dissolve this soap in 1500 grammes of distilled water; to this add the solution of ferric chloride diluted with 500 grammes of distilled water. Set this mixture aside for an hour, collect the precipitate, and dissolve it in the ether. Shake this solution with some dried sodium sulphate, decant, distill off the ether, and dissolve the iron soap in the cod liver oil.

Phenolphthalein Laxative Syrup.

The following formula is offered by a correspondent of the *Journal of the American Medical Association*:

Phenolphthalein	128 grains.
Salicylic acid.....	10 grains.
Bitter cake chocolate.....	1 ounce.
Syrup of acacia... enough to make	1 pint.

Melt the chocolate and mix with the syrup; then add the acid and the phenolphthalein.

This mixture requires a "shake" label.

A French Corn Cure.

Salicylic acid.....	10 grammes.
Lactic acid.....	10 grammes.
Chloral hydrate.....	10 grammes.
Castor oil.....	1 gramme.
Venice turpentine.....	1 gramme.
Extract of cannabis indica.....	2 grammes.
Collodion	100 grammes.

Nail Tinter.

Powdered stannic acid.....	20.0 grammes.
Sandarac resin.....	1.0 grammes.
Kaolin	4.0 grammes.
Carmine	0.2 gramme.
Extract of violet.....	5 drops.
Extract of ylang-ylang.....	10 drops.

Some Questions in Drug Store Mathematics.

Here are a few questions which may interest the drug clerk who wants to keep his knowledge of arithmetic bright until such time as he is ready to "go before the board." We should be glad to receive answers to these questions, and also to have clerks contribute questions for use under this head.

1. If a druggist pays \$110,000 a year rent for his store (as it is reported that one is to do in this city); employs 30 clerks at an average wage of \$15.75 a week; and his average gross profit amounts to one-third of his sales; how much must each clerk's average daily sales be to make the profit on the business equal the two items mentioned, taking no account of other expenses? How much would each clerk's average daily sales have to be if there were 40 clerks?

2. A discount of 10 and 5 and 2 per cent. is a discount of what per cent.?

3. What fraction of a grain of strychnine is in the average dose (1 dram) of elixir of iron, quinine and strychnine phosphates?

4. A lump of crude opium weighing $12\frac{1}{2}$ pounds contains $7\frac{1}{2}$ per cent. of morphine. It is dried until it loses 2 pounds of its weight. What percentage of morphine does it then contain?

5. An empty can weighs 1 pound. Filled with distilled water it weighs, with its contents, 11 pounds. How much would it weigh, with its contents, if filled with alcohol?

6. If ice cream, fruit syrup, and carbonated water cost 80 cents, 70 cents, and 5 cents a gallon, respectively; and 2, $2\frac{1}{2}$, and $8\frac{1}{2}$ ounces, respectively, are used in making a glass of soda water, what is the profit on 100 gallons of the product, at 10 cents a glass?

7. Having a 1-in-100 stock solution on hand, and desiring to make 8 ounces of a 1-in-2500 solution by diluting this with water, how much of each should be used?

8. Having a sample assaying 7 per cent. and another assaying $2\frac{1}{2}$ per cent., how much of each should be taken to make the official quantity of tincture of cinchona?

9. When 4 grains of cocaine hydrochloride are dissolved in 1 ounce of distilled water, what is the percentage strength of the solution?

10. Desiring to make 1 fluid ounce (say 455 grains) of a 4 per cent. solution of cocaine hydrochloride in distilled water, how many grains of each should be used?

Answers to January Questions.

1. 20 60/97.
2. 1 gallon.
3. $18\frac{1}{8}$ cents.
4. 10 grains.
5. $3/16$ grain.
6. 36 and not quite $\frac{1}{2}$.
7. $2\frac{1}{2}$ cents.

8. 76.8 minims. (In working percentage of this kind we must have all parts by weight or all parts by volume. As the weight of the elixir is not given, it is necessary to give the answer in volume.)

9. 3 ounces, 5 ounces, 4 ounces.
10. 60.

A Baffling Problem.

"Prescription Clerk," Indiana, writes that he can not figure out the first problem in the November issue, and asks for help. The example reads:

A bottle filled with glycerin weighed, with its contents, 22 ounces avoirdupois; filled with alcohol it weighed 15 ounces. What is the capacity of the bottle in fluid ounces?

First ascertain the difference (preferably in grains) between the weight of the glycerin and the weight of the alcohol. In the Pharmacopœia find the specific gravity of the two liquids, and the weight of 1 fluid ounce of a liquid whose specific gravity is 1, from which data the weight of 1 fluid ounce of each of the other two liquids may be learned. Ascertain the difference between the weights of this given quantity of these two liquids, and then apply the rule of three.

New York Board Questions.

Herewith are reprinted the first set of questions used by the new New York Board of Pharmacy appointed by the regents under the law passed last year. The examination was held February 1st and 2d. Other sets of questions asked by the New York board appear in the issues of the CIRCULAR for October, 1910, page 519; December, 1909, page 642; January, 1909, page 28; January, 1908, page 30; March, 1907, page 274; April, 1906, page 138; January, 1905, page 21; July, 1904, page 157; and some previous ones.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give our readers, just as nearly as practicable, the questions as they were presented to the candidates.

Pharmacist Examination.

Theoretical Pharmacy.

Answer the first six questions and any four of the others.

1. Change the following and show calculations: (a) 60° C. into F., (b) 70° F. into C.

2. Write in Latin and in English the meaning of *each* of the following abbreviations: (a) d. t. d., (b) ft. inf., (c) div. in p. aeq.

3. Give the titles of books that are standards for drugs and medicines in the United States.

4. State how *each* of the following is prepared: (a) mercurial ointment, (b) ointment of potassium iodid.

5. Give the per cent. of the active constituent in (a) Dover's powder, (b) nux vomica, (c) opium.

6. State how *each* of the following U. S. P. products is prepared: (a) rose water, (b) Fowler's solution, (c) syrup of squill.

7. How may the boiling point of a liquid be determined?

8. Define *each* of the following terms and give an official product of each process: (a) evaporation, (b) desiccation, (c) percolation.

9. Name *three* substances used to clarify liquids and state when they should not be used.

10. Medicated waters. State the pharmacopœial titles and the English names. Name (a) *two* that are gaseous solutions, (b) *four* prepared by distillation.

11. Name (a) *five* U. S. P. flavoring syrups, (b) *five* U. S. P. medicated syrups.

12. Give details of the official method of preparing elixir of iron, quinin and strychnin phosphate.

13. Name the ingredients in *each* of the following preparations: (a) paregoric, (b) tincture of iodine, (c) tincture of aloes.

14. Give the method of preparing *two* U. S. P. glycerites.

15. Describe the U. S. P. assay process for jalap.

Practical Pharmacy.

On completion of the work all apparatus must be cleaned; otherwise two credits will be deducted from the rating of the practical work.

Compound the Following:

1. R	Acidi Salicylici.....	8.0
	Natrii Bicarb.....	5.8
	Glycerini	20.0
	Aquae q. s. ad.....	60.0

M. s. a.

Sig. One teaspoonful four times a day in water.

2. R	Phenolis Salicylatis.....	0.3
	Olei Ricini āā.....	no. viii.

M. ft. caps. d. t. d.

3. R	Acidi Tannici.....	1.0
	Opil pulv.....	0.2
	Olei Theobrom. q. s.....	

M. ft. suppos. no. vi.

Sig. As directed.

Manufacture the following:

1. Basham's mixture.....	250.00
--------------------------	--------

[See U. S. P. page 262.]

2. Emulsion of asafetida.....	100.00
-------------------------------	--------

[See U. S. P. page 128.]

Test the Following:

1. Borax, for presence of carbonate or bicarbonate.

[See U. S. P. page 399.]

2. Cream of tartar, for presence of starch or other insoluble matter.

[See U. S. P. page 356.]

Pharmaceutical Chemistry.

Answer the first six questions and any four of the others.

1. Spirit of glyceryl trinitrate. What per cent. of the active constituent should it contain? What precautions must be observed when a considerable quantity is spilled?
2. Glycerite of boroglycerin. How is it prepared? What happens when water is added to it?

3. Write the chemical formula for *each* of the following: (a) calcium carbonate, (b) cream of tartar, (c) sulfurous acid, (d) protoiodid of mercury, (e) Glauber's salt.

4. Define the following terms: (a) valence, (b) isomeric, (c) triatomic, (d) alloy, (e) calcination.

5. Give the chemical name of *each* of the following: (a) C_2H_5OH , (b) $HgNH_2Cl$, (c) $H_2C_6H_2O_7$, (d) KPH_2O_2 , (e) $Na_2P_2O_7$.

6. Complete the following equations:

7. Hamamelis water. Give the official method of preparation. How may the presence of formaldehyd be detected?

8. Citric acid. Give its source. State how it may be distinguished from tartaric acid by chemical means.

9. Give a characteristic test for *each* of the following: (a) ammonium chlorid, (b) lithium iodid.

10. How many grammes of official hydrochloric acid will be required to make 1595 grammes of official diluted hydrochloric acid?

11. How many grammes of metallic zinc may theoretically be obtained from 1 kilo of zinc acetate? [Atomic weight of H = 1, of O = 15.88, of C = 11.91, of Zn = 64.9.]

12. Write the reaction that takes place in the manufacture of official sulfurous acid.

13. State the color imparted to a nonluminous flame by *each* of the following: (a) calcium, (b) barium, (c) sodium, (d) potassium, (e) strontium.

14. Give details of the process for the manufacture of an effervescent salt.

15. Why are many samples of mercurous iodid green instead of yellow? What precaution should be taken to prevent this change in color?

Materia Medica and Botany.

Answer the first six questions and any four of the others.

1. Roman and German chamomile flowers. Give (a) the official title of each, (b) a description of each, (c) the principal constituent of each.

2. Give the U. S. P. requirements for nux vomica. Name another drug having the same active constituents as nux vomica.

3. Define (a) sialagogue, (b) alterative, (c) masticatory, (d) aperient, (e) expectorant.

4. Coca, cacao, coccus. Define each and give the uses or the properties of each.

5. Define embryo. State the different kinds of embryo. Give the class of plants produced from each kind of embryo.

6. Define (a) close fertilization, (b) cross fertilization, (c) hybridization.

7. Colocynth. Give (a) its synonym, (b) its principal constituent, (c) its medicinal properties, (d) the U. S. P. dose.

8. Give the essential characteristics of (a) anise, (b) conium. State the active constituent of each.

9. Strophanthus. Give (a) its botanic origin, (b) its active constituent, (c) the dose of the constituent and of the crude drug, (d), its medicinal properties.

10. Senna. Give (a) the U. S. P. requirements for senna, (b) the commercial terms used.

11. Colchicum. Give (a) the official parts of the plant, stating the dose of each part, (b) its medicinal properties, (c) a description of the seed.

12. Podophyllum. Give (a) *two* synonyms, (b) its principal constituent, (c) the dose of the crude drug and of its constituent.

13. Senega. Give (a) its botanic origin, (b) the habitat of the plant, (c) its active constituent, (d) the U. S. P. dose.

14. Gentian. Give (a) its botanic origin, (b) the habitat of the plant, (c) its medicinal properties, (d) the U. S. P. dose.

15. Define (a) monocious plant, (b) diecious plant.

Toxicology and Posology.

Answer the first six questions and any four of the others.

- In stating the dose of a drug write the name of the drug and unless otherwise specified, state the minimum and the maximum dose.

1. Define the following terms: (a) maximum dose, (b) antidote, (c) true poison, (d) cumulative poison, (e) idiosyncrasy.

2. Name a chemical antidote for *each* of the following: (a) iodine, (b) chloral hydrate, (c) corrosive sublimate, (d) phenol, (e) salt of sorrel.

3. Give an emergency treatment for poisoning by *each* of the following: (a) creosote, (b) arsenic.

4. Mention a physiologic antidote for *each* of the following: (a) veratrum viride, (b) stramonium, (c) cocaine, (d) strophanthus, (e) gelsemium.

5. State the dose of (a) tincture of aconite, (b) san-tonin, (c) Griffith's mixture, (d) morphin sulfate, (e) Fowler's solution.

6. State the dose of (a) salicylic acid, (b) extract of colocynth, (c) spartein sulfate, (d) vinegar of opium, (e) saccharated carbonate of iron.

7. What precautions must be taken when selling schedule B poisons? Name five substances listed in this schedule.

8. Give an emergency treatment for poisoning by *each* of the following: (a) oxalic acid, (b) alcohol.

9. Give a chemical test for the detection of *each* of the following: (a) white precipitate, (b) strychnin.

10. In poisoning by alkaloids what organic acid may be employed as an antidote? How does this acid act?

11. Name *five* narcotic poisons, stating the poisonous dose of each.

12. The adult dose of a drug is 24 grains; state, in the metric system, the dose for (a) a child 5 years old, (b) a child 8 years old.

13. How much strychnin is contained in 30 grains of citrate of iron and strychnin? Would this be a safe dose?

14. State the dose of (a) cerium oxalate, (b) sodium chlorate, (c) syrup of hydriodic acid, (d) tincture of hydrastis, (e) wine of antimony.

15. Name *two* poisonous substances for which the stomach tube should not be employed. Give a reason why it should not be used.

Druggist Examination.

Theoretical Pharmacy.

Answer the first six questions and any four of the others.

1. Convert the following into metric equivalents: 3 i, gr. ii, ʒ ss. Convert the following into Troy equivalents: 2.50 grammes, 14 milligrammes.

2. Give the name of an official preparation made by *each* of the following processes: (a) calcination, (b) fusion, (c) infusion, (d) distillation, (e) decoction.

3. Give the common name of *each* of the following: (a) phenol, (b) tinctura capsici, (c) liquor plumbi subacetatis, (d) syrupus scillae compositus, (e) tinctura opii.

4. Name *five* solid pill excipients.

5. Name *five* official tinctures that are made by the process of maceration.

6. Criticise the following prescriptions:

- (a) R Lead Acetate..... ʒi
 Tincture of Opium..... ʒ ii
 Water enough to make..... ʒ vi

Mix.

- (b) R Spirit of Nitrous Ether..... ʒ ii
 Antipyrin ʒ ss
 Syrup ʒ ss
 Water enough to make..... ʒ ii

Mix.

7. Define the term liniment. Name *five* official liniments.

8. What is the difference between Labarraque's solution and Javelle water? Which of these preparations is official in the U. S. P.?

9. Name *five* official tinctures in which official alcohol is employed as a solvent.

10. Name a good solvent for *each* of the following: (a) camphor, (b) potassium iodid, (c) sulfur, (d) menthol, (e) quinin sulfate.

11. Lead acetate when dissolved in water usually yields a turbid solution; why does the solution become turbid? What can be done to obtain a clear solution?

12. How many pounds of official ammonia water can be obtained from 100 pounds of stronger water of ammonia?

13. Give the per cent. of the active constituent contained in each of the following: (a) tincture of digitalis, (b) wine of opium, (c) emulsion of codliver oil, (d) solution of hydrogen dioxid, (e) infusion of digitalis.

14. How does a fluidextract differ from a tincture?

15. State how to determine the specific gravity of a substance lighter than water but insoluble in water.

Practical Pharmacy.

On completion of the work all apparatus must be cleaned; otherwise two credits will be deducted from the rating of the practical work.

Compound the Following:

1. R Strychninae Sulph..... gr. 1/30
Acidi Arseni..... gr. 1/60
Ferri Reducti..... gr. 1
Ext. Gentianae q. s.
M. ft. pill d. t. d. no. xxx
Sig. Unam t. i. d.

2. R Quininae Sulph..... 1.0
Acidi Sulph. q. s.
Syrupi..... 30.0
Aquaе q. s ad..... 60.0

M.

Sig. Teaspoonful every two hours.

Prepare the Following:

1. Tr. Ferri Chloridi..... 50.0
[See U. S. P. page 464.]
2. Ung. Hydrarg. oxid. rubri..... 10.0
[See U. S. P. page 494.]

Pharmaceutical Chemistry.

Answer the first six questions and any four of the others.

1. Spirit of camphor. What strength is required in the U. S. P.? What happens when water is added to it?

2. Aromatic syrup of rhubarb. What kind of rhubarb is used in its preparation? What alkaline salt is used in its preparation and for what purpose?

3. Tincture of iodine. Should it be prepared in large or in small quantities? Give reasons for answer.

4. Solution of magnesium citrate. Name the ingredients used in making this solution. What reaction occurs when potassium bicarbonate is added?

5. Yellow wash. How is it prepared?

6. Give the official name of *each* of the following: (a) copperas, (b) Rochelle salt, (c) cream of tartar, (d) green vitriol.

7. Define the following: (a) maceration, (b) univalent element, (c) inorganic chemistry, (d) base.

8. Define the following: (a) calcination, (b) incineration, (c) atom, (d) crystal.

9. Write the chemical name of *each* of the following: (a) white lead, (b) blue vitriol, (c) white vitriol, (d) salt-peter.

10. Syrup of hypophosphites. What ingredients enter into its preparation? Why is diluted hypophosphorous acid used in its preparation?

11. Name the boiling and freezing points on the centigrade and on the Fahrenheit thermometer.

12. Wine of antimony. Name its constituents. Which is its active constituent?

13. If calomel is mixed with lime water what is the mixture called? Describe the reaction.

14. Give the chemical name of *each* of the following: (a) H_2SO_4 , (b) KNO_3 , (c) HI.

15. Complete the following equation: $CaO + H_2O =$

Materia Medica and Botany.

Answer the first six questions and any four of the others.

1. Define (a) botany, (b) materia medica.

2. What is meant by (a) tuber, (b) seed, (c) radix, (d) pollen, (e) petal?

3. Define the following terms: (a) anodyne, (b) styp-tic, (c) hydragogue, (d) hypnotic, (e) astringent.]

4. Differentiate fixed oils and volatile oils. Give an example of each.

5. *Prunus virginiana*. Give (a) the common name, (b) the part used, (c) its valuable constituent, (d) its official preparations.

6. Give the official name of *each* of the following synonyms: (a) gray powder, (b) carron oil, (c) spirit of mindererus, (d) Basham's mixture, (e) Fowler's solution.

7. Name (a) *four* official products derived from the sheep, (b) an official insect that infests the cactus tree.

8. From what is *each* of the following obtained: (a) iodine, (b) salol, (c) atropin, (d) thymol, (e) santalin?

9. Name the active principles of *each* of the following: (a) aconite, (b) Calabar bean, (c) digitalis, (d) colocynth, (e) hyoscyamus.

10. Give the official part of *each* of the following: (a) glycyrrhiza, (b) gentian, (c) quassia, (d) macis, (e) lobelia.

11. Give the common name of *each* of the following: (a) hedeoma, (b) lactucarium, (c) marrubium, (d) mentha piperita, (e) saccharum.

12. Name *four* official mineral acids.

13. Give the pharmacopœial titles of *five* official leaves.

14. Give the source of *each* of the following: (a) pepsin, (b) spermaceti, (c) oleum morrhuae, (d) cantharis, (e) coccus.

15. Give the source of *each* of the following acids: (a) citric, (b) tannic, (c) oleic, (d) oxalic, (e) tartaric.

Toxicology and Posology.

Answer the first six questions and any four of the others.

In stating the dose of a drug write the name of the drug and unless otherwise specified, state the minimum and the maximum dose.

1. Define (a) toxicology, (b) posology, (c) poison.

2. What is the dose of (a) menthol, (b) pancreatin, (c) extract of henbane, (d) tincture of digitalis?

3. What is the dose of (a) acetanilid, (b) calcium chlorid, (c) camphor, (d) reduced iron?

4. What is the dose of (a) cocain, (b) codein sulfate, (c) bismuth subgallate, (d) ammonium chlorid?

5. Give an emergency treatment for poisoning by (a) oxalic acid, (b) Paris green.

6. How many grains of cocain are required to make 4 ounces of a 4% solution.

7. Define chemical antidote.

8. What is the dose of (a) tincture of belladonna leaves, (b) fluidextract of quassia, (c) diluted hydrochloric acid, (d) hive syrup?

9. What is the dose of (a) potassium nitrate, (b) salol, (c) terpin hydrate, (d) sodium bicarbonate?

10. Define (a) demulcent, (b) cumulative poison.

11. What is the dose of (a) tincture of cantharides, (b) fluidextract of ipecac, (c) aromatic sulfuric acid, (d) syrup of lactucarium?

12. What is the dose of (a) phenol, (b) tincture of cinchona, (c) croton oil, (d) spirit of anise?

13. State the symptoms of poisoning by phosphorus. Name the antidote for phosphorus.

What treatment should be employed in poisoning by concentrated lye?

15. What is the best antidote for poisoning by corrosive sublimate? How is this antidote used?

Solution of Iodine for Skin Sterilization.

Delangre (*Presse méd.* through *N. Y. Med. Journ.*) suggested to the 1910 Congress of the Association Française de Chirurgie the following formula for a stable solution of iodine which, he claimed, applied thrice, renders the skin perfectly sterile, without exerting any caustic action:

Iodine 45 grains.

Sodium borate..... 45 grains.

Alcohol 1 ounce.

Ether 1 ounce.

Chloroform 1 ounce.

The sodium borate does not go into solution.

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

A Good Stamp Story.

Newark, N. J., January 29th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Taking advantage of your standing invitation I am sending you the following, feeling quite sure that it will be of interest to those druggists who regard the selling of stamps as a nuisance, yet recognize the fact that the average person will continue to go into a drug store when in need of that article, and the only thing for them to do is to sell the stamp and make themselves as agreeable as possible while doing so. I long ago made up my mind that the best policy in any business is to have the customer leave the store in a pleasant frame of mind, and while I am not any more fond of rushing out in the store because some one is trying to see how many blows it takes to break the glass in a case, when the instrument used is a nickel, and find that it is only a stamp customer, still I always remember to look pleasant in time, because I have a steady stamp customer who once taught me a lesson that I will never forget, and the best part of it is that he doesn't know it. While this isn't really what I started out to say, still it may do some good.

I had noticed for some time that this particular customer had been getting stamps regularly, and a careful watch on the part of my clerk and myself proved that he never bought anything else. I had just about made up my mind that he had gone the limit, and was only waiting for an opening to tell him that we sold stamps for the accommodation of customers only. This was really hard to do as he was quite a pleasant man to speak to. I'll never forget my surprise when he came in one morning, slung a grip on the counter and said, "My wife has been cleaning house this week and told me to bring these empty bottles to you as she thought you might have some use for them." I was mighty glad then that I hadn't told him what I thought he deserved, for I recognized by the bottles that his wife was really my best customer, as she ran a good-sized boarding house in the neighborhood, and you can imagine that there was quite a little revenue coming from that direction. So you see you never can tell.

What I started out to say is this: About three months ago I started a little plan that is producing the results that I hoped it would. Since the experience cited above I have been able to sell a stamp and throw in a pleasant word besides, and my clerks the same, but it is a well-known fact that the average stamp customers either have never heard the words "please" and "thank you," or if they have, have evidently forgotten how to use them. Whether it is because, with the perversity of human nature, knowing that the druggist dislikes to sell stamps, they, to use a common expression, like to rub it in, or whether they act so unmannerly simply to repay the druggist for the manner in which he hands them their stamps

I am not prepared to say, but I am free to confess that I thought it wasn't fair to me to make me suffer for the sins of my brothers, especially as I was handing out the same kind of a smile with a two-cent stamp or even a postal-card that I was when I was handing over something on which there was some return for my investment. I felt it was unjust and had about made up my mind to go through life a martyr unknown and unhonored, when I was suddenly struck by an idea. The more I thought of it the better it seemed, and now I can truly say that it is a pleasure to sell stamps, because this plan works in two ways—either the customer buys something on which there is a profit, or if he doesn't, he thanks you for the stamps anyway, while some people not only buy, but thank you as well, and greater happiness needs no druggist. The plan is so simple that those who have never tried it will be apt to toss it aside, but a little thought will show that it will work if it is applied in the right spirit, and I might say here that the spirit is really more important than the plan itself. The first time I tried it I was delighted with the result, and now, three months after using it, I really think that it solves the stamp problem.

This is how it works out: When the first man I tried it on asked for a stamp I could plainly see that it was his intention to take the stamp and walk off, ignoring me completely. He had got what he wanted and therefore had no more use for me until he wanted a stamp again, when he would simply repeat the performance. But he didn't know that I had a remedy and that he was marked for the one on whom the test was to be applied. As I gave the man his stamp I looked him right in the eye, and in my most gentlemanly manner I said, "Is there anything else you would like to have?" He fell like a bear in a trap. "Why yes, thank you, I'll have a cigar if you don't mind."

GEORGE I. SCHREIBER.

[We have always heard it maintained that there were other ways of killing a dog beside choking him to death with warm butter; and we believe there are just as many ways of selling a stamp. Brother Schreiber's is certainly a good one—in his hands—and we should like to hear how it works in the hands of others who may try it. Incidentally we should also like to hear of any other plan which gives equal satisfaction.—Editor THE DRUGGISTS CIRCULAR.]

Solving the Fly Problem.

1156 Third street, Milwaukee, Wis.

To the Editor of THE DRUGGISTS CIRCULAR:

As an unmitigated nuisance to the druggist during the hot summer months flies certainly take the first prize. They congregate in vast numbers on the screen door and on the newly cleaned windows outside, and take the first opportunity to fly in when the door is opened. I have tried various schemes to get ahead of them, and used various concoctions for their annihilation, the latter being all right in the store but absolutely worthless outside. Then finally, after I was convinced I was "up against it good and hard," I had an illuminating idea which at first seemed so absurd that I was laughed at by several friends to whom I mentioned it. However, I decided to put it into effect, and now the laugh is on the other side.

I purchased a half dozen small so-called American chameleons, a small tropical lizard (*anolis principalis*) and set them on my screen door on the outside. These small lizards feed mainly on insects—and therefore the slaughter of the innocents. I had invited several of my skeptical friends to witness my first attempt, be it failure or success. The sight was amusing. It was not long before there wasn't a solitary fly left. The majority, of course, escaped, but stayed away from the vicinity.

Since that time I have always put out my chameleons when the flies were thick. Of course, some times I have to go after them with a ladder to get them back, but on the whole the results are worth the trouble. When the little beasts are not at work they may be kept in a small box. They become very tame, allowing themselves to be handled by anybody.

Having had such success with my plan I decided to suggest to my fellow sufferers that they try it; hence my letter to you. Incidentally, the lizards may be kept in a room all summer and keep it clear of flies and other insects. If anyone wants to try this plan and does not know where to obtain the lizards, let him write to me for the address of a dealer.

ADOLPH BIRSACH.

[In writing to Mr. Biersach the seeker for information should enclose a stamped return envelope.—Editor THE DRUGGIST CIRCULAR.]

Should Doctors Be Allowed to Dispense?

Down South, January 20th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

The *Medical Summary* for December, 1910, under "Notes and Queries" has an article entitled "Doctors Should Be Allowed to Dispense," written by W. H. C., M. D., of Mississippi. The doctor, whoever he may be, seems to think that the medical college gives all the education required for the proper dispensing of medicines, and doesn't seem to realize, as most physicians do, that the art of prescribing is one thing and the art of dispensing entirely another. We have probably as many honorable men in the drug business as could be found in the medical profession, and the accusation made by our friend that it often occurs that the druggist will substitute is entirely unfounded, and just because, like the doctor's profession, we unfortunately have some unprincipled men in our ranks, is no reason that the doctor, who does not know anything at all about dispensing, as a rule, should be burdened with this unnecessary task.

The doctor gives as his main reason for the law that doctors should be allowed to dispense, that a doctor who was ten to twenty miles from a drug store would have to dispense his own medicines, and in this instance we would say the doctor who would send his patient who lived that far from the store, to the store to have his prescription filled, would be a little less than human.

I feel sure that the time will come, and I think not far in the future, when the doctor will realize that it takes a man who is well posted to fill properly his wants, and he will rely entirely on the skill of the pharmacist to do this. The experience of the writer is that the most serious and most often substitution comes from the doctors dispensing, from the fact that when the druggist gets a prescription from the doctor

and calls him up (as most druggists do) to inform him that the article required is just out, then the doctor jumps on the druggist to know why he doesn't keep those things required to fill his prescriptions; but on the other hand when the good doctor is doing the dispensing himself, and he looks over his glasses in a very knowing manner for the very drug he has in mind as the best thing for his patient, and finds he is "just out," he will say to himself, "I will give him some of this, it's just as good." This is a fact, and I know it to be true from being intimately associated with physicians who owned their drug stores for the past fifteen years.

Of course I have spent enough time in the drug store, and associated with physicians enough to know that in a great majority of instances the drug that is given has not all to do with the patient's recovery, and that oftentimes the patient would recover without medical aid. A physician who had had several years' experience said to a young recruit at one of our State medical meetings, "Stay away awhile and give the people in your community a chance to get well," saying that 90 per cent. of the people who got sick would get well without medical aid, that the doctor could cure 5 per cent., and the other 5 per cent. would die regardless of medical treatment.

Now if the good old medical profession will just give us our just reward and not get the idea that they are the only ones that know it all, we will prove a great help to them in many ways, we being really their protectors, and relieving them of a very disagreeable part of the job.

D. M. F.

Condemns Dispensing by Physicians Equally with Prescribing by Pharmacists.

New York, January 31st, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Reading your comments on the several letters appearing in the January issue of your CIRCULAR on the question of dispensing by physicians, I couldn't help being struck by your partiality in the matter. You seem to take it for granted that anything that is legal must necessarily be morally right at the same time.

Viewed in the light of ethics and public safety, dispensing by physicians is just as much to be condemned as prescribing by pharmacists, and if one is made illegal there is no reason why the other shouldn't be made so too.

After all, physicians are only human beings and are not exempt from the faults of such. As a class they are not morally higher than pharmacists, and the public should be safeguarded against them as it is against pharmacists.

That a law prohibiting dispensing by physicians is justifiable and practicable is proven by the fact that such a law does exist in a number of European countries. Why shouldn't we make an effort to enact it here too? And why shouldn't pharmaceutical organs advocate such a measure instead of putting it to ridicule. I am sure it is their business to work for the best interests of the profession and not against them.

In conclusion, I want to say that it is not lack of confidence in pharmacists that prompts a physician to dispense his own medicines; in the majority of cases he is actuated by selfish considerations and does it simply because there is money in it.

Let us hope that the time is not very distant when

a stop will be put to this practice which works harm to the public as well as to us. T. SHAPIRO:

[As to just how to serve the best interests of pharmacy there seems to be an honest difference of opinion. Some seem to feel that they are serving the best interests of pharmacy by antagonizing and abusing physicians. We feel that these same interests are best served by co-operation between the pharmacist and physician. A trap baited with sugar catches more flies than one in which vinegar is used.—Editor THE DRUGGISTS CIRCULAR.]

Practicing Pharmacy and Medicine in a Small Southern Town.

Brandeville, S. C., January 19th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

The reading of Mr. Stieber's letter in your January number [page 37] has decided me to try my hand on the subject. Mr. Stieber is right about the starvation part, but there is another part that holds in this part of the country where we have quite a number of negroes and that is this: They look on everyone connected with a drug store as a doctor, and if you don't prescribe for them in simple ailments you will lose their patronage. The reason of this is that in small towns the physician owns the store and will prescribe for them. So every pharmacist will counter-prescribe—a very undesirable thing on my part.

Now as to the sale of opiates: I will not sell except on a prescription or to a person I think responsible.

I am not trying to get up a controversy, but to express my views on the subject, and we pharmacists had just as well drop the subject of the physician dispensing and the pharmacist prescribing as nothing will be done to benefit either. As long as the world rolls on the physician will be on top, as very few people look on pharmacy as a profession in this day and time; and the physician has been dispensing since time immemorial and will very probably continue, with pharmacists in the opposite role.

I would also like to remark on Mr. Merin's article: He is right in saying that the boards of health (composed of physicians) have no right to regulate pharmacy, and that physicians are responsible for a good many opiate fiends by being too quick with the "hypo." But why criticize the whole medical profession for the action of a few? Have we not men in our profession who are convicted in the courts for violating the cocaine laws? He claims in his article that his friend cured the patient with a dose of castor oil. Well, he censures that friend in his article, for he said "physicians." As you say, the same physicians are getting along well without our help, and it is up to us.

Now where I register my kick is against general stores, etc., handling the poisonous articles in original packages, while a non-licensed man cannot sell them, even under the supervision of a licensed man. That is the condition the druggists of this State have to buck against.

I have written more than I intended, so will call it off, as this is my first time. I hope that pharmacy will eventually come into its own honestly and without unnecessary knocking. JOHN F. HUCHTING.

[With this letter was enclosed an order from a

negro, recently filled by Mr. Huchting. It reads:

Some loddounn.
Some shoe tax.
Some isidine.

The second item calls to mind the little bins of assorted sizes of shoe pegs which used to stand in a row in the general store to which the writer was sent on errands when a small boy. We did not know that this commodity was ever sold by druggists.—Editor THE DRUGGISTS CIRCULAR.]

A Clerk's View of Present-Day Pharmacy.

We have been favored with a communication from a Chicago drug clerk which, while containing a number of suggestions worth considering, is far too long for publication here, as it would occupy perhaps five pages in the CIRCULAR. The writer touches upon a variety of subjects—indeed he "scatters his fire" too much, and shows a tendency to pull down rather than build up—but he refers to one phase of the drug business in a manner which makes interesting reading. He says:

"I worked in a store in an Indiana city of about 60,000, the stock of which would invoice about \$15,000. This store did a business of about \$20,000 annually. The prescription section was the indifferent part of the business, the prescriptions averaging about two a day. I was the only registered man beside the proprietor, who was also a city official. Besides myself there was a camera man and a cigar clerk, but no porter. Who do you think did the porter work? Why, 'yours truly.' The camera end was the big part of the business. Being a man of some family, the meager salary I was getting did not quite make both ends meet. I repeatedly asked the proprietor for some slight increase, after vainly talking to him about the virtues of the N. F. and U. S. P. propaganda, so he came to me one day and told me that although he realized that I knew the drug business and was quite proficient, he had no occasion for a high-class man and could not meet my demands for an increase of salary, and that he had already selected a cheap man. This druggist had the hybrid fever bad, wanted new lines and new lines, howling that the drug business was a back number. This man was actually discouraging all professional business that came to his store. It is true he had quite a stock of bottles and corks, which the many physicians in the town bought, but he made no effort to compete with the manufacturers who were supplying these physicians with their drugs and preparations."

The lack of professionalism among pharmacists and the loss that they sustain through such lack, seems to be the burden of this drug clerk's cry, for he goes on, in another place, to say:

"I have known many senior medical students and young M. D.'s to come to the pharmacist for advice, looking to him for their learning in materia medica and therapeutics, admitting that their colleges did not teach them that particular subject as they knew the pharmacist knew it. How did the pharmacist treat those men but from an arrogant, egotistical standpoint, saying there was nothing in those fellows, anyway? At least too busy with their side lines and at most what a direputable looking sight the average drug store library is. We have allowed many advantages to slip by. The senior medical students and young

M. D.'s were quickly taken care of by the specialty men and drug baron; how well they finished his insufficient education in materia medica and therapeutics, you too well know to need comment here. Let us give credit where credit is due. We know that the medical profession is not a supporter of the department store variety of drug store so long as there remain individual pharmacies wherein the serving of the prescriber is the first law and his wishes are supreme.

"The professions of pharmacy and medicine cannot be separated without serious loss to one or the other. They are as husband and wife—estrangement may come but sweeter conciliation must follow; the advancement of one must be followed by an equivalent betterment in the other; the loss of one is the loss of the other. The educated physician of to-day is fresh from the lecture room on modern therapy, hygiene and bacteriology, fresh from the sterile operating room and hospital, the logical man to be your associate and friend. Think what a world of work there is in helping him keep the people well, rather than curing them when they are sick. Is it a wonder that he shuns you with your soda fountain and expectorating cigar customers?"

"Can we ask recognition and reciprocity from physicians, members of our sister profession, before we show them our aims and worthiness and can recommend necessary respect for them from our followers. Medicine long ago discovered that a strict adherence to its code of ethics meant professional life, and violation of the same meant professional death. The importance of the code is taught to the student the first thing after he enters the college portals. How the physician respects it we all well know. The easily discouraged one who tries anything inconsistent with its teaching, such as indulging in quack advertising or other obnoxious methods, is quickly ostracized from the ranks of the profession and looked upon with disrespect and disgust by his fellow members. To exist as a profession with the necessary respect attending it, we must follow along similar lines. We must make ourselves powerful enough to be a desirable friend and ally of the medical profession. To be its enemy, as some have counselled, and still exist as a profession, is impossible. If they have erred against us it has been through ignorance of our worthiness. Let us be patient with them and teach them different. Let us assist each other to ostracize one another's quacks. Let us establish reciprocity between the two professions regarding dispensing by physicians and prescribing by pharmacists. Let us associate, confer and advise with a view to securing necessary legislation for each other's benefit.

"'Patent' medicines have been the cause of much discussion and perplexity. What have we achieved by all our menaces, which have been many and ferocious? What advantage have we derived from the many plans we have tried? Pharmacists, proprietors of drug stores, why do you allow every shyster and piker who thinks he has some wonderful 'dope,' often as not something pilfered from the Pharmacopœia or National Formulary, whose virtues he has exaggerated beyond recognition, to stuff your shelves with unprofitable goods, inconsistent with sensible pharmacy and medicine, disreputable trash advertised to a gullible public, and with you as a party to the guilt? How soon are we going to use our efforts to eliminate this useless parasite? We are patting

ourselves on the back, because some of our organizations have made resolutions against the sale of baby killers. Not so very long ago, several prominent periodicals exposed a number of prominent fakes, to be found in most drug stores. Did you go on record as against the sale of them? What a splendid opportunity you had to show your interest in public welfare. You still have them on your shelves. Is it because you are making so much money on them? Surely not. Is it because you are waiting for the other fellow to stop selling them first? When are you going to stop giving the most prominent places in your stores for the showing of all the beautiful lithographs and displays with which your foxy 'patent' fakers are supplying you? So Chesterfield-like in them, is it not? If you only knew what an insult it is to your profession, how it disgusts the man who should be your most powerful ally and friend, you would stop it."

Before closing, this clerk offers a few suggestions to and about clerks. In this connection he says:

"We should discourage our fellow-members from giving their services to cut-rate stores, and discourage the exaction of porter services from registered men. We should encourage sanitation and hygiene as becomes our relation with advanced medicine; encourage the equipment of drug store laboratories with proper manufacturing utensils; encourage the propaganda for the greater use of official drugs; and try to establish a scale of salaries, and hours of labor. Above all, we should endeavor to impress upon the young clerk with insufficient assets, the folly of entering business on his own account."

The Scope of the Pharmacopœia.

Writing in the *Critic and Guide*, Dr. Solomon Solis-Cohen, of Philadelphia, chairman of the subcommittee on admissions and deletions of the pharmacopœial revision committee, summarizes the question of what the Pharmacopœia should contain in the following manner:

The Pharmacopœia is a book of pharmacal standards and neither an advisory nor a minority work on therapeutics.

Admission or rejection should depend on the voice of the whole profession, and not on the voice of teachers or leaders only, whether pharmacologists, clinicians, or therapeutists.

Many preparations of one drug are permissible, when desired by physicians in general.

Many drugs of similar action are permissible and even necessary.

Active principles should not displace the crude drug and galenic preparations, unless physicians in general all agree that the active principle is the only necessary or desirable preparation.

Monopolization by patent or trade-mark should not exclude a drug otherwise proper to be admitted.

In the case of trade-marked names legal advice should be taken as to the best method of procedure.

In the case of process-patents and product-patents, the effort should be made to use pharmacopœial control and standardization to the mitigation of the evils of high price and uncertainty of product possible under the present bad system.

A determined effort should be made to modify the laws of the United States so that in the case of medicines, processes only, and not products, can be patented.

Trade-marks can only be manufacturers' brands, and hence the common name of a medicine cannot be used as such. If this is not good law at present, it should be made such by statute.

Notices of Books Received.

A TEXT-BOOK OF BACTERIOLOGY, a Practical Treatise for Students and Practitioners of Medicine. By Philip Hanson Hiss, Jr., M. D., and Hans Zinsser, M. D. With one hundred and fifty-six illustrations in the text, some of which are colored. Octavo; cloth; xiv+745 pages. New York and London: D. Appleton and Company. 1910.

Leaders in medical thought, men able to forecast the future of their profession from a thorough acquaintance with the relative influence of the various leavens at work in the fabric of medical practice, have frequently expressed the belief that bacteriology will some day come to be almost all of medicine. At this day the progress in medical bacteriology is more rapid than is that of any other branch of the healing art. So rapid, in truth, are the strides, that the successful clinician knows that he cannot keep pace with them and is turning to the trained pharmacist for assistance in laboratory diagnosis. And the wide-awake pharmacist is equipping himself so as to be found not wanting.

In this book Drs. Hiss and Zinsser have presented in concise form the present-day knowledge of pathogenic bacteriology. From the wide realms of technical bacteriology they have drawn examples tending to clarify the medical phase of the subject and have laid particular stress upon the fundamental principles. The newer things in medical bacteriology, the side-chain antitoxic reaction, the lytic process, and the serum diagnoses are comprehensively treated. A valuable section is devoted to diseases of unknown etiology. The final section deals with the subject of bacteria in air, soil, water, and milk.

PHYSICAL CHEMISTRY, Its Bearing on Biology and Medicine. By James C. Philip, M. A., Ph. D., D. Sc. Duodecimo; cloth; vii+312 pages. New York: Longmans, Green and Co.; London: Edward Arnold.

In presenting for the instruction of his readers the application of physico-chemical principles to biology, physiology and pathology the author begins with the phenomena of the behavior of gases; leads them by way of absorption through solutions, and the osmotic phenomenon to the broad subject of the behavior of solute and solvent: Electrolytic dissolution which has recently been widely applied in physiological chemistry is treated at length; and following this chapter is a comprehensive presentation of the subject of colloids. Adsorption and chemical equilibrium, quite essential principles of physiological chemistry, are the subjects of several chapters.

THE SCIENTIFIC AMERICAN CYCLOPEDIA OF FORMULAS, Partly Based upon the Twenty-eighth Edition of Scientific American Cyclopaedia of Receipts, Notes and Queries. Edited by Albert A. Hopkins. 15,000 Formulas. Octavo; vii+1077 pages. \$5. New York: Munn & Co., Inc. 1911.

As long as the drug store is required to be a supply depot for glues, shoe polishes, inks, egg dyes, soda water, toilet preparations, battery fluids, clothes cleaners and a thousand and one other household needs (to say nothing of the versatility as tinker, electrician, and free consulting chemist so essentially a part of the qualifications of the successful druggist) so long will the drug-store keeper have a need for a vade-mecum

of the nature of this formulary. Formulas are not the all-powerful agents that some folks seem to believe; but formulas replace a great deal of preliminary experimentation when one desires to produce a given result. This compilation of formulas will help in that way in the following matters: Dairying, farming, renovating, metal working, art, foods, beverages, textiles, painting, photography, perfumery, cosmetics, entomology, and some more.

Many druggists doubtless are familiar with the former formulary issued by the *Scientific American*. The present volume has all the good points of its predecessor and a number of improvements. Chief among these latter is a comprehensive index practically indispensable in any work of reference.

"SALVARSAN" or "606" (Dioxy-Diamino-Arsenobenzol), Its Chemistry, Pharmacy and Therapeutics. By W. Harrison Martindale, Ph. S., F. C. S., and W. Wynn Westcott, M. B., D. P. H. Octavo; xv+77 pages. \$1.50 net. New York: Paul B. Hoeber. 1911.

Pharmaceutical as well as medical minds are to-day occupied with the new medical science of chemico-therapy; and Ehrlich's "606" is the cynosure. One must begin with the synthesis of a chemical medicament to reach a sound knowledge of its application in pathology. And thus have the authors of this book taken up the study of dioxy-diamino-arsenobenzol.

Its timeliness is but one of the recommendations of this volume; not the least of these is its comprehensiveness. Many are the pharmacists who will be interested in the various chapters, particularly those pharmaceutical in their nature as having to do with the preparation of the drug for administration.

SOME KNOWN AND THREE NEW ENDOPARASITIC TREMATODES FROM AMERICAN FRESH-WATER FISH. By Joseph Goldberger. (2) ON SOME NEW PARASITIC TREMATODE WORMS OF THE GENUS TELORCHIS. By Joseph Goldberger. (3) A NEW SPECIES OF ATHESMIA FROM A MONKEY. By Joseph Goldberger and Charles G. Crane. Bulletin No. 71, Hygienic Laboratory, Public Health and Marine-Hospital Service of the United States.

THE PRODUCTION OF VOLATILE OILS AND PERFUMERY PLANTS IN THE UNITED STATES. By Frank Rabak. Bulletin No. 195, Bureau of Plant Industry, United States Department of Agriculture. Octavo; paper; 55 pages, illustrated. Washington: Government Printing Office. 1910.

PROCEEDINGS OF THE NORTH CAROLINA PHARMACEUTICAL ASSOCIATION at the Thirty-first Annual Meeting, Held at Charlotte, June 8th to 10th, 1910.

PROCEEDINGS OF THE CONNECTICUT PHARMACEUTICAL ASSOCIATION at the Thirty-fourth Annual Meeting Held at Morris Cove, June 14th and 15th, 1910.

SEVENTEENTH ANNUAL REPORT OF THE COLORADO BOARD OF PHARMACY for the Year Ending July 2d, 1910.

EIGHTH ANNUAL REPORT OF THE SECRETARY OF COMMERCE AND LABOR, 1910.

Some Board Questions Answered.

Students sometimes have the germ of an idea, but develop it along peculiar lines. For instance, a college professor tells of a student who was applying the heat of an alcohol flame to a liquid in a flask held in place by a movable ring on a retort stand. The distance between the flame and the flask being too great, the instructor told the student to bring the heat closer to the liquid, expecting him, of course, to lower the ring. But the student's mind worked along original lines, and prompted him to do literally what the instructor had told him to do, namely, to bring the heat nearer to the liquid, and this he did by putting books under the lamp. If teachers and examiners would only be explicit in their instructions and questions, and would try to look at the results and answers from the students' standpoint, many things which seem ridiculous to them would not happen, and many that do happen would seem less ridiculous.

Partly to supply a basis for a psychological study by teachers and examiners, and partly to show to board candidates some "awful examples" which they should strive not to add to, we have made a collection of authentic answers to board questions as given by candidates for licenses, and present an installment of them herewith. Of course nothing could be further from our object than a desire to humiliate ignorant or over-nervous candidates by publishing their remarkable answers. On the contrary we feel that what we are publishing will be of benefit to candidates as well as to examiners. The State in which the answers were given is indicated, except in cases in which it is withheld by request; and sometimes the question appears and sometimes it is left to the imagination. It should be borne in mind that often the poor pharmacist is more glib at answering questions than the good one, and frequently a man who knows is so embarrassed by the fact that he is undergoing an examination which means much to him, that he says or does foolish things that he would never be guilty of in real business.

New York.

Q. How is decolorized tincture of iodine prepared?

A. It is made by taking iodine which has a color and subliming it with animal charcoal when it loses its color. It is then dissolved in alcohol. Wood charcoal is not so good.

Q. What is meant by the term "official" as used in pharmacy?

A. Official means something that has power or authority. Example: The mayor or a policeman.

Q. What is "hive syrup"?

A. Hive syrup is a syrup which contains squill and many other things, but particularly honey. As honey is obtained from the bee and as the bee has its nest in a hive the syrup is called hive syrup.

Q. How would you ascertain whether or not a drug was exhausted?

A. I do not understand the question. The only way I understand the meaning of this word is when one has worked hard all day in a drug store, then one is exhausted.

Q. What is meant by the term "temporary hardness" as applied to water?

A. When it is frozen.

Q. Name five solvents employed in pharmacy.

A. [The candidate named five leading wholesale firms. He was a German, with a "book" knowledge of English and had construed the term "solvent" to mean the opposite of "insolvent."]

Q. Translate the following abbreviations into English: S. a., T. i. d., etc., etc.

A. S. a. means South America.

Q. What is the meaning of p. r. n.?

A. Don't leave without the money.

Pennsylvania.

Q. From what is arrow root obtained?

A. Arrow root is obtained from the root of the arrow.

Q. Why is HCl used in purifying animal charcoal?

A. Because no other acid would act the same way as HCl.

Q. Why is powdered aspidium not a reliable form in which to administer this drug?

A. Because it will not make as firm a mass as glycyrrhiza and has not the same action.

Q. Why is the name belladonna applied to "deadly night shade"?

A. I think the name d. n. s. as applied to belladonna is merely a legend handed down for some time to the effect that belladonna was more active in the night shade than any other time and more poisonous in the night than at any other time.

A. Because if you take a dose it's good night for this earth.

A. Because the people in the country from where it grows have known of falling over by just walking by the tree at night showing that it must be a very poisonous drug.

Q. Why is sodium bicarbonate directed to be dissolved in water not exceeding the temperature of 50° C. in making saccharated ferrous carbonate?

A. So as not to drive all its water of crystallization off.

A. White wine is made from acetic acid and water and alcohol.

A. Red wine is made from antimony.

A. When white wine is prescribed on your specification you should use vinegar of squills.

A. White wine is made by distilling starchy matter and carbohydrates.

A. 350 c.c. linseed oil sp. gr. 0.925 weighs 48562½ grains. 350 gm. the same.

New Jersey.

Q. What is the penalty for conducting a drug store without a registered pharmacist in charge?

A. First time the board of pharmacy have a right to close up the store, on second time the man can be sent to jail for life.

Q. What is the average dose of quinine sulphate?

A. Average dose 40 grains.

A. The dose of corrosive sublimate is 3i.

Q. Name an antidote for carbolic acid poisoning.

A. Alcohol. I think it is to be rubbed on the stomach.

Q. Name an antidote for opium poisoning.

A. Keep patient in a horizontal position.

A. A physiological antidote is one that moves the bowels.

A. A chemical antidote is where you give a chemical for an antidote.

Maryland.

Q. Write a prescription for 2 fluid ounces of an eye wash containing 1 in 400 zinc sulphate.

A. R Zinc sulphate..... grs. xvi.

Aquaæ ʒil.

Glycerin q. s.

Q. Make 8 fluid ounces of compound infusion of gentian.

Although a percolator and stand were on each working table, one candidate poured boiling water on the powdered drug, and after allowing it to macerate about fifteen minutes, strained it through his handkerchief, which did not seem to be overclean. This candidate's work was all on a par with this, yet he could not understand how he failed, as he thought the examination exceptionally easy.

Georgia.

(From an Oral Examination.)

Q. What is spirit of Mindererus?

A. Rerus dissolved in alcohol.

Q. What would you do in a case of morphine poison?

A. Give an emetic and use a breast pump. [Only slightly off, and on a "technicality" at that.]

Q. Define an escharotic.

A. Something to produce child-birth.

Q. State the difference and resemblance between organic and inorganic chemistry.

A. The question upon the face of it is absurd. One is a thing with life; the other a thing without life. You might as well ask me what relation a cow bears to the grass it feeds upon. The cow grazes upon the most luscious grass at the dictation of its own will, moving from place

to place, while the grass is a fixture, manifesting no manifestation of its own manifesting.

Tennessee.

Q. Give habitat of wild cherry and an official preparation.

A. Virginia; fluidextract wild cherry [naming the maker, a large pharmaceutical manufacturing house.]

Q. Give composition of Fowler's solution and the dose.

A. Composition, bicarbonat potash, oil anise, alcohol and water. Dose, teaspoonful.

Q. Give medical properties of tincture of gelsemium.

A. Used in cases of worry; largely used by criminals about to be executed.

Name of State Withheld.

Q. (a) Define specific gravity. (b) How is the specific gravity of solids obtained. (c) Illustrate how you would use specific gravity in pharmaceutical work. (d) Mention four substances of low specific gravity. (e) Four of high specific gravity.

A. (a) Specific gravity is the attraction a substance has towards the earth. (b) It is obtained by comparison and weighing. (c) [No answer.] (d) Benzine, alcohol, chloroform, wood, cork. [He was too smart; he gave one too many.] (e) Croton oil, castor oil, lead, iron. [His experience had been obtained in Ohio.]

A. (a) Specific gravity is the difference from the attraction of the earth and some dry body. (b) By weighing. (c) Making solutions. (d) Glycerin, boric acid, chlorate potash, bismuth. (e) Carbolic acid, morphine, powdered acetate potash. [This candidate was from New York.]

A. (a) Specific gravity is the attraction or weight of a substance as compared with hydrogen. (b) Specific gravity is obtained by suspending a solid in a liquid and comparing the loss of weight with the original. (c) [No answer.] (d) Benzene, water, lithium carbonate. (e) [No answer. This candidate "learned the business" in Illinois.]

A. An element is a product prepared by gentle heat, and is an absorbent of moisture by air.

Missouri.

At one examination a candidate said that beef, iron and wine, and sulphur were antidotes to morphine poisoning.

He "identified" iron sulphate as sugar of milk.

A dose of corrosive mercuric chloride he stated to be 3 grains.

Iowa.

A. Santonin is a powder made from the stomach of the hog.

A. Menthol is a by product of camphor.

A. Gallic acid is taken from galls of animals.

A. All potassium salts are alike in color and can be distinguished by tasting or using them.

A. Ingredients of citrine ointment are citric acid and lard.

A. Ingredients of basilicon ointment are silicon and lard.

Q. Wherein do tinctures differ from spirits?

A. Tinctures are more permanent and spirits do not have a heavy precipitate like tinctures.

Q. Give a description of ergot?

A. It is the milky exudation of claviceps purpurea.

A. Pancreatin is the pancreas of the internal abdomen of the hog.

A. Precipitation is the act of extracting the principle in water and chemically.

A. Precipitation is the gas coming from a liquid, can be prevented by glycerine. [Age twenty-five years, nine years' experience.]

Q. Give a simple test for carbonates?

A. When heated give off a crackling sound. [Age twenty-two years, five years' experience.]

Q. Describe some of the properties of phosphorus?

A. A lustrous metal, dose 1/128 grain, it combines with acids and forms salts.

Q. Why should oils not be used as an antidote to poisoning by phosphorus?

A. It is kept under oil, oil would prevent antidotes acting on it.

Q. Medical properties?

A. Sedative.

Q. Why should it not be administered alone?

A. Because it is a gum and the alkali of the stomach doesn't dissolve it.

Q. What is opium?

A. An alkaloid found in erythroxin.

Q. Scammony, what is it?

A. Stirlingia.

Q. What is understood by a drug having a cumulative effect?

A. One which is adhesive.

Q. Name such a drug commonly prescribed.

A. Rubber.

Q. What are the ingredients of Dover's powder?

A. Aloes, myrrha, sugar milk, myristica.

Q. Medical action?

A. Cathartic.

Q. Describe appearance of following—

Lactic acid? A. A glacial crystalline appearance.

Cochineal? A. A white powder

Thymol. A. A yellowish powder.

South Dakota.

Q. Name two root drugs that are alteratives.

A. Pepsin and pancreatin. [Here is an insight into some students' reasoning: Pepsin and pancreatin are from the hog, the hog roots—and there you are.]

Q. Define and give the source of stearic acid.

A. Stearic acid is an acid obtained from the fat of the "steer."

Q. $\text{Na}_2 + \text{Ca}(\text{OH})_2 = ?$

A. $\text{Na}_2 + \text{Ca}(\text{OH})_2 = \text{H}_2\text{SO}_4 + \text{HNO}_3$.

Q. What are non-crystallizable substances called?

A. Non-crystallizable substances are called resins and gum resins.

California.

Q. What is the natural source of oxalic acid.

A. It has no natural source.

Q. How is oxalic acid prepared artificially?

A. It is not prepared artificially. It is prepared by taking crystals and treating them with acid.

Q. In what form does oxalic acid crystallize?

A. In its normal form.

Q. How is carbon disulphide prepared?

A. By heating wood, and passing the gas into water.

A. By passing CO_2 into air.

Q. Describe the physical properties of carbon disulphide.

A. It has no physical properties, but has a rotten odor.

Q. What is the principal use of carbon disulphide?

A. For passing into water to make soda water.

Q. What is meant by valency?

A. Valency means point at which it boils.

Q. What is meant by a radical?

A. Radical means the part, or how much.

Q. What is an acid.

A. An acid is a salt which has a bitter taste.

Q. Give the chemical name of white vitriol?

A. C. P. sulphuric acid.

Q. Of what is Fehling's solution made, and what is its principal use?

A. Made from iron sulphate. Its used mostly for nervousness.

Q. Define briefly the following terms:

Dimorphous.

A. In state of coma.

Acicular.

A. Having an acid taste.

Prismatic.

A. Having clear.

Hygroscopic.

A. Means nothing whatever.

Lamellar.

A. The same.

Q. What is liver of sulphur?

A. Salts of tartar.

Q. What is methylene blue?

A. Antiseptic tablets.

Q. What are the symptoms of poisoning by strychnine?

A. The eyes bulge and the bowels become stiff.

Q. What are the symptoms of poisoning by morphine?

A. Turn a person rather yellow and num.

Q. What is the best antidote for arsenic poisoning?

A. Flour and water made by mixing the flour and water or by injecting ammonia water, made mixing equal parts of water and ammonia.

Q. What is meant by cumulative poison?

A. Poison now totally eliminated during the injection.

A. Never heard of this kind of poisoning before.

Q. (a) Describe the physical properties of chlorine? (b) Give the density of chlorine, and name an important acid into which it enters?

A. (a) Chlorine is a gas of yellowish color. (b) Chlorine is a thick liquid. [Given by the same candidate.]

Q. What is the difference between adhesion and cohesion?

A. Adhesion the molecules simply adhere, sticky or stick together. Cohesion the molecules get together and stick.

Q. Why should granular effervescent salts be kept in well corked containers?

A. To prevent the strength from losing it.

Q. How does bromine occur in nature, and how obtained?

A. In white tasteless powder.

Q. What is the principal use of phosphorus?

A. As an excipient in pills.

Q. (a) Define *hora somni*. (b) *pro re nata*.

A. (a) A tablespoonful in a horizontal position. (b) Let it be made according to law.

Q. Explain the reaction which takes place in the manufacture of citrine ointment?

A. When used with an iron spatula becomes oxidized and turns black.

Name of State Withheld.

Q. (a) What is an expectorant. (b) Name a medicine used as such.

A. (a) An expectorant is a medicine used in female trouble. (b) Example, Jane's expectorant.

Q. Give the Latin name for white oak bark.

A. *Alberis barcti*.

Q. Give official name, family, and habitat of burdock.

A. Burdock, family, buckwheat, name, rheum. Habitat U. S. and France, a cathartic $\frac{1}{2}$ fluid dram. Due to the cathartic acid.

Q. What is *adeps lanæ hydrosus*?

A. Hydrous wool fat from the interior glands of the sheep.

A. It is a fat taken from the stomach of the hog.

Maybe we write letters which are just as ridiculous as the answers given by some candidates for board license; it is not for us to say; but here are the views of a man who has seen specimens of both, and was requested in one to furnish some examples of the other:

An examiner, who has been on the job for years just passes up any little fool answer, and as a usual thing passes up fool questions the same way. Of course, if your editor on this particular subject has an obsession that he must have these, and that they are real interesting to your readers, why, that is his business, and far be it from me to butt in, as I never edited any drug journal, and I like a joke as well as anybody (and that is probably why I answered the letter). But when a fellow is on several committees for the State Association, and is asked a whole lot of more important and business questions, why, this one don't seem to be very essential.

As a sort of offset to this; that is to say, in order at least to pull some board members down to our level, we quote from the letter of an old-time examiner:

Fool questions oftentimes lead to or suggest wise answers, and my experience as well as observation strengthen my suspicion that even board members are not always beyond the pale of foolishness or exempt from committing ridiculous blunders.

One examiner who contributes to this "symposium" writes that he would like to give examples of perfect answers also.

Another writes:

During my service as examiner for the past ten years we have had many amusing answers to questions propounded by us, and while many of them were ludicrous in the extreme, I have often had a feeling that it was partly our fault in that we did not ask the questions right, to get the answers we hoped for.

From a board member in the Far West:

There are certainly many interesting and ridiculous answers given by the students at the board of pharmacy examinations, and if I had one-half of the funny things filed that have happened during my nearly ten years' experience as an examiner, I could almost write a book; but as you know, in a busy every-day life we have only to laugh and pass on to the next.

Even some of the letters that one receives from the would-be druggists are funny enough for *Puck* or *Judge*. Any way, it seems to me that such an article as you propose will do no harm, and it will no doubt do many of us a lot of good.

Not so far from home a board member, in reply to our request for data, wrote a letter from which we quote at some length:

I almost am afraid to comply with this request, and were it not for the fact that it is being made by a journal which I hold in high esteem, I should decline to respond.

Some years ago, perhaps eight or ten or even more, I had the temerity to write an article dealing with this same question, supplemented with numerous horrible examples, which articles, or rather paper, I read before one of the local societies. Much to my surprise I was hauled over the coals "good and plenty" by some of my friends of the pharmaceutical press. I took the lesson to heart and since that time I have stood in mortal fear and terror of this question and have avoided touching upon it, except in the sanctity of the class-room or laboratory, and even there with a faint heart. I am, however, much encouraged by your request and will try to pluck up enough courage to respond, hoping that the gods will spare me, and that I shall not this time be atomized, pulverized and utterly annihilated.

At the outset allow me to say that the best time for the propagation and ripening of "gems" of this type has passed and gone. With the increased requirements for admission and graduation from colleges in this State, a better class of men and women have come on deck, and ridiculous answers are now very much the exception.

I am sending you these questions and answers with the understanding that you will be responsible for whatever may happen in connection with their publication, to me, my executors, heirs and assigns. If you are still willing to take the risk, go ahead at your peril.

At one time I had enough of this material on hand to fill a book, even a good-sized one, but after the experience above alluded to, in the darkness of night I consigned every scrap of it to the depths of the ocean, properly weighted, lest it should come back and haunt me, so that I now have only my memory to rely upon.

A New England brother favors us with a few observations and one somewhat peculiar answer. He writes:

It is with regret that we have such replies at nearly every examination. This board has been severely criticised for the small percentage to whom it issues certificates, but I believe if the druggists in this State could see some of the answers that we receive at every examination they would perhaps lay some of the blame upon the candidates rather than the examiners.

I believe the reply to one question in oral examination that I asked of a Frenchman struck me as being the most comical one I ever received, although it was correct and showed that the candidate was thoroughly conversant with the subject. I said to him: "Now, knowing that water and oils are not miscible, how do you explain that linseed oil and lime water, used in making carron oil, are miscible?" His answer was: "Vy—dose alkali in ze lime water, she make soap into it."

An examiner who supplied some of the queer answers herein quoted, takes a slap at the professors. He says:

I know that many teachers have a contempt for examinations, but as we have no other means of ascertaining how much, if any, knowledge was absorbed from the instruction given we will consider that a good examination carefully conducted, at least weeds out the grossly incompetent.

Experience as a board member teaches a few things not learned at other schools. A man who has had some of this kind of experience writes:

The first set of examination papers I helped to mark was a revelation to me. How these boys, who are all college graduates, manage to pass their college "exams" is a mystery too deep for me to fathom. . . . I have not a very good opinion of our colleges. I believe they are money-making institutions and care nothing about the kind of men they turn out. I further believe that 90 per cent. of the men who enter college have not sufficient preparatory education and the first and greatest wrong is committed in permitting them to enter.

It is our intention to give further answers tending to throw a light on the workings of board candidates' minds in a subsequent issue, and if any board member or ex-board member has any to contribute we should be glad to hear from him.

DRUG STORE ADVERTISING

By M. P. GOULD, of New York

In this department some of the fundamentals of successful drug store advertising will be expounded each month. The aim is to correct errors of advertising and establish the most profitable and advisable methods of building up retail drug trade by means of the powerful influence of advertising.

A Study of Retail Advertising.

During a recent trip to Kansas I was invited by the Commercial Club of Topeka to address the retail merchants of that city on the subject of advertising. What I said was practically impromptu, because I had only half a day to think the matter over before the address was given; but those who attended the meeting seemed to be so interested in what I said, and so complimentary regarding it, that I have come to the conclusion that if I said the same things to the readers of THE DRUGGISTS CIRCULAR, they also may be interested in it.

I made the statement in my address that on that morning I had picked up the Topeka papers and had run my eyes over the advertisements printed in those papers, with the result that I was struck by the dullness and uninteresting character of the copy. I have made this experiment many times. The advertisements in the Topeka papers are above the average. They are brighter and more clever and interesting than the newspaper advertisements in many parts of the country. The fact is that if one will make a study of the advertisements in newspapers in his town, or any other town, he will be impressed by the poor attempt at interest-awakening in the wording.

When I made this statement, one of the men in the audience—whom I had invited to ask questions at any time—remarked that he had heard other men say that newspaper advertising was dull, but that he had not seen anyone yet who had the nerve to point out the dull part and attempt to make it more interesting. I immediately called for a paper and asked if he had an advertisement in that paper. It happened that he was a banker, and that he did have an advertisement in that issue. Of course, everybody was very much pleased, because it looked as if something interesting was going to happen right then and there. His advertisement was very well set-up in a 3-inch double column space with plenty of white margin around the edge, and worded about like this: "National Bank; Checking, Trust and Savings Departments." I read those out to the crowd, and then I asked: "Well, what of it?" and everybody roared. In other words, what if he has those three departments? Who cares? The mere fact that you can put your money in that bank and draw it out was not sufficient to draw depositors to that bank, or sufficient to warrant the expenditure of money in saying such a commonplace thing.

The banker then said to me: "How would you change it?" And the crowd laughed again because they thought it was on me that time. But I said, "Well, now, let me follow the procedure that is usual in such matters with me, and let me ask you some questions." "Do you pay interest on deposits?" I asked. "Yes; 3 per cent," answered the banker. "Well, why don't you say that?" I replied. "Isn't that the interesting fact? Isn't it more interesting to the public to know that they can get 3 per cent. on deposits in your bank, than merely to know that they can put their money in and check it out? Does not anyone know that he can do that much in almost any kind of a bank? What is the use of wasting money and abusing the intelligence of the public to say something that everybody knows?"

Then the banker replied: "Everybody around here

Spring House Painting

WHEN all the world seems to change from the dullness of winter to the brightness of summer, then is a good time to change the aspect of the house and put a little brightness into it. Paint it. Put new, live colors on it that will not only improve its appearance, but will also preserve the wood. The purity and quality sort is the class of house paints we recommend, and we have them in forty colors and tints.

Harmonizing Interiors

INSIDE paints, varnishes, finishes and wall coverings. It is not merely a question of what to use to produce the handsomest results in paint effects alone; your interior decorations should harmonize with the furnishings. So you want our paints and finishes and our help in selecting colors and combinations. Wall papers, too—all the best and newest designs and colors for side-wall, ceiling and panels. Prices of all goods right.

(Name and address)

knows that all the banks pay 3 per cent." "That," I replied, "is very doubtful to my mind. I do not mean to question your word, but I think that not everybody knows that all the banks pay 3 per cent." Then I asked: "How does your chief competitor advertise?" And he replied: "He advertises that his bank pays 3 per cent. on deposits." "Then he's got you skinned," said I. And the crowd roared again.

The lesson to be drawn from this heckling is that in an advertisement you should say something definite, something that is worth saying, and that will be interesting to the man who reads it. That brings me up to the first point which I made in the Topeka address, and to which many of the audience in talking with me afterwards referred specifically. This is an appeal to the self-interest of the reader.

There are so many advertisers who are thinking only of themselves. They sit down at their desk and they think of the goods they have to sell. They become so interested in describing those goods, and they think so much about the money that they want to get from the sale of those goods, that they do not take into consideration what the reader of that advertisement may be thinking about. Every advertisement which appeals to the self-interest of the reader has won its first victory. It gets the attention of that reader because he can see in that advertisement something that will be of benefit to himself.

In the Topeka address another point came out which interested the retail merchants there who are advertisers. A household furnishing merchant asked me to criticise his advertising. After glancing at a specimen I said: "It is a fine advertisement, but you did not prepare it." Then everybody laughed at him, but he admitted that he did not prepare it, but that the advertisement was furnished by the manufacturers of the goods featured. The advertisement was announcing a week's demonstration at this man's store. It told of an experiment that could be made with two classes of cooking utensils, showing which was the better by the time that it took for the heat to travel to the handle. I went on to explain why that was a good advertisement. "The reason why," I said, "is that this advertisement is full of news value. It tells the women of Topeka something which they will be interested in reading about, and interested in coming to the store to see. It describes something that is happening. It is not merely made up of a string of words describing something that has no action to it."

The lesson to be drawn from this is that the more action there is in the story, the more interesting the advertising will be. The lazy advertiser who simply sits down to his desk and writes a lot of words about goods in his store is not usually a good advertiser, unless he is a genius in writing—in which case he usually is not a good business man.

A third man wanted to know if I believed in bill board advertising. I immediately asked him why he asked me that question; because I had a feeling that that question did not call for a direct answer. It turned out that this man was not a merchant at all, but a representative of the bill-board exploiters of that town, and that he was trying to get my endorsement of bill-board advertising for his own use. Consequently, when he asked me the question and I answered him as I did, the laugh was on him. And that leads me to moralize again. When any man goes to you with an advertising proposition, study the proposition for its own value, and also find out the connection that the man presenting it has with the proposition, so as to ascertain whether he is prejudiced or independent.

A fourth man wanted to know whether I considered it wiser to advertise when business was dull, or when business was good. I replied that the best time to advertise was when business was good. I explained this by pointing out that there were many lines of merchandise which have seasons, and that it was wasting money to advertise those goods out of season. Consequently, if a person advertised those goods during the dull season to get results he would have to spend three or four times as much money as he would if he got the trade on the incoming tide. Furthermore, when a store has a lack of business, and cannot make the trade respond to its advertising—to some extent at least—the fault too often is with the store, and not with the advertising. Frequently a retailer goes along in a rut, using the same old place, with the same old copy, in the same old paper, advertising the same old goods, until the whole proposition becomes so stale that nobody but

the paper and himself would know if the advertising was omitted. Such a retailer needs to "shake himself" and go off for a trip and look over other stores, until he gets a new point of view and becomes ambitious to make his own store better and bigger, and then come home and do things in his own store. Then his advertising will bring far better returns.

After the address was over, this man came up to me and said: "I am a grocer. Most of the groceries are bought on Saturday. We have about all the trade that we can wait on on Saturday, without advertising. Nevertheless, we have found it far more profitable to hire extra clerks to work on Saturday only, because if we put an advertisement in on Thursday or Friday for Saturday's trade, the people will respond to it very quickly and liberally and we can crowd the store, but if we put the same advertisement in on Monday we will get very little response for it in Tuesday's trade."

This is true of department stores as well. In buying space throughout the United States in all kinds of newspapers, I have discovered this fact: The department stores generally use so much space in the Friday issue because there are so many more goods bought on Saturday than on other days that I have to pay an extra price to get a good position for an advertisement in Friday's paper. That is the best evidence that department stores are firm believers in striking while the iron is hot; advertising while trade is coming.

Another man asked me if I believed in blotter advertising. "Certainly I do," I replied, "provided you use those blotters in a way that does you good, and provided that blotter advertising is not of a score of different ways of scattering your advertising appropriation; because I believe in concentrated advertising." A great deal of money is wasted in advertising in too many different ways. To spread a drop of syrup over a slice of bread, is to spoil the bread without imparting a taste of syrup. Concentration is one of the discoveries of the day in the realms of advertising.

I trust that this lesson will be as interesting to the readers as it was to the merchants who attended the meeting. I should be glad to go through the same kind of a heckling by letter if any subscriber cares to ask questions about his advertising.

According to an opinion of the attorney-general of Illinois, boards which collect fees and expend money in the State are working under a law which is unconstitutional.

March— Winds— Chaps—

CHAPPED, red, rough, cracked and inflamed skin is usually the result of exposure to the March winds. Such unpleasant conditions may not be entirely preventable, but they can be made less annoying. Perhaps we can help you, we have lotions, creams, powders and other preparations for the relief of all wintry skins, and to keep your complexion perfect in all kinds of weather

(Name and Address)

FOUNTAIN AND FREEZER.

Fancies, Facts and Formulas.

Secret formulas at the soda fountain are rare; this every dispenser knows. It is not formulas but quality and service that are the true secrets of success in the business. Soda water being essentially a luxury, the public demands better service and greater return for its money than would be the case if the beverage were a necessity.

QUALITY MORE DESIRABLE THAN QUANTITY.

The foundation of a paying soda business must be laid not so much in quantity as in quality. Soda water being a luxury, the desire for it must be created, and to this end the drinks must be tempting and the service the very best.

Economy, while a laudable quality ordinarily, is deplorable when practiced at the fountain in an endeavor to make one gallon of syrup do the work of two. A customer has been known many times to ask, "Why can't I get a drink like this at Blank's?" The dispenser knows the reason and it is no secret. It is because Blank practices false economy. Not only must good syrup and plenty of it be used, but soda water to "take" must be cold; the water must be highly charged with a good quality of gas; if plain cream is used (and it should be in all cream drinks, whether ice cream is added or not) it should be cream, not milk, perfectly sweet and cold. These things are absolutely necessary if the fountain is to be raised out of the commonplace.

POINTS WHICH MAKE FOR SUCCESS.

Among other points which figure largely in success at the fountain are the manner and appearance of the dispenser; absolute cleanliness about the fountain; thin glasses and clean ones. A well-made drink served with a tarnished spoon and in a discolored bent holder is labor lost. A soiled coat; fingers yellowed from the use of cigarettes, or with mourning bands at their extremities; an unshaven face; too much familiarity with the customer who is being served, or with friends around the fountain while serving a stranger, are among the things which a successful dispenser must avoid as he would the plague; for people, even those ordinarily rather unobservant, are almost sure to notice such shortcomings on his part. Cut flowers add greatly to the inviting appearance of any fountain; and a printed or typewritten menu, changed frequently, pleases many patrons.

THAT OLD ENEMY, THE FLY.

With the advent of warm weather the troublesome fly must be reckoned with. The electric fan is by far the best fly chasing contrivance. However, where a fan is not available or practicable, equal parts of oil of cedar and water, while not miscible, may be used with fair results. This mixture should be kept in a bottle with a sprinkler-top and be well shaken before use. A few drops shaken out here and there and wiped off with a damp cloth, leave an odor which, while not at all unpleasant, has been found partially to rid the fountain of flies.

There are a certain few drinks at the fountain that always will lead in popularity, yet the judicious use of some attractive names even when applied to old combinations will serve to catch the eye and arouse the curiosity of the customer.

LAUNCHING A SPECIALTY.

A certain druggist once hung a card, very neatly printed, near his fountain. The card read in large letters, "Don't turn me over." Some asked questions, a few were afraid of a joke, but a great many more turned the card over and read—

.....
: TRY A GOLDEN FLIP. :
: Adult size 15c. Children's size 10c. :
:
:

The question was asked "What is a 'golden flip'?" and the dispenser assured the customers—in this instance, college students—that it was a scientific combination, the result of many experiments. Did the drink sell? It surely did. At the end of a week more than two hundred had turned the card over and more than half of this number had tried the subtle combination. In a month the golden flip was an established beverage among the students, and competitors sought the formula and imitated it. Golden flip kept its popularity one whole season, and by that time there was another novelty to take its place. Golden flip had no

secret formula; its catchy name, the advertising it received, and its newness made it go. Here is the formula:

Golden Flip.

Chocolate-maple syrup.....	enough.
Malted milk.....	1 teaspoonful.
Milk	enough to shake.
Cracked ice.....	enough.
Water from the fine stream.....	14 ounces.

Draw the required amount of syrup, add the malted milk and ice, and a few ounces of milk. Shake well and fill the glass with the fine stream.

Chocolate-maple syrup consists of equal parts of chocolate syrup and pure maple syrup.

Golden Flip Cluck.

Make as above, with the addition of an egg.

Polar Flip.

This is a golden flip with ice cream in it.

Millionaire.

This is a combination of the golden flip, the egg, and the ice cream. It may seem quite formidable to the average soda drinker, but has no terrors for the usual run of college students.

Commissions to Stimulate Sales, and Other Trade-Helping Ideas.

Under the supervision of Frank E. Mintzer, in charge of the spacious fountain in the store at Twelfth and Chestnut streets, Philadelphia, there has been perfected a system of stimulating prompt and efficient service that has proved to be a big money-saver as well. Every member of the dispensing staff in addition to her salary—for all the dispensers are girls—at the end of the week receives a percentage of her receipts. The commissions are fixed and every girl knows that if her sales for the week reach a certain figure, say \$100, she will receive perhaps 5 per cent. on the increase over the minimum, which, for example, we will say is \$75. Should her sales exceed \$100, it may be that the commission will amount to 7 per cent. of the increase over \$100. Every dispenser deposits a slip in the cash register when she rings up her sale, and this slip contains the amount of her sale and her number, so it is an easy matter at the end of the week to total each individual's sales and estimate the extra commissions to which she is entitled.

The value of the system has been demonstrated in more prompt and efficient service, which has made it possible to reduce the working force to those who have demonstrated exceptional ability to dispense soda. Under this plan the employer readily tells just which dispensers are the drones; and customers are waited on with exceptional celerity, for each dispenser, who has her allotted space, not only wishes to wait on her customers quickly but wishes so to impress them that on their next visit they will give her another chance.

Mr. Mintzer has literally "hitched his wagon to a star" by taking advantage of the profuse advertising that greets the arrival of a theatrical celebrity in some popular production, and naming a new drink for the actor or actress in question. Whenever possible, he secures from the press agent of the star, a picture of the latter and has it copied for use on one or more display cards about the fountain or the window.

One of his recent creations along this line was the "Catharine McDonald Sundae," named for a well known actress who was a headliner at one of the leading theatres less than a block away. In addition to the name of the drink, neatly lettered signs about the store contained an attractive picture of the actress. Mr. Mintzer was just as original in making the sundae, and this is how he did it:

Catharine McDonald Sundae.

Cut an orange in two, take out the interior and crush it to a pulp; add shredded coconut and enough orange syrup to sweeten, and place in the lower half of the orange rind. Top with orange ice, replace the upper half of the rind, and serve. Collect 15 cents.

Virginia Marlowe, Olga Nethersole, Willie Collier and many others have helped with their names to give originality and popularity to Mr. Mintzer's inventions along these lines, and many little expressions of approval, both verbal and written, has he received in addition to the pictures which in many cases have been autographed by the originals who rarely fail to stop in at the fountain for the purpose of enjoying a drink named for them.

Good Soda Sells All the Year 'Round.

By A. O. GINTHER.

The soda water business has been closely identified with the drug store for so many years that fountains in other places are looked upon as more or less of an innovation. However, it is a lamentable fact that many druggists who have spent money to place fountains in their stores, feel that the transaction is complete, and, in many instances, complain that there is "no profit in soda water." Business goes only where it is invited, and it is no more reasonable to expect the soda water department to be on a paying basis without attention, than any other. It is a positive fact that if the druggist were to put as much effort behind his fountain as he does behind the small-profit sale of "patents," the result would be most gratifying.

The cardinal points are quality, cleanliness, uniformity, new ideas, and untiring effort to please. The review of the business for the last five years shows a wonderful increase, especially in the last two years, which is entirely due to the proper display of the goods offered for sale. Soda selling is a "luxury business," and it is only reasonable to claim that the more attractive the display, the larger the receipts. An attractive fountain, containing the sanitary features of modern construction, invites patronage. Cleanly clad dispensers, active, alive to the individual taste of the customers, create an indelible impression. Let the fountain be made a point of interest to the locality. "To-day's Special" should be a feature, and changed daily; the naming of drinks for those prominent in current events is a valuable point.

Let the druggist set apart a day, properly advertised, when a glass of soda water will be given with every purchase of a certain amount. This will bring many new customers to the store and at the same time acquaint them with the goodness of the service. Then he might set apart a day upon which the receipts of the fountain, less the actual cost of materials used, will be given to a church, lodge or some special charity, having no fixed price for the drinks served. This will prove a better advertisement than could be obtained through the old channel of circulars or local papers. The writer has knowledge of this plan netting the beneficiary over \$200 in a town of 3,000, as well as bringing new customers that very materially increased the druggist's year's total business. If there is a determined effort, the result will surely come. Some will say that this does not apply to the neighborhood store. It does. W. E. Sanders, Twelfth and Vine streets, Philadelphia, opened his fountain late in May, closing it always by October 1st, with a total season's business of \$260. After reasoning, he consented to put into practice the plan just mentioned, and his next season showed an increase of \$400. The second season, with his fountain running twelve months in the year, found his receipts \$1,230. So it is wholly up to the man behind the counter.

The general trade outlook for the coming year indicates a record-breaking season. The vast number of orders placed for new apparatus alone show that the dispensers are keenly alive to the possibilities and are grasping the opportunity, so it will behoove every dispenser to enter the season with the determination to have his share of the business instead of letting it go to the "man across the way." Every dispenser should make his customers feel that his service is as good as he knows it is. He should keep his fountain open the year 'round, as a customer who goes to another store for soda water will soon go there for everything else. He should not refuse to be convinced without one season's honest, earnest effort, and the result will please him so much that the effort will become a habit. Each druggist should resolve that he can do what others all around him are doing, and that he is not doing himself justice without using his utmost endeavor to make the return on his investment reach the maximum. The public wants soda water twelve months in the year, and will buy it from the man who invites business and treats it well when it comes.

The cashier or the clerk who receives the money should exercise care in handling change; dimes and "nickels" covered with syrup or even wet with water are distasteful to the customer.

Small details, and the attention which they receive, constitute the difference between a fountain-service that merely attracts casual customers and one which makes "repeaters" of those customers.

The Fountain as an Investment.

By C. C. WHITE.

One often hears a druggist say, "If I only had the room that fountain occupies."

Nine chances in ten the apparatus referred to is an old wall-box, in style "when father was a boy," presided over by any of the clerks who happens to be at leisure when an occasional customer drops in.

Not only are these old-style fountains left to take care of themselves, but a great many business (?) men every year accede to the popular demand and install a new "ice-less," front-service apparatus, but allow it to be run in the same old slipshod manner.

Now, the finest fountain ever built will not get the business unless some one with brains has charge of it. The day when a fifteen-year-old boy could manage a fountain is over. Just as surely as the march of time has made possible the wireless telegram and the aeroplane, just so surely must the business man change from the ways of his grandfather.

Millions are made each year in "nickels" and dimes, and when a man invests anywhere from \$1,200 to \$5,000 in apparatus and then puts it in charge of some youngster, good night to the investment!

The average department store fountain is a success. Why? Because the department store is an institution of today, with new principles and new methods, and with a first-class man at the head of each department, including the soda water department. The store manager will not take the first man who offers himself for the position of fountain chief, but is as careful in his selection as if he were choosing the manager of the biggest-paying department in the establishment. Therefore, at the head of the fountain in a department store, one usually finds a man with "get-up," ideas, originality, and, above all, years of experience. In other words, one who has worked and can make others work, while still retaining their friendship. Naturally to have acquired this experience such a man has been in the business several years, therefore is past his teens and will be looked up to by the employees under him.

A fountain manager should be allowed to hire his own help and buy his supplies, and be trusted with all the details of his department; he is at all times in close touch with the supply houses, and this mark of confidence gives him prestige with his assistants.

All supplies should be of the best obtainable. Ice cream, the most important of all stock, should be purchased from the concern recognized as the leader in its line. As a rule, the big ice cream companies have acquired their prestige through a high-grade article, well advertised, and a card conspicuously displayed to the effect that a fountain uses Blank ice cream will tend to couple the name of the fountain with the reputation and advertising of Blank.

Some of the wide-awake men are running their places along these lines, but the majority are not. From a financial standpoint there is as much reason for having an experienced man behind the soda counter as a registered drug clerk in the prescription department, and it is dollars to doughnuts that with a decent location and the right man behind the modern fountain, it won't be long before the soda receipts will make the prescription man a bit envious. The fountain is no longer a toy, and the old adage, "What is worth doing at all is worth doing well" applies to the soda business.

Where Quantity Counts.

In one of the smaller cities of Ohio a druggist reports that the Greek confectioners have almost run the drug stores out of the soda water business, although, he says, he notices that when anyone invites a stranger in town to have a glass of soda, he takes him into a drug store. The explanation is that the Greek gives quantity while the druggist strives for quality. This seems to negative much of the advice one reads in the journals, that the public demands quality rather than quantity.

After all, it depends much upon the quality of the people who drink the soda water—a large glass of sloppy stuff, cold and sweet, for 5 cents appeals to many, but there are many others who could not be paid to drink this kind of soda water but could be trained to patronize a high-class modern fountain if properly worked upon. And when the druggist gets these people coming to his fountain, many of the other kind will follow.

A Pittsburg Chain of Fountains.

Under the management of George W. Hughes, the May Drug Company conducts seven fountains at Pittsburg, Mr. Hughes, who is favorably known in high-grade fountain circles in this city, says that in order to maintain a high and uniform standard for his company's soda supplies, all syrups, ice cream, etc., are made in a central laboratory.

The seven fountains are subjected to a daily inspection, and cleanliness in every detail is insisted upon.

Having high-grade goods and cleanliness about the fountains, the next requirement is politeness on the part of the attendants. Upon these three things, to a great extent, at least, believes Mr. Hughes, success depends.

Continuing, this head dispenser says: "We have quite a long list of fancy drinks, ices, and creams, which vary in popularity and demand according to the location of the fountain. Our standby, as is the case with many other dealers, is chocolate, and to the manufacture of chocolate syrup I have given a good deal of thought and attention. The following formula increased our business in chocolate soda 100 per cent. the first year we used it:

Chocolate Syrup.

Cocoa	8 pounds.
Sugar	50 pounds.
Salt	1 teaspoonful.
Extract of vanilla.....	4 ounces.
Water	6 gallons.

"Make a paste of the cocoa with a portion of the water, then add the balance of the water in which the salt has been dissolved; bring to a boil, add the sugar, and again bring to a boil. When the syrup is cold, add the extract of vanilla.

"The result is 10 gallons of good chocolate syrup, provided good cocoa is used—and a really good article of cocoa is not inexpensive, although I have always found it cheap. This syrup dispensed with plain cream or ice cream makes a very evenly balanced drink."

Mr. Hughes contributes a formula for another concoction which he says is a "winner, especially between seasons." It follows:

Bisque Pudding.

Egg	1 only.
Cream (30%).....	1 quart.
Almond paste.....	4 ounces.
Powdered sugar.....	3 ounces.
Extract of vanilla.....	a few drops.

Mix the almond paste with enough of the cream to produce a thin, smooth paste; then add the sugar, the egg, and the extract of vanilla; rub all together until smooth, add the balance of the cream, and whip until stiff (just as cream is whipped). Put in individual paper cups; sprinkle with ground burnt almonds; and freeze in an ordinary freezer.

These, he says, can be made in as small a quantity as desired, are easy to make and keep, and sell well at 15 cents each—although there is profit in them at a dime.

Fancy Drinks Under Difficulties.

Perhaps it would be just as well not to mention the name of the clerk who writes the following, as it might bring him into disfavor with "the boss":

"For the last three years I have been employed by druggists who have fountains to which they fail to give the proper attention. Furthermore, they do not permit anyone else to give them this kind of attention. My present employer is what might be termed a conservative in matters pertaining to the soda water art, and allows one of his best assets to lie almost idle. I have tried to serve some of the fancy beverages and dishes I have read about in the journals, but he doesn't seem to favor the idea, so I have learned not to bother, except when some of my special friends come in. On such occasions I have made a hit with the following, which is not original with me:

Banana Canoe.

"Peel a banana and split it in two lengthwise; place the two halves side by side on a long narrow dish, and across these, to represent seats in a boat, place two long, thin wafers; near each wafer drop a ladleful of ice cream, and cap each with a cherry.

"For this charge 15 cents."

Here are a few blends for phosphates: grape and orange syrup; cherry and pineapple; grape juice and sliced oranges.

For the "Front Page."

Of all the "preferred positions" in the drug-store advertising world the show window is the gilt-embossed, four-color, front-cover page of the "deluxiest" brochure de luxe—and it can be had in "every issue" at a very low figure. But, in the name of Mercury, famed for his variety of aspects, do not use the same "copy" the year 'round. Just for luck try this set-up for the middle of March:

Cover the window floor with an undulating layer of sawdust dyed to a dead-grass-brown color, with here and there a touch of early spring greenness, and a few traces of snow in the hollows. Sinuously crossing one corner of the landscape let there be a mirror "streamlet" with an edging of magnesium sulphate ice. From lower left to upper right trace out a highway with wet sand, having the road cross the stream on a rustic bridge. Somewhere in the distance plant a solitary gray leafless tree. About two-thirds the way up the road set up a doll-house with a tie rail and horse block before it. Let there swing out from a post before the door a tavern sign designating that 'tis the "Bubbling Urn" that stands by the high-road proffering rest and refreshment to man or beast. A coach and four and a few equestrians upon the road will add to the picturesqueness. Hang on the side wall and as a background a cloth painted with a mixture of acacia, water, chalk, and pigment in the washed-out-blue color of the March sky, flecking the firmament with streaks of gray cloud to enhance the effect of bleakness. Tell to the passer-by, on properly placed placards a few things like these:

March becomes May after a cup of
our hot soda.

At the Sign of the Bubbling Urn
chilliness takes flight.

The breath of the March lion is
tempered by our soda.

Properly made, a display of this kind ought to draw customers to a hot fountain—enough of them to pay for taking pains with the display.

Driving Them Away.

Baltimore Bowlers Drink Soda.

Well within the memory of present-day bowlers, gymnasts and athletes, generally a bowling alley or gymnasium was considered incomplete without an annex for the sale of more or less alcoholic beverages. Of late years, however, a great change has come over the situation, and it is easy to foresee the time when bowling alleys and bar rooms will be entirely divorced. A sweeping modification of views with respect to sports and drinking has taken place, and it is now generally recognized that the competitor in a game of any kind is seriously handicapped when he proceeds to fortify himself with a "bracer."

A BOWLING ALLEY FOUNTAIN.

There are far more bowling alleys in Baltimore to be counted among the total abstinence resorts than are connected with saloons, and the prevailing sentiment now is that the use of alcohol is not only valueless but decidedly detrimental in competitions of physical dexterity or strength. The combination now frequently encountered is a bowling alley and a soda fountain. At one of the most extensively patronized bowling alleys in the Monumental City, where a score or more teams bowl at one time, there is a fountain, which, while rather plain in appearance, is attractive. The chief dispenser at this place is a young man with a fondness for the work, who has made a careful study of the business, with whom the mixing of beverages is an exact science. His knowledge insures uniformity and just the right flavor or touch, to the drinks that he turns out, and is also conducive to the development of novelties.

WHAT BOWLERS DRINK.

The experience of this dispenser, however, is that the great majority of patrons of bowling alleys are rather indifferent to novelties. They cultivate a taste for some familiar beverages and then stick to them, seldom varying the call. As might be expected, so-called "tonics" are very popular with the bowlers, who demand no fancy frills, preferring to be quickly served.

Next in order come the egg drinks. These drinks do not depart from the ordinary run of such conceits, the mixtures used being in the main those which experience has shown to be easily compounded, and which unite food value with an agreeable flavor. The management does not find it difficult to get 15 cents for these egg drinks, which are prepared with malted milk, with soda water, and in a variety of other combinations.

Next to the "tonics" and egg drinks, the masculine fancy runs to chocolate, plain and with cream, hot or cold. Perhaps no other flavor enjoys such general popularity as chocolate, drinks into which it enters having quality that makes them acceptable to all kinds and conditions of patrons. And in this connection it may be noted that chocolate with ice cream is relished in winter not less than hot chocolate. Every soda water dispenser in Baltimore will probably bear testimony to the correctness of the statement that while the demand for hot drinks in winter is undoubtedly on the increase, the gains in the calls for cold drinks are proportionately greater. It seems a contradiction to assert that the devotees of bowling and other pastimes are addicted to cold drinks, but such is the case, and the observation can be verified even in ice-skating rinks, where the surroundings would naturally seem to encourage a desire for something warm. Singularly enough, the requests for coffee are not so numerous as might be supposed. Apparently, coffee is a thing that everyone unconsciously connects with eating and drinking at home, so that when anywhere else the desire for something different instinctively asserts itself.

THE DISPENSER AS A PSYCHOLOGIST.

The resourceful and intelligent dispenser, of course, makes a careful study of the preferences of his customers. He must have a real love for the business if he is to be conspicuously or even modestly successful. It will not do, says the manager of the large bowling alley, merely to put a young man at the fountain and tell him to draw glasses of soda as requested, but the very manner in which he does it increases his value or detracts therefrom. The dispenser must be, in a way, a student of human nature, to be able, if the bulk of the custom be among men, to enter into a man's feelings, and without seeming to do so, suggest to the caller in numerous instances what he wants. To be sure, some patrons are quick to resent anything that can be even remotely construed as savoring of tutelage, but a large proportion of drinkers are grateful for a hint which

relieves them of the trouble of choosing between a variety of concoctions.

AS TO FRESH EGGS, AND THE OTHER KIND.

It goes without saying, of course, that the materials must be good, the surroundings inviting and the processes above suspicion. It is the unvarying practice of some dispensers to break each egg used in full sight of their customer. This inspires confidence in the quality of the soda generally, and in the egg especially. It will not do to pin soda fountain reputations to storage eggs, but the "fruit of the hen" must be gathered in the poultry yard and transferred to the fountain without undue delay. The price of such eggs will be somewhat higher than that of others, but a dispenser with a valuable trade will unhesitatingly conclude—to say nothing of the flavor—that assurance is worth the difference.

The dispenser at the bowling alley, being somewhat in a reminiscent mood, said: "When I am off I sometimes go around to other places and see how they do things. One day I happened to go into a drug store and call for an egg drink, and the man behind the counter broke not less than four eggs before he struck a good one. What do you suppose was my impression of that place, and with what emotions did I imbibe the drink? Such an experience is enough to kill all further relish for egg drinks, or any other, for that matter, in that particular place."

S O D A

JUST as good in March
as any other time—the
luscious, pleasing soda
drinks that you have always
fancied. The purest fruit
juices, the snappiest car-
bonated water, mixed and
served right. Ice cream
sundaes, ice cream soda. If
thoughts of cold soda make
you shiver, we have de-
licious hot soda: Chocolate,
bouillons, and many fancy
conceits. All pure, piping
hot, mightily pleasing cold-
day drinks.

(Name and address)

Some More Federal Allegations of Sophistications.

Since the publication of the list of notices of judgment under the food and drugs act of June 30th, 1906, in last month's CIRCULAR, page 100, the following of possible interest to druggists have been issued by the federal authorities:

Olive Oil.—George P. Calogera, of this city, shipped in interstate commerce a quantity of a food product labeled "Extra Superfine Olive Oil. Mannis Olive Oil. Imported and packed by G. P. Calogera, N. Y., U. S. A." Samples analyzed by the government chemists were reported to be adulterated with cottonseed oil. A libel was filed in the United States court for the northern district of Georgia wherein it was alleged that the product was adulterated and misbranded. No answers having been received to the allegations and no claims being made to the goods, they were declared forfeited to the United States and sold at public auction.

A. Fiore, doing business as A. Fiore & Co., of this city, shipped in interstate commerce a food product labeled "Olio Sopraffino, Stella Brand Olive Oil and Salad Oil—A Blend. Stella Brand Olio. The contents of this can comprise a compound of olive oil and a specially refined product of salad oil pressed from cottonseed, canned in conformity with the Pure Food Law of the United States. Sopraffino." Samples were analyzed by the bureau of chemistry and the result was that proceedings were instituted in the United States court for the southern district of New York alleging that the product was misbranded in that the label would tend to deceive the purchaser into thinking that the product was Italian olive oil, whereas it contained 75 per cent. of cottonseed oil. The defendant entered a plea of guilty and a fine of \$10 was imposed by the court.

A quantity of a product labeled "Olio Per Insalata Sopraffino Melillo Brand, Compound Olive Oil and Cotton Salad Oil. Serial No. 9663," was shipped in interstate commerce by Marchesini Brothers, of this city. Samples analyzed by the bureau of chemistry were declared to be misbranded and proceedings were instituted in the United States court for the southern district of New York, it being alleged that the product was misbranded in that it was labeled so as to deceive the purchaser into thinking the product other than what it was, a mixture manufactured in this country. The defendants entered a plea of guilty and were sentenced to pay a fine of \$100.

Extract of Vanilla.—R. C. Williams & Co., of this city, shipped in interstate commerce a food product labeled "Slightly Colored with Burnt Sugar. Berwick XXX Pure Flavoring Extracts Vanilla. Manufactured by R. C. Williams & Co., 56, 58 and 60 Hudson St., New York." Samples were analyzed by the government chemists whose reports indicated that the product was misbranded within the meaning of the act. A plea of guilty was entered in the United States court for the southern district of New York to the charge of misbranding, which was based on the allegation that the purchaser would be misled by the label into believing that the product was an extract of vanilla whereas it was a diluted extract artificially colored to conceal its inferiority. The defendant plead guilty, and a fine of \$25 was imposed.

A product labeled "Williams Brand Flavoring Extract of Pure Vanilla, Guaranteed under the Food and Drugs Act of June 30, 1906. Distributors, Williams Bros. Company, Cleveland, Ohio," was shipped in interstate commerce by the Hall-Whitney Manufacturing Company, of Binghamton, N. Y. The bureau of chemistry reported that samples taken from the shipment and analyzed were adulterated. Proceedings were instituted in the United States court for the northern district of New York alleging misbranding and adulteration in that the product contained vanillin and caramel which fact was not stated on the label which represented the product to be a pure extract of vanilla. The defendants entered a plea of guilty and a fine of \$100 was imposed by the court.

The Semrad Chemical Company, of Chicago, Ill., sold to Habrecht, Braun & Co., of the same city, a quantity of a food product labeled "Hy-Grade Vanille-Ton." "A pure vanilla and tonka bean powder especially adapted for bakers. Absolutely Pure. Absolutely free from alcohol. Absolutely free from all other flavoring matters. In full compliance with all pure food laws. Habrecht, Braun & Com-

pany, Chicago, New York." With the delivery of the goods the company furnished a guaranty in writing that its product fully complied with the requirements of the food and drugs act. The Habrecht-Braun Company shipped the goods in interstate commerce. Samples taken from this shipment were reported by the government chemists to be adulterated. Criminal information was filed against the Semrad Chemical Company, charging that vanillin had been substituted wholly or in part for powdered vanilla and tonka in order to imitate the genuine product, and this fact was not stated upon the label. The United States court for the northern district of Illinois sentenced the defendant to pay a fine of \$100 and costs on a plea of guilty.

The Allan B. Wrisley Company, of Chicago, Ill., shipped in interstate commerce a consignment of a food product labeled "Bannon's Best Vanilla Flavor, containing vanillin and coumarin, artificially colored, Mfgd. by Allan B. Wrisley Company for Bannon & Company, St. Paul, Minn., for flavoring pies, cakes, creams, custards, puddings, etc." Samples of this product were analyzed in the bureau of chemistry. Upon the findings was based a criminal information filed in the United States court for the northern district of Illinois, charging that the preparation was adulterated and misbranded in that it was wholly or in part a solution of vanillin, coumarin and alcohol colored with caramel to conceal the sophistication, and offered as a vanilla extract. The defendant entered a plea of guilty and was sentenced to pay a fine of \$100 and costs on this charge and a joined one relative to lemon extract (see below).

Extract of Lemon.—A food product shipped in interstate commerce by Simon Ullmann and Samuel Dreifus, doing business under the firm name of Ullman, Dreifus & Co., of Cincinnati, Ohio, was labeled (on the carton) "King B Concentrated Extract of Pure, Imitation, Lemon. From the Laboratory of Ullmann, Dreifus & Co., Cincinnati, Ohio. For flavoring ice-cream, soda water, custard, cakes, jellies, confections, etc. The delicious flavor possessed by King B Concentrated Extracts is due to the excellence of the material used, and to the great care with which they are prepared"; (on the bottle) "King B Compound citral and lemon, Colored, manufactured by Ullmann, Dreifus & Co., Cincinnati, O." A sample was analyzed in the government laboratory, and proceedings were brought in the United States court for the southern district of Ohio in which it was alleged that the product was adulterated and misbranded in that it did not contain any oil of lemon and only a trace of citral, and that the label tended to mislead the purchaser into thinking that the product was an imitation extract of lemon whereas it was practically useless as a flavor. The defendant entered a plea of nolo contendere and the court imposed a fine of \$25 and costs.

A plea of guilty was entered in the United States court for the southern district of New York, by the Crandall Pettee Company, of this city, to the charge of violating the law by shipping in interstate commerce a quantity of a product labeled "The Crandall Pettee Company. All lemon compound put up especially for bakers' use. Of unusual sweetness and purity. Better than lemon oil because it needs not to be cut or reduced. Better than lemon extract because it will not bake out in the oven. For sale only by Crandall Pettee Company, 40-42 Renwick Street, New York City." In the suit it was alleged that the product was misbranded in that the label tended to deceive the purchaser into the belief that it was oil of lemon, whereas the government chemists reported that it contained nearly 80 per cent. of oil of sesame. A fine of \$5 was imposed by the court.

The Allan B. Wrisley Company, of Chicago, Ill., shipped in interstate commerce a food product labeled "Union Brand Compound Lemon Flavoring. A compound prepared from oil of lemon grass, citral and diluted alcohol." Samples from this shipment analyzed by government chemists and their reports indicated that the product was adulterated and misbranded. Proceedings were instituted in the United States court for the northern district of Illinois; and it was alleged that the product contained no oil of lemon and was an imitation flavor colored with a dye known as naphthol yellow S. The defendant plead guilty and a fine of \$100 with costs was imposed.

This same concern shipped in interstate commerce a product labeled "Bannon's Best Terpeneless Lemon Flavor 0.075 per cent. natural citral, artificially colored, Mfgd. By Allan B. Wrisley Company, for Bannon & Company, St. Paul, Minn. For flavoring pies, cakes, creams, custards, puddings, etc." It was deemed evident from an examina-

tion of samples of this consignment that the product was adulterated and misbranded. A criminal information was filed in the United States court for the northern district of Illinois setting forth the allegations that the product was wholly or in part an imitation terpeneless extract of lemon, being a solution containing 0.08 per cent. of citral and colored with naphthol yellow S; and that the manner of labeling it was deceptive. This proceeding was joined with one having to do with extract of vanilla, and the defendant plead guilty and was penalized as reported above.

In a consignment of food products shipped in interstate commerce by the Semrad Chemical Company, of Chicago, Ill., were a number of bottles labeled variously in the following manner: (1) "Extract Lemon Bakers', Solution Terpeneless Citral." (2) "Extract Lemon XXX, Soluble Terpeneless." (3) "Extract Lemon, Soluble, Terpeneless." (4) "True Lemon Flavor, Soluble Terpeneless." (5) "Lemon Flavor with Peels, Soluble Terpeneless." Samples of these several products were analyzed by the bureau of chemistry and as a result a criminal information was filed in the United States court for the northern district of Illinois. The allegations were that product 1 was a very dilute terpeneless extract of lemon containing only 0.04 per cent. of citral and practically no oil of lemon; that 2 and 3 were similar products, each containing only 0.135 per cent. of citral and practically no oil of lemon; that 4 contained but 0.1 per cent. of citral and practically no oil of lemon; and that 5 contained only 0.125 per cent. of citral and practically no oil of lemon. A charge of adulteration and misbranding was made, there being eight counts, including three having to do with extract of orange (see below). The defendant entered a plea of guilty and was sentenced to pay a fine of \$100 and costs.

Extract of Orange.—In the consignment of food products referred to in the preceding paragraph were three varieties of a so-called terpeneless extract of orange labeled respectively (1) "Extract Orange, Soluble Terpeneless." (2) "True Orange Flavor, Soluble Terpeneless." (3) "Orange Flavor with Peels, Soluble Terpeneless." Samples of these were analyzed by government chemists and subsequently information was filed in the United States court for the northern district of Illinois charging the shipper, the Semrad Chemical Company, of Chicago, Ill., with a violation of the act because, it was alleged, product 1 was a dilute terpeneless extract of orange containing only 0.075 per cent. of citral and practically no oil of orange; and that products 2 and 3 were similar preparations containing respectively 0.058 and 0.059 per cent. of citral and practically no oil of orange. The defendant plead guilty and was penalized as stated in the foregoing paragraph.

"Sherman's Headache Cure."—Orator F. Woodward, of Le Roy, N. Y., shipped in interstate commerce a drug product labeled "Sherman's Headache Cure, Trade Mark Registered in U. S. Patent Office; with other valuable ingredients, each capsule contains 2 grains of acetanilid, prepared for Orator F. Woodward, Le Roy, N. Y. See directions on bottle inside. Sherman's Headache Cure, Guaranteed under the Food and Drugs Act, June 30th, 1906, No. 95. Sherman's Headache Cure is for sick or nervous headache, neuralgia and sleeplessness." From the findings of the analysts who examined samples of this product it was charged in an action brought in the United States court for the western district of New York, that the product was misbranded in that the label was misleading because the preparation was not a cure for headache, etc. The defendant entered a plea of guilty and was fined \$25.

"Stanley's Instant Headache Cure."—Stanley K. Pierson, of Le Roy, N. Y., shipped in interstate commerce a drug product labeled "Stanley's Instant Headache cure for Headache in all its forms, neuralgic, rheumatic, grippe, muscular pains of malaria and disordered stomach and in all cases where speedy and pleasant relief from pain is desired. Price 10 cents. Prepared by Stanley K. Pierson, Le Roy, N. Y. Each tablet contains 2 3/4 grs. ascetenoid," etc. Samples were analyzed by the bureau of chemistry and declared to be misbranded because the label bore false claims of therapeutic worth, and a vague statement of the presence of acetanilide. Criminal information was filed in the United States court for the western district of New York; the defendant entered a plea of guilty, and the court imposed a fine of \$25.

"Break-Up-the-Grip Tablets."—A drug product was shipped in interstate commerce by John D. Langham, of Holley, N. Y., with the label: "Break-Up-the-Grip Tablets. for la grippe, colds, headache, all forms of neuralgia, rheu-

matic and malarial pains, price 25 cents. Manufactured by J. D. Langham, Holley, N. Y. The great laxative grippe cure; cures colds and grippe in one day. We claim these tablets to be the best in the world for la grippe, colds, headaches, and all pains and fevers where pleasant and speedy relief is desired. They leave no depressing results so common to most remedies now on the market, which are recommended for these complaints." On the end of the containers there were stamped in small, indistinct type by means of a rubber stamp: "Each tablet contains 2 grs. acetanilid." Samples were analyzed by the government chemists and from their findings proceedings were instituted in the United States court for the western district of New York charging that the product was misbranded in that the statements of curative properties, appearing on the labels were false and misleading. A plea of not guilty was first entered by the defendant, who subsequently substituted a plea of guilty. The court imposed a fine of \$25.

"Cactico Hair Grower."—Mrs. Gervaise Graham, of Chicago, Ill., shipped in interstate commerce a drug product labeled (on bottle) "Mrs. Gervaise Graham's Cactico Hair Grower. Will produce hair on bald Heads. Stops falling of the hair, keeps the scalp healthy." (Blown in side of bottle) "Mrs. Graham's preparations are pure and harmless. Mrs. Gervaise Graham, Beauty Doctor, Chicago and San Francisco." (On carton) "Mrs. Gervaise Graham, Cactico Hair Grower, 5 per cent. alcohol, and manufacturer of celebrated cosmetics, Chicago, Illinois. For sale by all leading druggists." Samples of this product were examined by the bureau of chemistry and reported to contain alcohol, 4.38 per cent. by weight (5.58 per cent. by volume); borax, 0.35 per cent.; glycerin, 6.79 per cent.; water, 88.49 per cent.; and capsicum. Criminal information was filed in the United States court for the northern district of Illinois, alleging misbranding because the statements on the label about the hair-growing property of the product were false and misleading. The defendant plead guilty and was sentenced to pay a fine of \$50 and the costs.

"Cures" for Drug Habit.—W. A. Starnes, of Atlanta, Ga., shipped in interstate commerce two lots of an alleged cure for drug habits. One of these lots consisted of twelve bottles numbered consecutively from 1 to 12, the bottle numbered 1 being labeled "Inman Park Pharmacy, J. F. Kern, Prop., 589 Kirkwood Ave., Atlanta, Ga., 2 or three teaspoonfuls with water 3 or 4 times a day each bottle in succession. Shake bottle before use," no label except the respective numbers appearing on the remaining eleven bottles. The second lot consisted of ten bottles numbered consecutively from 1 to 10, the first bottle being labeled "Open all night. Elkins-Watson Drug Co., Cor. Marietta and Peachtree sts., Atlanta, Georgia. 2 or 3 teaspoonfuls 3 or 4 times a day. Take each bottle in succession. Shake bottle. Merck's chemicals and Squibb's preparations used in dispensing." The remaining bottles bore no label except the numbers. From the reported findings of the government chemists who analyzed the products proceedings were instituted in the United States court for the northern district of Georgia charging the shipper with an infraction of the law because the product in question was misbranded in that the morphine present in the several mixtures was not declared on the labels. The defendant plead guilty and was sentenced to pay a fine of \$25.

W. J. Tucker, of Atlanta, Ga., shipped in interstate commerce a drug product labeled "Dr. W. J. Tucker, 43 1/2 Whitehall Street, Atlanta, Ga. Prepared exclusively for L. F. Kay. Take a teaspoonful in water 3 times a day. Make each bottle last a week or more." Samples were analyzed by government chemists and subsequently suit was brought in the United States court for the northern district of Georgia alleging that the product was misbranded in that it contained morphine and alcohol, which fact was not stated on the label. On a plea of guilty the court imposed a fine of \$25.

Tincture Cadomene Concentrated Compound, Compound Fluid Balmwort, and Compound Essence of Cardiol.—A consignment of eight casks of drug products was shipped from Detroit, Mich., to Dayton, O., labeled "Prescription Products Co., Dayton, Ohio, P. D. Co.," four casks bore, in addition, "S. 59884," one "S 56527," one "S 59736," and two "S 61015," the first five packages containing a product marketed as "Tincture Cadomene Concentrated Compound," the one next mentioned containing a product marketed as "Compound Fluid Balmwort" and the two packages last mentioned containing a product marketed as "Compound Essence of Cardiol." On analyses of samples by the bureau

of chemistry the products were alleged to be misbranded, and a libel was filed in the United States court for the southern district of Ohio charging misbranding in that none of the containers were labeled to indicate the alcoholic content of the preparations. The Prescription Products Company filed its claim to the goods averring that it was in possession of the products at the time of seizure and was the bona fide owner; and subsequently filed a demurrer setting forth that the court was without jurisdiction in that no seizure of the goods had been made prior to the filing of the libel; that the libel was not properly verified by any person having knowledge of the facts; that it did not appear from the averments that the goods were still subject to the provisions of the act in said libel; and that the libellant had not stated a case that had any application to shipments of this character. After hearing argument of counsel the court sustained the demurrer on all of the grounds, and the goods were released from the custody of the marshal.

Oil of Turpentine.—A consignment of a drug product labeled "Pure Spirits of Turpentine" was shipped in interstate commerce by the United States Turpentine and Linseed Oil Company, of this city. The consignment was sampled by government inspectors and after analysis by the bureau of chemistry was reported to be adulterated and misbranded in that it contained a large amount of mineral oil. A libel based on this report was filed in the United States court for the district of Connecticut, which issued a decree ordering the marshal of the district to destroy the product unless prior to a given date the company should pay the costs of the proceedings and file a bond in the sum of \$100 conditioning that the product should not be disposed of contrary to the law.

Ice Cream Cones and Ice Cream Clams.—In April, 1910, there were shipped in interstate commerce five packages of ice cream cones each labeled "Consolidated Ice Cream Cones—16—Wafer Company, Inc., Brooklyn, N. Y., U. S. A. Sole Manufacturers Consolidated Wafer Co., Brooklyn, N. Y., U. S. A.," and "The Brooklyn Ice Cream Cone Manufactured by Consolidated Wafer Co., Inc.," and thirty-five packages of ice cream clams, each package of which was labeled "Consolidated Wafer Co., Incorporated. Manufacturers of high grade Ice Cream Clams. Very tasty clams. Ice Cream Novelties." Upon the examination of samples by the bureau of chemistry the products were declared to be adulterated in that they contained boric acid and salts thereof. A libel was filed in the United States court for the eastern district of Pennsylvania alleging that the products had been shipped in violation of the law. No claimant appeared when the case came up for hearing, and the court decreed the destruction of the lot.

A consignment of a product shipped in interstate commerce from Brooklyn, N. Y., and labeled "Sole Manufacturers. The Valvona Marchiony Co. Cones, Brooklyn Borough, New York." "The Valvona Marchiony Co., Manufacturers of Wafers and Wafer Cup Specialties, Brooklyn, N. Y." "Ice Cream Cones. We guarantee that these products which are manufactured and sold by us are not misbranded within the meaning of the Food and Drugs Act of June 30, 1906. The Valvona Marchiony Co." It appeared from the findings of the government chemists that the product was adulterated with boric acid and salts thereof, and suit was instituted in the United States court for the eastern district of Pennsylvania. No claimant appearing to defend the libel the court decreed the destruction of the libeled cones.

The Star Wafer Company, of Oklahoma City, Okla., shipped in interstate commerce a quantity of product labeled "Ice Cream Cones. Star Wafer Co. Factories Oklahoma City, Birmingham, Jacksonville, Dallas, El Paso, Los Angeles. General Offices, Oklahoma City, Okla. Each cone sweetened with less than 1/60 grain saccharin." Examination of samples of this product by the bureau of chemistry was alleged to show it to be adulterated. Proceedings were instituted in the United States court for the district of Nebraska in which it was alleged that the product was adulterated because containing boric acid. No claimant appearing to answer the libel the court decreed the destruction of the cones.

Calcium Acid Phosphate.—A product labeled "Provident Chemical Works, 300 lbs. C. A. P. St. Louis. Serial No. 381. P. C. W. New York," was shipped in interstate commerce. Samples were taken and analyzed by the bureau of chemistry. As a result a criminal information was filed in the United States court for the district of Massachu-

setts in which it was alleged that the product was adulterated in that it contained a considerable amount of starch. Later an amendment to the libel was filed adding the charge of misbranding because the labeling "C. A. P." would convey the impression that the product was calcium acid phosphate whereas it was not entirely so. The product was claimed by the Provident Chemical Company, who denied the charge of adulteration, but admitted that the product was misbranded. The court ordered that the product be delivered to the claimant upon the payment of the costs of the suit and the filing of a bond conditioning that the goods would not be disposed of contrary to the law.

Some Fakes Exposed.

Continuing its good work of laying bare the falsity of many claims made by fakers in the field of medicine, the *Journal of the American Medical Association* gives some information which is presented in abstract below:

DR. BRANAMAN REMEDY COMPANY.

Details of federal investigation of a mail-order "deafness cure" concern are presented. The concern in question is the Dr. Branaman Remedy Company, of Kansas City, Mo., which was conducted by G. M. Branaman, M. D., a graduate of the medical department of the University of Louisville, 1891. Branaman obtained victims by advertising to cure deafness and offered to send "two months' medicine free" to those who applied. His method was, on receiving a letter from a prospective patient, to send the usual "symptom blank" and ask that it be filled out and returned to him. When this was done the patient was informed that his case was far too serious to be treated merely by medicines and that what he needed was the "electro-magnetic headcap," which Branaman would furnish, with medicines, for the sum of \$8. If the money was not sent the patient received a series of "follow-up" form letters that were made to simulate personal communications, each letter urging the purchase of the "headcap." If the amount was paid the "headcap" was sent, together with some simple remedies. The post-office inspectors entered into correspondence with Branaman as supposed patients and filled out five symptom blanks, describing therein five cases of total and incurable deafness. Branaman promised to cure each of the hypothetical patients and urged each to send \$8 for the "headcap" and medicines. It was proved that Branaman was publishing a testimonial from a man who was so deaf that he was unable to work, as one having "perfect hearing" since he used Branaman's remedies. It was also shown that, while Branaman represented that he gave individual treatment and attention to every patient, as a matter of fact the same "treatment" was sent to practically all persons sending the necessary \$8. As a result of the inquiry the delivery of mail and the payment of money-orders was prohibited to both G. M. Branaman and to the Dr. Branaman Remedy Company.

OXYDONOR; OXYGENOR; OXYGENATOR.

Three mechanical frauds—the "oxydonor," the "oxygenor" and the "oxygenator"—are discussed. The oxydonor, the oldest of the three and the most widely advertised, is a modification of an earlier fake known as the *electropoise*. The essential parts of all are (1) a metallic cylinder, (2) one or more flexible cords or wires, and (3) disks to be attached to the ankle or wrist of the individuals who use them. Some of these pieces of nickel-plated piping are filled with a mixture of sand and sulphur, others have a stick of plain carbon in them, while the *electropoise* was empty. Their price varies from \$10 to \$35, and they are claimed to cure every known disease. The advice given by the exploiters of the "oxygenator" is particularly vicious, as people are urged to rely on this piece of gas-pipe for the cure of diphtheria in children. The *Journal* says that the "electropoise," the "oxydonor," the "oxygenor" and the "oxygenator" are utterly worthless, aside from the element of suggestion—except as a means of enriching their exploiters.

RADIO-SULPHO CANCER "CURE."

Another cancer cure humbug is briefly described. Radio-sulpho, as the "cure" is named, emanates from Denver. It was examined by the official chemists of Colorado, who reported that it consists of a strongly alkaline solution of sodium sulphide with a little sodium carbonate. The exploiters of this bad-smelling compound recommend the use

of a "cheese poultice" in connection with their nostrum. The poultice is to be made by mixing Limburger cheese and glycerin to the consistency of a paste and applying the mixture to the cancer after having washed the parts with "radio-sulpho." The cost of this odoriferous fake is \$25 a month "and upward."

Consumption "Cures" Scored.

In an address on "The Advertised Cures for Tuberculosis" Dr. Lyman F. Kebler, of the federal department of agriculture, severely scored the manufacturers of this class of nostrums at a meeting held in the interest of the public health at Baltimore, February 8th. The speaker charged that the so-called consumption "cures" not only did no good, but wrought a vast deal of harm in that they caused the misguided patients to lose valuable time in placing themselves under competent care, the nostrums in question also dulling the vital forces and lessening the chances of recovery. These medicines, he said, often contain nothing at all which could assist recovery, but have as large a proportion of narcotics as the law allows, or a percentage of alcohol which made them nothing more than disguised beverages. Dr. Kebler went on to say that he for more than a year had studied the composition of the nostrums, the manufacturers of which asserted through advertisements that they would cure consumption in a short time. He had found that the medicines would not cure, but in numerous cases caused the afflicted persons to become addicted to the use of narcotics.

Dr. Kebler referred also to the advertised "soothing" syrups for children and said that these preparations served merely to make the brain sluggish and impair the vital powers, checking development and wrecking the constitutions of the little ones. Ignorant mothers encouraged by statements that such articles were good for the child, and "perfectly harmless," "a pure vegetable compound," dosed their children and laid the foundation for lives of misery. Dr. Kebler blamed the newspapers for publishing the advertisements of the nostrum "fakers," and also took to task some of the medical publications, which, he declared, were not free from such things. Even some doctors, he said, would prescribe secret remedies, without stopping to inquire if they were desirable things to give.

Dr. Kebler pointed out that, as under pure food and drugs laws the content of narcotics, alcohol, etc., must be stated on the label, all persons should read what a compound contains and refuse preparations that are merely "dope." He urged that every one insist on being informed as to what he is getting.

Canadian Association and Prescription Pricing.

At the 1910 meeting of the Canadian Pharmaceutical Association, after J. E. Tremble, of Montreal, Que., had read a paper on "Prescription Prices," the association voted to recommend to the druggists of the Dominion, the following scale of prices for ordinary prescriptions:

Mixtures, 8 ounce.....	\$1.00
Mixtures, 6 ounce.....	.75
Mixtures, 4 ounce.....	.65
Mixtures, 3 ounce.....	.50
Mixtures, 2 ounce.....	.40
Mixtures, 1 ounce.....	.25
Mixtures, 4 dram.....	.25
Pills, ready-made, 1 dozen.....	.25
Pills, hand-made, 1 dozen.....	.50
Capsules, 1 dozen.....	.50
Konseals, 1 dozen.....	.50
Suppositories, 1 dozen.....	1.00
Ointments, 1/2 ounce.....	.50
Ointments, 2 ounce.....	.75

Dispensing Fees in Austria.

A new and slightly higher, Arzneitaxe (pharmaceutical price list) has become operative in Austria. The fees which the pharmacists are allowed to charge for dispensing manipulations are as follows:

For each act of dispensing a charge of 20 hellers (4 cents) must be made; for each mixing of liquids or ointments, double that amount; for dividing a substance into ten powders, at least 50 hellers (10 cents); and as much for each infusion; for all other manipulations, including the boiling of substances and the making of any number of pills up to 100, 80 hellers (16 cents). For the weighing of amounts above 1 centigram a slight additional tax is charged, and for smaller quantities than that, the additional tax is doubled.

Revising the Pharmacopœia.

While it is a little early yet to say much about what the ninth decennial revision of the United States Pharmacopœia is to be, it may be stated authoritatively that work on it is progressing rapidly and that, barring accidents and unforeseen complications, the new book will be on the press before the expiration of half the time it took to get its immediate predecessor ready for the printer. One reason for this is the fact that actual work on the text of the eighth revision did not begin until the "scope" of the book had been determined, while now work is well under way on standards, description, preparations, etc., of drugs which are sure to be included in the revised book, whatever its scope is to be. It is expected that the final report of the committee on scope will be ready in a few months, although the differences of opinion among the members of the committee, nearly all of whom are physicians, as to whether the Pharmacopœia shall be a skeleton or a padded book or neither, are still unsettled. However, it is not too early to predict that many old-time remedies will be no longer official when the new Pharmacopœia is promulgated, and that many names will be found added to the list of official drugs. No radical change in the general arrangement of the book or in the general treatment of the drugs and preparations listed in it, are expected.

PROMPT WORK LOOKED FOR.

Other reasons for the expectation that the ninth revision will take less time than the eighth are based upon the fact that the convention was incorporated ten years ago, and so has a continuous existence, much work done by the committee of revision prior to the 1910 meeting being available for the use of the present committee; and the further fact that whereas formerly the large drug and chemical manufacturing concerns rendered no aid in the revision of the book, since the passage of the food and drugs act, which makes it incumbent upon these manufacturers to use the Pharmacopœia as their guide, they, with their trained workers and unsurpassed facilities, are giving valuable help in the work of revision. Of course, the work of one revision committee has always been available for use by its successor, but incorporation and the more thorough organization made possible thereby, has been of use in this direction. A third reason for expecting more prompt work is based upon a change made in the size of the revision committee.

HOW THE PHARMACOPŒIA IS REVISED.

Just here it may be worth while to remind some who have not kept in close touch with pharmacopœial matters, how the book is revised. A convention made up principally of delegates from medical and pharmaceutical colleges and associations, although among them are a few from other bodies, including several of the departments of the United States government, meets once in ten years at Washington for the purpose of adopting certain general principles to be followed in revising the Pharmacopœia. As just stated, this body was incorporated in 1900, its official title being The United States Pharmacopœial Convention. It has been customary for this convention to appoint a committee of some twenty-five members to take charge of the work of the convention during the ten-year interval, that is to say, to revise, publish, and sell the book; but in 1900 the work of this committee was divided, and the business end of it was imposed upon a board of trustees composed principally of business men, while the scientific work was referred to the committee of revision. Last year a further change in the arrangement was made. It was thought that a committee of revision composed of twenty-six members (as was the last one) was, on the one hand, not sufficiently large and representative, and, on the other, too cumbersome to do its work promptly, so a general committee of revision was appointed, consisting of fifty members, exclusive of the president of the committee, who is an ex-officio member, and this general committee was authorized and directed to appoint from among its members an executive committee of revision to consist of fifteen members, the larger committee to have general control of the revision, while the smaller one was to have direct supervision of the work. This plan seems to be working satisfactorily.

PROF. REMINGTON AT THE HELM.

Prof. Joseph P. Remington, of Philadelphia, is chairman of the general committee of revision, which makes him ex-officio chairman of the executive committee of revision, and as such he is immediately in charge of the entire work

of revising the Pharmacopœia, and, of course, has an immense amount of correspondence to attend to and innumerable details to look after.

TARDY AID FROM THE GOVERNMENT.

It was hoped that the work of the United States public health and marine-hospital service in collecting and classifying the comments on the Pharmacopœia would be of material assistance to the committee of revision, but if this work continues at its present rate of progress, it is expected that the Pharmacopœia will be published before the later volumes of the government-made "digest" are available. However, as the three volumes that are already out cover the three years immediately following the publication of the present Pharmacopœia, they doubtless contain abstracts of or references to most of the comments that have been made on that book, as most of those who had any complaints to make or criticisms to offer doubtless relieved their minds before the Pharmacopœia was over three years old.

In their work on the determination of certain physical constants of the materials with which they are dealing, the members of the revision committee are beginning to feel somewhat handicapped by the lack of certain uniform data as to boiling and melting points. These data are to be supplied by the United States government, whose chemists and physicists have not yet entirely worked them out.

IDENTIFYING STANDARD DRUGS.

It is interesting to note that each specimen of crude drug on which members of the committee of revision work, has first been certified by the chairman of the sub-committee on botany and pharmacology, Prof. Henry Kraemer, of Philadelphia. In like manner, the identity and purity of samples of volatile oils for use as standards, are certified by the chairman of the committee on volatile oils, Dr. Harvey W. Wiley, of Washington.

AS TO OFFICIAL STERILIZATION.

Many matters of importance which the convention of 1910 found it impracticable to settle, were referred to the general committee of revision, among them being a recommendation—

That a chapter on sterilization be introduced describing the proper methods for sterilizing medicaments and indicating to what preparations each method is especially applicable.

This recommendation has been referred to a special committee, of which Dr. J. M. Francis, of Detroit, is chairman, with a view to having the committee draft a tentative article on this subject. There has been some doubt expressed as to the wisdom of introducing such a chapter. The executive as well as the general committee of revision may be relied upon to act in a safe and conservative manner on the report of the special committee. The Swiss Pharmacopœia has such a chapter.

A NEW MEMBER OF THE EXECUTIVE COMMITTEE.

Prof. A. H. Clark, who has been elected to the place on the executive committee, made vacant by the death of Prof. Hallberg, has been assigned to the sub-committees on general and organic chemistry, proximate assays, and miscellaneous galenicals. Prof. Hallberg was chairman of the latter sub-committee, and an election is now in progress to choose his successor as such.

FIN DE SIECLE.

The forthcoming revision will be the tenth decennial issue of the United States Pharmacopœia, and its final publication will mark the end of the first century of real Pharmacopœia-making in this country.

Federal Positions Open.

The United States civil service commission announces an examination to be held March 29th, for the purpose of securing eligibles to fill a vacancy in the position of *editorial assistant* in the bureau of mines, department of the interior, at a salary ranging from \$1,200 to \$1,500 per annum. The examination will consist of tests in editing, proof-reading and thesis-writing, and there are high requirements as to education and experience. Applicants must show that they are college or technical school graduates and that their education has included courses in chemistry, physics and higher mathematics.

There is also a \$4500 position as *professor of chemistry* to be filled in the public health and marine-hospital service. An experienced chemist with the degree of doctor of philosophy or doctor of science is wanted. Application blanks may be had from the commission.

New York Anti-Narcotic Ordinance Modified.

Influenced no doubt by the storm of protest arising among pharmacists, physicians and the public, which has beaten against it almost continuously since the enactment of the amended anti-opiate ordinance August 26th (see the CIRCULAR for September last, page 492) the board of health of this city at a meeting held February 7th, adopted the following modified form of the section of the code dealing with the sale of narcotics:

Section 182. No cocaine or salts of cocaine, eucaine, stovaine, alpha- or beta-eucaine, either alone or in combination with other substances, or any substance under any other name giving a similar chemical test of cocaine; and no opium or official preparation of opium, and no morphine or salts of morphine, or the derivatives of either or any of them, shall be sold at retail by any person in the city of New York except upon the written prescription of a physician, duly authorized to practise as such or other person duly authorized by law to practise medicine and administer drugs, or perform surgery with the use of instruments. Any such prescription shall not be refilled.

Nothing hereinbefore mentioned, however, shall apply to compounded mixtures containing opium or morphine or their derivatives, the formulas for which are given in the latest Dispensatory or National Formulary, in which said mixtures the maximum dose, as plainly stated on the label of the package as dispensed does not contain in excess of one-half a grain of powdered opium or the equivalent of its alkaloids; or to preparations for external use only, in the form of liniments, lotions, ointments or oleates.

The last-mentioned preparations shall be labeled "For External Use Only," and marked "Poison."

This new ordinance has been discussed at meetings of several local organizations as may be seen in the reports thereof in this issue; and, although the feeling of the discussion is not totally favorable to the present form of the measure, it is considered more satisfactory than its predecessor. The health authorities are stated to have been converted to the opinion that the former measure was too drastic. They also appear to have hearkened to the criticism of the ordinance because of its lack of clarity.

It is rumored that the proprietary manufacturing interests are considering the advisability of contesting the validity of the ordinance. Inquiry at the office of the board of health elicited the information that the authorities had no indication of any protest either from the makers of nostrums or from the proprietors of the patented derivatives of opium.

Kings County Society.

The prospect of much of interest arising drew a large attendance for the meeting of the Kings County Pharmaceutical Society held February 14th. There was no dis-appointment in the nature of the session.

One member was added to the enrollment; and three applications for membership were received.

The report of Treasurer Adrian Paradis showed a balance to the credit of the society of \$350.45 and one to the credit of the Brooklyn College of Pharmacy of \$9,814.74.

For the legislative committee Dr. William Muir reported briefly on the hearing on the Foster bill (see last month's CIRCULAR, page 105). He related that four pharmacists in New York and four in Brooklyn had endeavored to carry out the provisions of the Foster bill and had found it an extremely difficult task, especially during the busy hours of the day. Dr. Muir also spoke of several bills now before the State legislators and called attention to the one which purposes to prohibit the giving of souvenirs with drug-store purchases. This bill, he thought, was a good one, as the practice it was aimed at was demoralizing to the best interests of pharmacy. He gave an outline of the Turley bill which provides that upon all physicians' prescriptions must be stated whether the prescription is for an adult or a child, and if for the latter its age must be stated; and of the Pollock bill which provides that any licensed pharmacist may become a member of the State board of pharmacy without having as at present is required ten years' experience in the practice of pharmacy and that the secretary of the board be appointed by the governor for three years. Dr. Muir did not favor this bill and said that the State association would appear against it.

In connection with the report of the committee on legislation the recently promulgated amendment to section 182 of the municipal sanitary code (see above) was discussed and the members were largely of the opinion that it was a decided improvement on the original anti-morphine ordinance. Dr. Muir called attention to one feature of the ordinance which in his opinion was inconsistent. This is that, as he believed, a doctor's prescription for any sub-

stance containing the prescribed opium derivatives may not be refilled, yet any of the same substances may be sold over the counter to customers as the druggist sees fit providing the maximum stated dose does not exceed one-half a grain of opium or its alkaloidal equivalent. The recognition of the dispensatory need not bother the druggist, said Dr. Muir, as it gives him greater latitude than would the specification of the Pharmacopœia. He thought that the clause which prohibited the refilling of prescriptions would be disapproved by physicians.

For the telephone committee Dr. Muir announced that a hearing would be held before the public service commission February 24th.

Charles Heimerzheim reported that the work of the committee on trade matters was progressing. He said that the druggists did not seem as eager for the propagandic post cards as had been expected. He reported having a balance of \$13 on hand. It was decided to continue the propagandic detail man at work for another month.

Prof. W. C. Anderson called attention to the practice of a Brooklyn hospital which he said had printed upon its prescription blanks the information that the medicine could not be properly compounded at any other place than the hospital dispensary. President Rehfuß said that this was no doubt done to force the patient to return to the hospital for the medicine, as it was the aim of such institutions to make the dispensaries self-sustaining. A committee was appointed to confer with the hospital authorities in an endeavor to have the practice eliminated.

Dr. Muir called attention to the work of the late Prof. Hallberg in pharmacy's behalf, and to the worthiness of the Hallberg memorial fund. The sum of \$25 was appropriated to this fund.

The chairman of the committee on pharmacy, Otto Raubenheimer, introduced T. J. Keenan, who read a paper on "Prof. Ehrlich's Side-chain Theory and the New Science of Chemo-therapy." Mr. Keenan was assisted in the presentation of his subject by O. O. R. Schwidetzky, who demonstrated some of the appliances used in the administration of Ehrlich's remedy. At the close of the address some interesting discussion was indulged in. Prof. Joseph Kahn commented on the chemistry of the new remedy.

Both Mr. Keenan and Mr. Schwidetzky were formally thanked by the society.

A talk on "Milk Analysis," by Dr. J. L. Mayer, was announced for the March meeting.

New York Alumni Doings.

The Alumni Association of the College of Pharmacy of the City of New York, Columbia University, held its sixteenth annual ball on the evening of February 1st, at Eldorado Hall, this city. The ball room and the fraternity boxes were beautifully decorated in the colors of the college and the several fraternity colors. The attendance was large and the affair was a success financially as well as socially.

The dancing was continued until close on to daybreak.

A lecture was given under the auspices of the alumni association at the college building, February 15th. William G. Williams, a man of many travels, spoke on "Mexico, Our Sister Republic." His address was illustrated with stereopticon views and was quite instructive as well as highly entertaining.

After the lecture an informal dance was held in the library.

New York German Apothecaries.

Following the opening routine at the meeting of the New York German Apothecaries' Society held February 2d, Emil Roller, chairman of the committee on scientific papers, recalled to the members the social and scientific meeting which had been held three years ago, and advocated having a similar entertainment this year. He went on to say that he had secured Prof. Max Mueller, of the University of Pennsylvania, for an evening in April, who would lecture on "Life in Egypt at the time of Moses, 1500 B. C.;" and he thought that a social gathering could easily be arranged at the close of the lecture, which would especially interest the ladies because Mrs. Max Mueller had promised to be present and to wear the splendid Egyptian ornaments which she had acquired during her stay in Egypt. This suggestion was very favorably received, and an appropriation for the expenses was made.

S. V. B. Swann reported as chairman of the legislative committee that he had answered the request of the Man-

hattan Pharmaceutical Association regarding the formation of an agitation committee to fight the \$50-city license fee which was levied for the sale of combustible substances, but that he had heard nothing more of the matter. He also read a detailed report on the Foster bill which he said would entail many new hardships on the druggists and ought to be fought with every means in their power.

In the discussion following this report the members expressed very decided views against the bill. O. P. Gilbert was of the opinion that a law should be passed forbidding the general sale of narcotics and permitting it only to apothecaries. Felix Hirseman held a like view, and further thought that the board of pharmacy should be requested to make public the extent of the sales of narcotic drugs and chemicals. This led to the passing of the following resolution which Mr. Swann was instructed to forward to the board:

Resolved, That the board of pharmacy be requested to have published in the pharmaceutical and medical press the record of sales of narcotic drugs for the past six months, as shown in the reports of the board's inspectors of wholesalers and manufacturers to retailers and others, giving names of all parties therein recorded or concerned in said transaction.

Some additional discussion of the Foster bill followed, Dr. W. C. Alpers reporting that the conference committee of the local pharmacal organizations had formally protested against the enactment of the bill. Subsequently the society passed the following resolution:

Resolved, That while we favor restriction in the sales of morphine and cocaine or their salts, we must strenuously oppose the passage of house bill 25241, known as the Foster bill now in ways and means committee and under consideration by that honorable committee, owing to its most drastic provisions and the hardships entailed thereby upon the retail drug trade.

Mr. Gilbert, chairman of the entertainment committee, reported that arrangements had been completed for the musical and social affair to be held February 23d. He also reported on the progress of the plans for celebrating the sixtieth anniversary of the society in October.

The speaker of the evening was Dr. Friederich Klein, who presented in an interesting and erudite manner the subject of "The Members of the Sulphur Group." He told of the occurrence, production, purification, and uses of sulphur, selenium, and tellurium. A lively discussion ensued; and Dr. Klein was formally thanked.

Acquainting the Public with Pharmacy.

In a series of public lectures being given in this city under the auspices of the College of Pharmacy of the City of New York, Columbia University, in co-operation with the Educational Alliance, it is purposed to bring about a better understanding among the laity, of the profession and public duty of the pharmacist. The lectures are given each Monday evening at 8:30 o'clock in the Educational Alliance Auditorium, 197 East Broadway, Manhattan. Admission is by ticket, which may be had free from the alliance.

Three lectures have been given. The following three are yet to come:

March 6th, "The Legal Standards of the Pharmacist," by Otto Raubenheimer.

March 13th, "The Drug Trade and the Public," by Dr. William Jay Schieffelin.

March 20th, "The Practical Side of the Retail Drug Business," by F. E. Holliday.

The speakers during February were Prof. C. F. Chandler, Albert Plaut, and Dr. H. H. Rusby.

Medical Lodge Unchartered.

At the instance of the attorney-general Justice Kelly of the supreme court of this State recently revoked the charter of the Equitable Medical Company, of this city, on the ground that the concern was carrying on an insurance business without having been rightfully incorporated to do so.

It is stated that the plan of the company was to supply medical attendance and medicine, and, if death occurred, to bury the subscriber in style; also there was some sort of an insurance prior to death; all for a premium of \$200 paid at the rate of 5 cents a week.

Anthony F. Ruppel has purchased the store known as Westphal's Junction Pharmacy, Communipaw avenue and Grand street, Jersey City, N. J.

Meetings of American Pharmaceutical Association Branches.

New York.—Because of a volume of incidental discussion it was impossible to carry out the program scheduled for the meeting of the New York branch of the American Pharmaceutical Association held February 13th. The proposed discussion of the publication plan of the *Journal* of the parent body was postponed.

President G. H. Hitchcock opened the meeting, the first under his rule, with an expression of hope in the future of professional pharmacy and of a desire for still better cooperation with the medical profession.

Treasurer Joseph Weinstein reported a balance on hand of \$42.55.

For the membership committee Louis Berger presented one application. Later W. F. Macdowell reported having several candidates ready.

For the committee on the progress of pharmacy Otto Raubenheimer presented a detailed critique of the new German Pharmacopoeia. His conclusion was that the D. A. V. while markedly precise and clear in much of the text, particularly with regard to the directions, yet in many instances was lacking in clarity and completeness.

T. P. Cook, the chairman of the legislative committee, was not able to be present, and his report was read by the secretary. The committee reported that opposition to the Foster bill continued to grow. There was also a report on doings at Albany (see page 168).

Supplementary to this report Secretary Hugh Craig read the newly amended anti-narcotic ordinance of the local board of health (see page 164); and this measure was discussed at considerable length.

J. L. Mayer considered the legislative tinkering being done by pharmacal organizations to be folly and advised a straight go-ahead policy along the lines of the Beal model law. He did not favor giving to the board of health the right to interfere in the practice of pharmacy, because, as was shown in the instance of the ordinance in question the board was inconsiderate. His chief criticism of the measure was directed against the provision restricting the refilling of prescriptions.

Mr. Weinstein suggested that a draft of a State law be prepared based on the ordinance, as he believed this an improvement upon the former anti-narcotic ruling. He could not see the harm in prohibiting the sale of narcotic nostrums; and he believed it to be no more than right that the refilling of prescriptions for narcotics be prohibited.

Mr. Craig was of the opinion that the pharmacists had been blind to the trend of matters relating to the regulation of the sale of narcotics, and had by neglecting their opportunity to further restrictive legislation, left an open door for the anti-narcotic efforts of others.

Hiland Flowers averred that the anti-narcotic ordinance should be supported because fundamentally it was for the public good, and not unreasonable. He pointed out the misery arising from the use of narcotic nostrums and the misuse of prescribed medicaments.

Mr. Raubenheimer feared that the ordinance would not be thoroughly enforced and hence would result only in a disadvantage to the law-abiding druggist.

F. E. Niece and T. D. McElhenie also commented upon the ordinance; and at the suggestion of Mr. Flowers the branch will consider an all-State law at the next meeting.

The secretary announced the death of Maxwell Abernathy; and formal cognizance of this was taken.

In the exhibition and demonstration of useful dispensing accessories J. L. Lascoff showed an improved label cabinet in which each sort of label is held by a spring in a grooved compartment from which any desired one can easily be removed. Mr. Lascoff also demonstrated the usefulness of a prescription desk or bench having a glass top and sliding shelves on which the manipulations could be carried out.

Mr. McElhenie told of the utility of a meat-chopper in comminuting drugs, and exhibited a beveled piece of hardwood used as a powder folder, and also a snap suppository mold.

Mr. Craig described a suppository die which he had required for suppositories containing large amounts of asafetida; this die was made out of a piece of hardwood bored to size and a metal clamp. He exhibited a small sieve consisting of two tin ointment boxes with a gauze diaphragm between them; a "snap" catcheteur machine; an attachment for essential oil bottles for keeping a dropper handy

and protected from dust; and a string-and-board cutter for cacao-butter. He also told of the usefulness of an egg-whip in making cold-cream, etc.

Mr. Raubenheimer exhibited a plate for molding lozenges, and a bottle of shot he used as a counterpoise.

Cornelius DeJonge reported that by putting alternate layers of iodine and potassium iodide in a percolator and pouring alcohol over the chemicals it was possible to dissolve 19 ounces of iodine in 16 ounces of alcohol. Mr. McElhenie and Mr. Raubenheimer commented upon the preparation of tincture of iodine.

Mr. Lascoff told of a case of poisoning caused by "A. S. & B." pills, the victim not knowing that they contained a toxic ingredient. There was also some discussion as to a satisfactory diluent for hypodermic tablets. Mr. McElhenie favored sodium chloride, the general opinion favoring sugar.

Northern Ohio.—The meeting of the Northern Ohio branch of the American Pharmaceutical Association held at Cleveland, January 27th, was a somewhat informal gathering, as the inclemency of the weather interfered with the attendance. This was the annual meeting but on account of the small number present the election was deferred.

However, there were reports by President L. H. Hopp and Secretary-Treasurer H. V. Army and the chairmen of the several standing committees. All of these augured favorably for the prosperity of the branch.

The first discussion had to do with the proposed Hallberg memorial fund which was unanimously favored. There was considerable discussion of legislative matters, State Senator Krouse, a member of the branch, being present to learn of desired legislation.

A special committee was appointed to arrange a social affair to supplement the February meeting.

Philadelphia.—*Scientific Section.* Prof. J. O. Schlotterbeck, of Ann Arbor, Mich., was the speaker of the evening at the meeting of the scientific section of the Philadelphia branch of the American Pharmaceutical Association held February 4th. His subject was "The Deceptive Advertising of Foods and Drugs."

Prof. Schlotterbeck was unsparing in his condemnation of those proprietors of medicinal preparations who foist upon the public a concoction of little, if any, remedial value; and claim for their wares in the advertisements unlimited therapeutic worth. In the course of his remarks the lecturer showed with a stereopticon reproductions of labels and advertisements in which the extravagance of the claims was more than ordinary.

The Professor laid particular stress upon the statement that the newspapers were serious offenders in bringing to the attention of the public the extravagant and untruthful claims made for various preparations particularly for those exploited for the restoration of health and beauty. The housewife, he declared, was the individual most given to acting on the statements made in the daily press as to the merits of preparations in the way of drugs and foods and yet less likely to receive the information as to exposures and prosecutions concerning these very same articles. Such information, according to the lecturer, was more likely to reach scientific audiences and readers who already knew many of the facts, while not nearly the publicity was given to such exposures in the newspapers as was given to the claims of the manufacturers.

The subject was further discussed by Profs. J. P. Remington, Henry Kraemer, J. R. Minehart, C. H. LaWall, C. B. Kimberly and I. V. S. Stanislaus, and C. S. Brinton, W. A. Pearson, Christopher Koch, and Frederick Gordon.

Prof. Kraemer exhibited a comprehensive collection of growing drug plants, and showed some of the delicate optical instruments being used in the study of pharmacognosy. He also exhibited a number of micro-photographs of crystals.

Prior to the meeting Prof. Schlotterbeck was the guest of the section at a dinner at the New Hanover.

Pittsburg.—Several very interesting features marked the annual meeting of the Pittsburg branch of the American Pharmaceutical Association held in January. An interesting paper was presented by Andrew Campbell, of Greensburg, on the subject of "Some Practical Pharmacy not Ultra-Scientific."

This occasioned considerable discussion by Messrs. Beal, Koch, Judd, Emanuel, Kutscher, and Pritchard.

Dr. L. K. Darbaker gave an illustrated travelogue through England, France, and Germany.

The opening of the question box brought out the following information:

The only official standard for preparations of ginger that was known to the members was that of the new Dutch Pharmacopœia: To contain $4\frac{1}{2}$ per cent. of the alcohol-soluble constituents of 20 per cent. of the drug.

"Sesquicarbonate of ammonia" is a British synonym for the official ammonium carbonate.

"Sugar alcohol" if it contains the required percentage of ethyl hydroxide complies with the requirements of the Pharmacopœia.

The election resulted in the choice of the following officers: President, Andrew Campbell; vice-presidents, P. G. Walter and C. M. Dorsey; secretary, B. E. Pritchard; treasurer, P. H. Utech; committee chairmen; Membership, C. E. Willets; practice of pharmacy, J. F. Blumenschien; medical relations, G. W. Kutscher; education and legislation, J. H. Beal; publicity, W. R. Bell.

Washington.—The meeting of the City of Washington branch of the American Pharmaceutical Association held in February was a quite protracted session because of the voluminous discussion of National Formulary preparations. Practically every member present took part in this discussion and contributions of samples and comment had been sent in by W. C. Alpers, of this city; F. M. Apple and J. K. Thum, both of Philadelphia; C. F. Ninon, of Boston; and Otto Raubenheimer, of Brooklyn. Also H. A. B. Dunning, of Baltimore, was present and exhibited samples of a number of preparations. The discussion may be summarized as follows:

Acetic turpentine liniment.—For this popular preparation the revised formula suggested by Otto Raubenheimer (see the CIRCULAR for December, 1908, page 633) was generally endorsed. Mr. Dunning said that he had used practically the same formula for a number of years. He objected to the presence of rose water, and demonstrated that it added to the cost of the preparation without in any way adding to its elegance or efficiency.

Alkaline antiseptic solution.—Reversing the figures given for sodium borate and sodium benzoate in the present N. F., was commended as a step in the right direction. It was also suggested that the quantity of glycerin might be materially reduced, several members advocating a reduction of at least 50 per cent.

Aromatic syrup of eryodion.—There was general approval of the proposed modification in the method of procedure: to add the solution of oils in alcohol to the fluid-extracts before adding the alkali and the water. It was also suggested that magnesium carbonate might be added as an integral feature of the formula, and thus insure a more uniform product.

Compound digestive elixir.—It was agreed that the presence of pancreatin and diastase in this elixir might be advantageously dispensed with, and that a red elixir containing pepsin would, no doubt, meet with widespread use. The amount of glycerin in the present elixir was also objected to by some, as was the name. Mr. Dunning suggested calling it "Red elixir of pepsin," "Compound elixir of pepsin" was also suggested.

Essence of pepsin.—The use of a menstruum of alcohol and water to replace the wine in the present formula for this preparation was generally favored. Considerable difference of opinion existed in regard to a satisfactory flavor. Several members pointed out the desirability of using rennet devoid of sodium chloride. It was also suggested that the animal odor of the pepsin could be eliminated, without material injury to the ferments, by filtering the solution through willow charcoal before adding the oils or flavoring.

Magnesia magma.—This preparation was considered to be a useful one when properly made. The present N. F. directions were not thought practicable, and several of the members present suggested precipitating the magnesia in concentrated solution and washing with a definite amount of water so as to insure a minimum but uniform amount of sulphate present in solution.

Solution of aluminum acetate.—It was the consensus of opinion that the present N. F. directions for making this preparation are theoretically correct, but unworkable. It was stated that the directions of the new Pharmacopœia or

a slight modification of them could be used to advantage. Several of the members present saw no need for decanting the clear liquid, and preferred filtering. It was also suggested that the dry calcium carbonate might with advantage be added to the solution of aluminum sulphate and acetic acid.

Dr. G. A. Menge offered a paper on "A Standard for Tincture of Caramel." He suggested that a standard solution be made by heating on a boiling water-bath for exactly five minutes 0.5 gramme of sugar with 5 c.c. (mils) of a mixture of 2 volumes of sulphuric acid and 10 volumes of water; the resulting mixture to be partially cooled by the addition of 25 c.c. (mils) of cold water; neutralized with solution of potassium hydroxide; and diluted to 100 c.c. (mils).

This subject was discussed by Messrs. Kalusowski, Kehler, and Wilbert, all being agreed as to the desirability of having a color standard for caramel solutions.

S. L. Hilton exhibited and described the process of making some bismuth magma.

Dr. M. G. Motter announced the death of Leo Eliel, of South Bend, Ind. A special committee offered the following memorial resolutions (with a preamble) and they were formally adopted:

Resolved; That the members of the City of Washington branch of the American Pharmaceutical Association hereby record their appreciation of the great loss to pharmacy occasioned by the death of Leo Eliel; and be it further

Resolved, That a copy of these resolutions be forwarded to the members of the family of the deceased, and that they be embodied in our minutes, and offered for publication in the pharmaceutical journals.

After the appreciation of the branch had been formally extended to Mr. Dunning, adjournment was taken.

Brooklyn Druggists Would Curb Board of Health.

A called meeting of representatives of the pharmacal organizations of Brooklyn, N. Y., was held on the evening of February 22d. About two score were present. Otto Raubenheimer presided.

Considerable attention was paid to the question of taking away from local boards and councils the right to legislate concerning the practice of pharmacy. A draft of an amendment to the public health law of this State embodying an attempt so to restrict these bodies was endorsed. The meeting also passed resolutions protesting against the enactment of the Pollock bill (see page 164).

A permanent organization "for Kings county pharmacists" was launched with E. C. Krausche as president.

By the terms of a recently promulgated decree of the Argentine Republic government all pharmaceutical and dietetic products, vaccines, serums, diagnostic elements, mineral waters, etc., imported into the country shall be declared not only according to their tariff-classification, but also with their full specifications, such as the names of the manufacturer, the product, and the principal component materials. The declarations, on being presented to the customs, are to be transmitted to the national health department for the necessary action in respect to any products found to be in conflict with the pharmacy law.

Once again the fallibility of the colorimetric tests for alkaloids in the viscera has been brought forward to save a man charged with murder. This time the scene is Cincinnati, Ohio, the home town of Prof. John Uri Lloyd, whose "Stringtown on the Pike" was constructed around an incident of the same nature. Prof. Lloyd has taken an interest in the case in question and has criticized the "expert" evidence accepted.

Prof. C. M. Snow, for the past nine years assistant to the late Prof. Hallberg at the School of Pharmacy of the University of Illinois, has been appointed acting professor of pharmacy by the trustees of that institution. Prof. Snow was recently elected a member of the committee on revision of the National Formulary filling the vacancy therein created by the death of Prof. Hallberg.

The Wedgewood Club, of Brooklyn, N. Y., enjoyed a theater party and dinner on the evening of January 26th. Members and their ladies, a party of forty-one, attended the Majestic Theater. The dinner which followed was a sumptuous affair. Many informal speeches were made.

Some Contemplated Legislation.

Federal.—Protests continue to be voiced against the Foster bill. The drug trade section of the board of trade of this city at a meeting held February 1st protested vigorously against the enactment of the bill in its present form. It is the desire of the section to have the following exempting provision embodied in the bill:

Nothing hereinbefore mentioned, however, shall apply to compounded mixtures containing not more than two-grains of opium or not more than one-quarter grain of morphine in a fluid ounce, or, if a solid preparation, in an avoirdupois ounce; nor to preparations containing opium sold for diarrhoea and cholera, each bottle or package of which is accompanied by specific directions for use and a caution against habitual use; nor to powder of ipecac and opium commonly known as Dover's powder; nor to liniments, lotions, ointments or oleates and plasters when plainly marked "for external use only."

The Mann bill to enlarge the scope of the public health and marine-hospital service has been endorsed by the committee on interstate and foreign commerce. This endorsement begins with the following pertinent sentence: "There is nothing in the bill which relates to the practice of medicine or the art of healing, or which restricts personal liberty in this regard." It has been stated that the objections offered against this bill by medical organizations failed to impress the law-makers, because these generally were based on a premise diametrically opposed to the foregoing quotation.

Doubtless to do away with the cries of "violated personal freedom" Senator Owen has introduced an amendment to his bill seeking to provide a federal department of health, in which it is clearly stated that the bill does not attempt to go beyond the constitution in the matter of State rights and unjust discrimination.

Senator Owen has also introduced the following straight-advertising bill:

Be it enacted by the senate and house of representatives of the United States of America in Congress assembled, That all printed matter intended or paid for as advertisement matter in newspapers or magazines using the mails of the United States shall appear in the advertisement columns and be marked as such, so that the public can understand that such matter is an advertisement.

Sec. 2. That any violation of this section shall be subject to a penalty of not exceeding one thousand dollars for each offense, and the postmaster general is authorized to bar such publication from the mails until satisfactory bond is filed against its repetition.

Mr. Mann has another measure before congress, in which it is sought to amend the food and drugs act of June 30th, 1906, so as to require the net weight of the contents of a package of food to be stated within reasonable variation upon the label.

Arkansas.—It is sought in a bill introduced in the State legislature to make it illegal for any person other than a physician to offer or profess "by any verbal statement, writing, print, or other method, . . . to cure or treat any injury, disease or deformity of any human being by any drug, nostrum, manipulation or other expedient." The provisions do not apply to the administering of "domestic remedies."

Illinois.—The proposed new pharmacy law endorsed by the Illinois Pharmaceutical Association is a very comprehensive measure. Its terms are remarkably clear. The qualifications of board members are quite like those fixed by the New York law. College graduation is made prerequisite to registration as a pharmacist, and provision is made for the reciprocal interchange of licensure with the boards of other States. The provisions of the law are applied to nostrums containing any of the scheduled poisons. Strict adherence to the standards of the Pharmacopœia and the National Formulary are required. The sale of cocaine, or any of the synthetic substitutes for it, is made dependent upon a physician's prescription, or, at wholesale, upon the written order of pharmacist, physician, veterinarian or dentist. The prescriber of cocaine or its analogues to habitués is made illegal.

Iowa.—The State legislature is considering an itinerant vender's law.

Massachusetts.—Several food and drug measures have been introduced in the legislature; these are directed toward harmonizing the State law with the federal statute. Another bill requires the presence at all times of a registered pharmacist or assistant in every retail drug store.

Montana.—A food and drugs act quite similar to the federal act is before the law-makers; it gives to the board of health the power to fix standards and define adulterations; however, requiring the board not to act in contra-

vention of the provisions of the rules and regulations under the federal statute.

New York.—The legislature is full of pharmacal measures, the following being the more prominent ones: A bill to reduce the maximum number of hours constituting a drug clerk's day; a bill extending the right of registration as a pharmacist to physicians having the qualifications required of pharmacists prior to 1901; a bill to prohibit the sale of hypodermic syringes and needles at retail to any person other than a physician, dentist, or veterinarian or upon the written order of a physician or veterinarian; a bill to make it illegal for a druggist to give away premiums of any sort; a bill to require physicians to designate upon their prescriptions whether the patient is an adult or a child and the age of the latter; and a bill to reduce the qualifications of members of the board of pharmacy.

Ohio.—An itinerant vender's bill is on the calendar of the legislature.

Pennsylvania.—The Philadelphia members of the legislature were the guests of the Philadelphia Association of Retail Druggists at a dinner January 27th. There was a discussion of a proposed anti-narcotic law and the codification of the pharmacy law. A bill has been introduced by a Philadelphia representative in which it is sought to compel the declaration upon the labels of nostrums of the exact proportions of each component ingredient; and the labeling of a preparation "Poison" when it contains "more than 8 per cent. of ethyl alcohol or more than one-twenty-fifth of 1 per cent. of morphine, heroine, cocaine or of the salts or equivalents or derivatives of the same or any of them, or more than one-fourth of 1 per cent. of chloral hydrate or any quantity of belladonna, cottonroot, ergot or other abortifacient." Provision is made for the analysis of nostrums and for changes in formulas. This measure also contains the following provision relative to misleading advertising:

Section 5. Any person, firm or corporation or association or any employee thereof who in a newspaper, circular or other publication published in this State knowingly makes or disseminates any statement or assertion of fact concerning the quantity, quality, the value, the method of production or manufacture or the reason for the production of his or their merchandise or the manner or source of purchase of such merchandise or in the possession of rewards, prizes or distinctions conferred on account of such merchandise or the motive or purpose of a sale intended to give the appearance of a plan advantageous to the purchaser which is untrue or calculated to mislead in the advertisement of merchandise as herein stated [shall be subject to the penalties provided].

South Dakota.—The Morrissey-Giedt bill requires the publication in the official papers of lists of sophistications of foods, drugs, beverages, oils, etc., giving the brand of the sophisticated substance, the name of the responsible party, and the reason for considering the substance adulterated.

Louisiana Anti-Narcotic Measure.

The following stringent restrictions upon the sale of narcotics are embodied in several amendments to the sanitary code adopted by the Louisiana Board of Health, December 19th, 1910:

That every wholesale druggist, or person, firm or corporation selling drugs at wholesale, shall keep a register in which shall be entered each and every sale made by them, or their agents or employees, of cocaine, or its salts, derivatives or preparations, which register shall contain the name of the person or firm to whom such sale was made, with the date of such sale and the quantity and the form in which said drug was sold; and the said vender shall cause the purchaser to sign said register, giving the address from which the drug is to be retailed.

That no sale of cocaine, or its salts, derivatives or preparations shall hereafter be made to any person, firm or corporation other than one conducting a duly licensed drug business in charge of a registered pharmacist, and that all sales of cocaine, or its salts, derivatives and preparations, shall be made direct to the said pharmacist, and not through, or by the medium of any agent.

That every druggist who purchases cocaine, or its salts, derivatives or preparations, shall be required to submit to and file with the person, firm or corporation from which said drug is purchased, and before it shall be lawful for any vender to sell such drug, or its salts, derivatives or preparations, an affidavit duly sworn to before a notary public, stating that the amount of cocaine, or its salts, derivatives or preparations, which it is desired to purchase is necessary and merely sufficient for the legitimate needs of the trade of the purchaser; that the purchaser has not purchased any cocaine, or its salts, derivatives or preparations, from any other vender for thirty days prior to the making of the said affidavit; and the affidavit so made shall be annexed to and made a part of said register hereinbefore provided for, to be kept by the vender.

That the said register shall, at all times, be open to the inspection of the Louisiana State Board of Health, the district attorney and the police authorities of the several towns and

parishes of the State; and that the wholesale vender shall, in addition to the keeping of the said register, submit to the Louisiana State Board of Health on the first day of each and every month a signed statement containing a list of all persons, firms or corporations which have purchased cocaine, or its salts, derivatives or preparations, together with the amount of cocaine, or its salts, derivatives or preparations purchased.

Provided that no wholesale dealer shall sell to any one purchaser more than a total of one ounce of cocaine, or its salts, derivatives or preparations, during a period of thirty days; and further provided, that if two or more stores are operated by the same person, firm or corporation, one ounce of cocaine, or its salts or derivatives or preparations, per month may be purchased for each of said stores; provided, further, that the purchaser swears to the necessity for said quantity by affidavit and as hereinbefore provided.

That public hospitals, sanitariums or public or scientific institutions shall comply with all of the provisions of these regulations, except that sales to such institutions shall be limited only to the quantity that they may actually require.

That where the purchaser of cocaine, or its salts, derivatives or preparations, is not a resident of the city or town where the wholesale vender's establishment is situated, the purchaser may submit an affidavit by mail, together with a power of attorney authorizing the wholesale vender to sign the register in his place and stead.

Article I. That it shall be unlawful for any firm, or corporation to sell, furnish, give away, or to have in his, her, their, or its possession any cocaine, eucaine, opium, morphine, heroine, or any salts, or compounds of the foregoing substances, or any preparation or compound containing any of the foregoing substances, or their salts, or compounds, except upon the original written order or prescription of a lawfully authorized practitioner of medicine and bona-fide prescriptions of dentists, which order or prescription shall be dated, and shall contain the name of the person for whom prescribed, and shall be signed by the person giving the prescription or order. Such prescription or order shall be permanently retained on file by the person, firm or corporation, who shall compound or dispense or sell the articles ordered in the prescription, and such order shall not again be compounded or dispensed except upon the written order or prescription of the original prescriber for each and every subsequent compounding or dispensing of such article or articles. No copy or duplicate of such written order or prescription shall be made or delivered to any person, but the original shall at all times be open to inspection by the prescriber or properly authorized officer of the law; provided, however, that the above provisions shall not apply to paregoric and bona-fide proprietary medicines containing not more than two grains of opium, or not more than two-fifths of a grain of morphine, or not more than one-half grain of heroine in one fluid ounce, or if a solid preparation, not more than one avoirdupois ounce; provided, however, that the above provisions shall not apply to preparations containing opium recommended and sold in good faith for diarrhea and cholera when each bottle or package is accompanied by directions telling its use, or a caution against habitual use, nor to the powder of ipecac and powder of opium (commonly known as Dover's powder), or to liniments or ointments containing cocaine or its salts, when plainly labeled "for external use only," and provided further, that the above provisions shall not apply to hospitals, scientific colleges and public institutions, and provided further, that the above provision shall not apply to sales made direct by wholesale houses to hospitals, scientific colleges, public institutions, physicians and dentists.

Article II. That it shall be unlawful for any practitioner of medicine, or dentistry, to furnish to or prescribe for the use of any habitual user of the same, any cocaine, heroine, alpha- or beta-eucaine, opium, or any salt or compound of any of the foregoing substances, or any preparation containing any of the foregoing substances, or their salts, or their compounds, and it shall be unlawful for any practitioner of medicine to prescribe any of the foregoing substances for any person not under his treatment in the regular practice of his profession, provided, however, that this provision shall not be construed to prevent any lawfully authorized practitioner of medicine from furnishing or prescribing in good faith for the use of any habitual user of narcotic drugs who is under his professional care, such substances as he may deem necessary for their treatment, when such prescriptions are not given or substances furnished for the purpose of evading the provisions of this law.

Provided that the above provisions shall not apply to sales at wholesale by wholesale druggists or pharmaceutical manufacturers to retail druggists or lawfully qualified physicians, dentists, or hospitals, scientific colleges or public institutions, and provided further, that the provisions herein against the possession of any of the foregoing substances, or their salts, or their compounds, or any preparation or compound containing the same, except upon either the prescription or order of a lawfully authorized practitioner, shall not apply to wholesale druggists, pharmaceutical manufacturers, retail druggists, lawfully qualified physicians, dentists, hospitals, scientific colleges or public institutions.

Section 1. No prescription shall be refilled which contains any of the following drugs, viz.:

Opium, or its derivatives; cocaine, or its derivatives; chloroform, hyoscyamus and cannabis indica, except preparations containing not more than one-half grain of codeine or heroine to the fluid ounce.

Denver Association.

The annual meeting of the Denver (Col.) Pharmaceutical Association was held January 10th. President C. J. Clayton expressed his disappointment that the past year had not seen more activity. He attributed the lack of growth in the organization to the fact that success or failure of the association was allowed to depend too much upon the officers.

The new officers are: President, C. M. Ford; secretary, F. T. Boutwell; and treasurer, H. F. McCrea.

Fiftieth Birthday of the Philadelphia Drug Exchange.

About 150 persons, representative of all phases of Quaker City drug trade activity, assembled at the Bellevue-Stratford Hotel on the evening of January 27th to commemorate the golden jubilee of the Philadelphia Drug Exchange. There was an informal reception followed by an elaborate banquet, President John Fergusson wielding a jalap tuber as the toastmaster's gavel.

In launching the after-dinner speech-making Mr. Fergusson related briefly the history of the exchange. The first speaker to be introduced was Dr. William Jay Schieffelin, of this city, who as the president of the National Wholesale Druggists' Association conveyed the greetings of that body. The Doctor's speech had to do mostly with the regulation of the traffic in narcotics. He reviewed the legislation, existing and proposed, dealing with this problem and expressed the belief that the traffic would soon be entirely one of "clean hands."

Prof. Joseph P. Remington, the next speaker, dwelt upon the subject of pharmacopoeial revision. It was his opinion that there would be little change in the present standards; and he believed that the outcome of the work of revision would be generally satisfactory. Supplementing his address Prof. Remington read the following original verses:

THE OLD DRUGGIST'S LAMENT TO HIS OLD FRIEND.

In the olden, golden days of yore,
When you and I were young,
We bought and sold, from door to door,
And, played, and danced, and sung.

What mattered it, if stocks were light
With aloes scarce, and market drooping.
We notched the prices up at night
Surely we did all the whooping.

A corner here, a squeeze right there
No cablegrams to bother
We knew our markets to a hair
Just you and I, "well rather!"

The city druggists called on us
Came countrymen to town
They kept us busy selling goods
'Twas great to hold them down.

But then, alas! there came a time,
A time we'll ne'er forget
We warmed our chairs and cooled our feet
And might be waiting yet.

The nimble salesman now goes round
To visit our old set
With smiling face and merry jest
He scoops them in his net.

Costs more, does it, now, than then
To win the welcome orders?
Just advertise now, everywhere, from
Here to West Coast's borders?

That costs too, my worthy friend
Expenses grow apace
You must win in sales and profits
Or drop through empty space.

Cheer up friend, for Spring is coming,
Follow one we prize most highly
Sometimes beaten, ne'er moth-eaten,
Ever youthful Doctor Wiley.

Awake! Awake! trade's flying fast
Through coast, and plain, and mountain range.
No one is old, we rise, we toast
The Philadelphia Drug Exchange.

Albert Plaut, of this city, responded to the toast, "The Obligation of Commercial Organizations." Dr. W. H. Burton, president of Smith College, spoke on "Education and Responsibility." Rev. W. H. Stearley's subject was "Imagination in Business." Mayor Reyburn also spoke.

Philadelphia Association Reaffiliates with N. A. R. D.

At a largely attended meeting of the Philadelphia Association of Retail Druggists, held February 3d, it was decided to renew affiliation with the National Association of Retail Druggists. It was more than a year ago that the Philadelphia association withdrew from the N. A. R. D. Late last year a conference of members of the P. A. R. D. was held. H. W. Merritt, a member of the executive committee of the N. A. R. D., was present. The Philadelphians informed him that certain statements of N. A. R. D. officers which called in question the policies and motives of the men who had favored withdrawal from the N. A.

R. D. would have to be explained and retracted before the association would consider re-affiliation seriously.

At the January meeting of the P. A. R. D. a motion to renew affiliation was laid on the table until, as it was explained, a reply was received as to the intention of the national officers relative to the withdrawal of the charges.

In the latter part of January another conference was held at which H. B. Guilford, of Rochester, N. Y., president of the N. A. R. D., and Mr. Merritt were present. A letter was read from the national executive committee in which the P. A. R. D. was urged to re-affiliate. There was still a doubt as to the attitude of national secretary T. H. Potts and a special committee was authorized to draft a letter to Mr. Potts setting forth the desires of the association for a retraction of the charges made at the time of its secession. This letter was taken to Mr. Potts at Chicago, by Mr. Guilford.

At the February meeting, Secretary Potts' reply was read. Charles Rehfuß, who had been a leader in the secession movement, offered a substitute motion for the one previously tabled. This was unanimously adopted by the association, and is as follows:

Resolved, That we, the P. A. R. D., in regular session assembled, do hereby declare our intention of again renewing our former cordial relations with the N. A. R. D., with a view to again taking our position among the local associations that have contributed so largely to the welfare of the drug trade of this country; and be it further

Resolved, That we hereby express our thanks and believe that the thanks of the entire trade is due President Guilford and Committeeman Merritt for their untiring efforts and success in bringing about this more harmonious condition; and be it further

Resolved, That this association hereby declares its intention to begin its labors in national association work where it left off one year ago and pledges its support to the officers of the N. A. R. D. in their efforts to bring about better trade conditions in the drug business.

At this same meeting the association endorsed the efforts of the Pennsylvania Board of Pharmacy toward securing the labeling of pharmaceuticals in conformity with its interpretation of the State pure-drug law. The association also endorsed a proposed legislative measure which seeks to create a bureau for determining the preliminary educational requirements for prospective pharmacists, dentists and physicians.

Philadelphia College Boys Visit Whitall Tatum Company's Plant.

One hundred and fifty college students can not fail to have a good time when they are on an excursion on their day "off"—and that is exactly what the senior class of the Philadelphia College of Pharmacy had February 16th as the guests of the Whitall Tatum Company, at Millville, N. J. Of course Prof. Remington was along, and he entered into the fun of the occasion as fully and sang the college songs as spiritedly as the boys and girls.

At Millville the visitors were divided into squads and each squad, with a guide, went through the works and saw the process of making bottles and other glassware, from the mixing of the sand to the grinding in of the glass stoppers or the engraving of the fancy figures on the show globes. It all seemed like a magician's shop in fairyland, and as Prof. Remington said to the students, "You'll all have more respect for a bottle now than you ever had before."

A bountiful dinner was served in the middle of the day, and while the usual speech-making feature was eliminated, Prof. Remington said a few words expressive of the appreciation of the guests for the hospitable reception they were enjoying; and Superintendent Bacon, and Benjamin Thorpe, the sales-manager, spoke for the hosts.

This is the sixteenth year that the graduating class of the Philadelphia college—or, as Prof. Remington expresses it, "the class that thinks it is going to graduate"—has visited these works, and there can be no question about the fact that as an educational feature the trip is most valuable.

President Taft has agreed to act as a patron of the Eighth International Congress of Applied Chemistry to be held at Washington, in September, 1912. Mr. Taft will preside at the opening sitting of the congress. Chief Justice White has agreed to preside over the deliberations of the section on jurisprudence.

It is rumored that the United Drug Company, of Boston, will invest more than \$500,000 at Kansas City, Mo., in erecting and stocking a branch manufactory and distributing depot.

Anti-Narcotic Suits at Pittsburg.

Through a special agent the Pennsylvania Board of Pharmacy has for some time been collecting evidence against the illicit venders of narcotics in Pittsburg. Having been quite successful in routing this gentry from Philadelphia, the board tried similar tactics in the "Smoky City," and February 15th representatives of the board and of the local police force gathered in about twenty alleged violators of the anti-narcotic law.

Packages of cocaine, heroine, and morphine, and of Anglo-American catarrh cure alleged to contain 10 grains of cocaine to the ounce, were offered in evidence and their purchase testified to by the special agent of the board. Analyses by State Chemist C. H. LaWall were submitted to prove the character of the substances purchased.

Most of the prisoners were druggists and their employees; against some of them there were three counts. The majority of the infractions were sales of the nostrum named above. All of the accused waived police-court hearings and were remanded for trial under \$500 bail on each count.

It is understood that investigations have been made in other cities and that prosecutions will follow.

Prizes for School Children.

As an off-set to the giving of souvenirs to customers, a practice prevailing among his competitors, M. A. Feinberg, of 259 East Broadway, this city, is attracting the school children of his neighborhood with an offer of prizes to the writers of worthy compositions on subjects selected by a committee of his neighbors. Medals of gold, silver, and bronze are given semi-annually to the successful competitors.

Mr. Feinberg reports that his plan is working well and is gratifying financially as well as giving him a feeling of self-satisfaction different from that of the man whose business motto is "A saucer for a headache, or a tin horse for a backache." He offers to explain his plan to any of his fellows who may consider it worth a trial.

Maryland Trading Stamp Law Invalid.

In a recently handed down decision the Maryland court of appeals declared unconstitutional a legislative enactment regulating the conduct of the trading-stamp business in the State. There were three cases; the trading-stamp companies contended that the requirements and conditions imposed by the act practically prohibited the issue of stamps.

The opinion holds broadly that the present manner of conducting the trading-stamp business does not involve such chance and uncertainty as to arouse the gaming or gambling spirit.

Madame Curie Not Yet an Academician.

Mme. Curie, who with her husband, the late Prof. Curie, discovered radium, has been defeated in her candidacy for membership in the Academy of Sciences, receiving 28 votes against 30 for Edouard Branly. Her candidacy for the seat in the academy once occupied by her husband has attracted much attention, as the only obstacle to her election has been the fact that she is a woman. Her brilliant work in scientific research is everywhere recognized as placing her in the front rank of scientists. In the discovery of radium she is generally admitted to have had a greater part than had her husband.

In reporting a court trial occurring at Cambridge, Mass., some eleven months ago the New York *World* so referred to the testimony of Albert H. Hamilton, of Auburn, N. Y., a handwriting expert, as to bring about a suit for libel. Mr. Hamilton asked for \$35,000 damages. A jury at Auburn, January 25th, awarded damages of \$15,000. The Judge denied the subsequent motion to set aside the verdict; and the case, it is stated, will be taken to the appellate court.

The Scholtz Drug Stores (there are six of them) of Denver, Colo., celebrated the thirtieth anniversary of their beginning, in January. An advertisement occupying about five-sixths of a page in a setting of reading matter was run in the Denver *Republican*, for January 15th, announcing the event and telling about the special low prices that would prevail during that week.

Two Successful Chicagoans.

Success consists of getting what one goes after. This, at least, is the popular conception of the meaning of the word. Men are successful in different ways—some in business, some in politics, some in reaching high professional positions, and some in still other directions. Here, then, follow brief chronicles of two young men of the great Windy City who are successful along somewhat different lines, both of whom will doubtless achieve a greater measure of success as the years roll by.

Prof. Albert H. Clark.

Notwithstanding the fact that he lives in Chicago, Prof. Albert Henry Clark is a quiet, unobtrusive young man with a studious mein. Perhaps he is wondering how he is to fill the place made vacant by the retirement of Prof. W. A. Puckner from the chair of chemistry in the department of pharmacy of the University of Illinois, for Prof. Puckner left a large vacancy when he quit the po-

A. H. CLARK.

E. H. LADISH.

sition; and that other large vacancy left in the pharmacopœial revision committee by the death of Prof. Hallberg.

Just why Prof. Clark chose Marengo, Ill., as a birthplace is not definitely known, but it has been suggested that it was because he would have less competition in his endeavor to make a small place famous than to make an already famous one more so. His first act to add to the fame of Marengo was performed October 15th, 1871, and he is now engaged in a continuous performance to that end; but as noted in the first place, he goes light on the brass instruments and uses no slap-sticks.

When fifteen years of age the future professor had attended grammar and high schools at Marshall and Robinson, in his native State, and succumbed to the lure of the colored lights, the opportunity to chew an unlimited supply of licorice sticks, and the mystery of the prescription case, and secured a position as clerk in the drug store of P. L. Brand, of Marshall. The young man entered the Chicago College of Pharmacy in 1891 and was graduated with the close of 1904. This is not a typographical error, neither must it be understood that it took Mr. Clark thirteen years of hard study to complete the course which other young men finished in two or three. The answer is this: In the spring of 1893 he received an offer of a position in the store of R. N. Dodds, of Springfield, Ill., which he accepted, and did not return to college until just ten years thereafter. He took high honors at the commencement the next year, and walked off with the Becker prize for the best work in pharmacy done by any member of the class.

The Searle & Hereth Company captured him, and shortly thereafter, to wit, in 1905, he was appointed instructor in chemistry at his alma mater.

Prof. Clark is active in association work, and is now the chairman of the scientific section of the American Pharmaceutical Association. He is a member of the American Chemical Society, the Illinois Pharmaceutical Association, his alumni association, a club or two, and as noted in the CIRCULAR for last month, has been elected to fill the vacancy on the committee of revision of the United States Pharmacopœia made vacant by the death of Prof. Hallberg.

Prof. Clark has done some good work in chemistry and has contributed the results of much of it to the current literature on the subject.

E. H. Ladish.

Some pronounce the name of this man as if it were Ladish—like boy-ish—and others pronounce it La-dish, making it sound like something good to eat, while still others (as well as some of the same) cut the Gordian knot by pronouncing him a live wire, and let it go at that. And he is, whether performing as a member of the American Pharmaceutical Association, a section chairmanship in which he declined, or as a N.-A.-R.-D.-er, or as a "purveyor of everything for the care of the sick" in his store at the corner of Larrabee and Center streets.

Mr. Ladish is a near-German, having been born at Milwaukee, and also of German parents. This was March 31st, 1873. When sixteen years of age he had had experience in a denominational school, the public schools, and a night school, so he began his education in another and quite famous institution of learning, the drug store. He was an apt pupil, and while he is not yet a full graduate, he is among the leaders in his class. After clerking for two or three concerns in his native city, Mr. Ladish went to Chicago and gained still further knowledge of the business, and when only twenty-six bought the store of his employer, Herman Fry, in which he has been at work, more or less, usually more, ever since. Once he tried a branch store, but sold this in order to concentrate his fire.

This strong convention man had never attended a large gathering of pharmacists in his life until he went to Boston in 1905 to be present at the meeting of the National Association of Retail Druggists, and since then he has never missed a large gathering of pharmacists if it were possible for him to get away and go to it, and declares he never will so long as he has the price and the health. In 1908 he was made a member of the executive committee of the N. A. R. D., and was re-elected the following year.

Mr. Ladish is what is popularly known in baseball circles as a "fan," and he is very fond of good music and good books. The fellow who keeps the corner grocery not far from the Ladish store once gave utterance to this sapient remark: "W'en t'ings go wrong mit me I get a chag on; when Ladish is sore over somethings he puya a set of books, or a clock or a cash register." Reader, go thou and do likewise.

Dentists in the Navy.

According to press dispatches from Washington, Uncle Sam's bluejackets and fighting ships may have to show their teeth to an enemy some day. So the long-headed house committee on naval affairs favors the establishment of a dental corps in the navy. A bill to that effect has been introduced and will doubtless become a law if all the dentists in the country will plug it along, as the slangy say.

The bill creates a corps of thirty dentists. The age limit for entrance is from twenty-four to thirty-two years. Each applicant will be appointed on his merits, but he must have a professional pull, of course. At the end of eleven years, by the naval system of promotion, the thirty will have resolved themselves automatically into one lieutenant commander, four passed assistant surgeons and twenty-five assistant surgeons.

Uncle Sam gives his sailormen ice cream for dinner three times a week. The hardest tar cannot enjoy ice cream if an exposed nerve is throbbing in one of his molars. The ship's dentist will keep the crew's teeth well filled and well filed. Also, presumably, the marine dental surgeons will sharpen the eye teeth and wisdom teeth of naval apprentices, so that they will learn quicker that a ship's port and starboard lights are not lamps in a drug store window.

If a man-o'-war is sailing in the teeth of the wind the dentist aboard can act as navigator, and if a wave destroys her bridge he can supply a new one easily. If a cruiser gets in the doldrums the passed assistant surgeon can give her nitrous oxide gas and make her laugh. There will be a thousand uses for dentists in the navy.

Prof. Goodman of the School of Pharmacy of the University of Illinois has presented to the school an oil portrait of the late Prof. Hallberg. Prof. Goodman is the artist.

Cleveland Medico-Pharmaceutical Section.

What was perhaps the most satisfactory meeting ever held by the Medico-Pharmaceutical Section of the Cleveland (Ohio) Academy of Medicine occurred January 27th.

The first business transacted was the annual election which resulted in the reseat of L. C. Hopp, as chairman; M. G. Tielke, as vice-chairman; and Dr. J. B. McGee as secretary; Dr. Nathan Rosewater was elected a member of the council of the academy to represent the section.

Dr. Rosewater read the report of the committee appointed a year ago to consider the advisability of using saccharin in pharmaceuticals. He stated that four out of the five members of the committee were of the opinion that the use of saccharin as a sweetener was unobjectionable, unless deception was practiced. Dr. Rosewater reported he had personally taken 60 grains of saccharin in divided doses during one evening and experienced absolutely no deleterious effects. [It should be noted that the effect of continued use is not considered here, nor is its effect even in small quantities on debilitated persons.] It was decided that in view of the expected report of the Remsen referee board relative to saccharin the section would take no action on the report before it other than to receive it and discharge the committee with thanks.

The two papers of the evening were: "Ointments from the Pharmaceutical Side," by L. C. Hopp; and "Ointments from the Therapeutical Side," by Dr. W. T. Corlett.

Mr. Hopp outlined the work thus far done by sub-committee 12, of the U. S. P. revision committee, with a view to securing opinions of the medical men. He spoke of the proposition to drop the cerate group and the advisability of getting recipes for several ointment bases: simple ointment, a wool-fat petrolatum base, a base similar to cold cream. He objected to the recognition of a 33 per cent. mercurial ointment in addition to the 50 per cent. product. He considered the 10 per cent. ointments of the two oxides of mercury too strong; and thought that the ointment of phenol was unsatisfactory, both as to base and strength.

Dr. Corlett, a prominent dermatologist, outlined the history of ointments, and classified them into (a) protective, (b) astringent, (c) stimulating, (d) antiseptic, and (e) penetrative. He emphasized that these several results can be obtained only by intelligent choice of the base: Petrolatum, for protective ointments; wool-fat for penetrative ointments; for astringent ointments, wool-fat-petrolatum; for stimulating ointments, wool-fat-lard; and for antiseptic ointments, a petrolatum-lard combination. He said that he had tried all the modern substitutes for ointments: pastes, pencils, mulls, etc., and had come to the conclusion that after all, ointments are the most reliable products for skin medication.

In the discussion that followed the papers it was pointed out that in Ohio at least, no product bearing a pharmacopoeial name could be sold unless of pharmacopoeial strength and that as the 33 per cent. mercurial ointment containing petrolatum was intended solely as a non-absorbent vermin killer, while the 50 per cent. form was intended to be absorbed to obtain the constitutional effects of mercury, the two served entirely different purposes, and each supplied a marked need.

The suggestion to drop the class of cerates met with general approval.

It was recommended that both ointments of the oxides of mercury be dropped in revising the Pharmacopoeia, leaving the physician to prescribe strength and base.

Ohio Druggists Banquet Physicians.

The Ohio Valley Druggists' Association, of Cincinnati, demonstrated its activity on the evening of January 18th, when it entertained the local members of the medical profession, at a banquet. This affair, it was generally conceded, was one of the most successful in the history of the association. The dinner was an elaborate one and the guests numbered about four hundred, three-fourths of whom were prominent physicians of Cincinnati and nearby cities.

President Kutchbauch of the O. V. D. A. introduced as toastmaster Prof. John Uri Lloyd, who after one of his characteristic talks called up Mayor Schwab, who is a physician and pharmacist. The Mayor spoke of the real need for a closer and better relationship between the two professions.

Dr. Frederick Forchheimer, the next to respond, reviewed the changes which had taken place in pharmacy

and dwelt on the necessity of coming back to first principles. He urged pharmacists not to fall into commercialism.

Secretary Thomas H. Potts, of the National Association of Retail Druggists, was present as a guest of honor and set forth his reasons why a closer relationship was desirable and necessary between doctor and druggist. He was of the opinion that the druggist was not alone to blame for the present conditions.

Prof. James H. Beal, of Scio, Ohio, spoke of the benefits to public welfare through co-operation of the several branches of the healing profession. He also called attention to the necessity of laws to restrict the activity of itinerant vendors of medicines.

Dr. C. A. L. Reed, a strong advocate of a national bureau of health, made this his topic. He did not favor the recently introduced Mann bill to enlarge the public health bureau of the treasury department.

Other speakers were Dr. Charles L. Bonifield; Prof. W. C. Anderson, of Brooklyn, N. Y.; and F. W. Kisker, of Cincinnati.

Ethical Drug Stores.*

By E. W. WATSON, M. D.

Some one queries, "What is an ethical drug store?" Ethical preparations we know. They are, for the most part, urged upon our notice by manufacturing drug firms and the name of their assiduous agents is legion; they come when we are most busy and we cast them out. Ethical prescriptions are prescriptions calling for one or more samples, compounded to order by a reputable pharmacist, made agreeable, if you wish, by flavors and syrups and innocent elixirs; but ethical drug stores? Surely, one can picture them in the optic of the mind; we can call up a sample at will. There are cut-glass bottles of chaste design in the front windows, containing colored liquids, as is the custom and sign manual of the drug store of old, but the colors are more refined and the fluids in the bottles are free from fungus and deposit. There is no other display in the window save a draping of soft purple or rich maroon velvet for a background. Inside we enter a reception room whose marble floor is spotless unless it rains and the streets are muddy. There are cases at the sides, but their contents are never conspicuous, being articles of real worth and necessity, tooth-brushes and hair-brushes and soaps of rare aroma, genuine imported perfumes, all these and many like articles lurk modestly in the shadows, never flaunting their virtues.

A table stands in the center spread with recent magazines of the most select type where the weary waiter, sinking into one of the comfortable chairs can find, in literature, relief from the tedium of delay (generally, however, the prescriptions are sent home by messenger). There is no soda-water fountain and no assiduous fly, but at the rear hang heavy curtains of Eastern stuff shutting out alike the pounding of pestle, the clink of glass, and the clatter of tongues. They add solemnity to the waiting-room and mystery to all beyond it; life and death lurking, as it were, behind their heavy folds.

If voices come to us, they are mysterious and muffled, if unethical preparations lie in wait there they are at least unseen; if mistakes are made we shall never know it. In short, when the bottle or the box of pills appears, neatly wrapped, there is about it a subtle aroma of secrecy which in these days of mental science undoubtedly enhances their therapeutic value. Such is the ethical drug store. The purple hangings swing sadly apart, and the proprietor of all this studied simplicity and stern conformity to ethical principle stands revealed; a being not quite a philosopher yet greater than an undertaker; a Delphic oracle of the gentler sort, in voice and mien, the genius of it all, the real Ethical Pharmacist.

In a recent issue of a newspaper of his city W. M. Bartlett, of Salem, Mass., advertised his "apothecary shop" as "a real drug store where prescription work of the highest grade is a specialty, and is justly given that recognition and prominence which its great importance demands—our entire time and undivided attention are given solely to compounding and dispensing the best quality of drugs and medicines. We are therefore perfectly free from the incubance of the above-named 'side lines' which have always seemed to us to have no more place in a drug store than tailoring has in a doctor's office."

*From Medical Notes and Queries.

A Wail from a Rhymer.*

Sure, 'tis one big drop that has hit this shop
 Since the winter of 'eighty-nine,
 When I landed here with full joyous cheer
 A snug little fortune to find—
 Which same, I regret, has even as yet
 Eluded this skill'd grasp of mine.

I could mixtures shake and smooth plasters make
 And roll out a slick, shiny pill;
 But trade-custom tricks proved a mussy fix
 That entangled me 'gainst my will—
 I, being a "grad" became somewhat sad
 When ethics they threatened to kill.

Mechanic-made pills are causing us ills
 By chasing pill-rolling away;
 We buy these by tons—and sell 'em by ones
 Since sickness no longer's au fait.
 And so-styled "Science," likewise, "Reliance,"
 Have aided finances to sway.

Then, too, there are laws with more or less flaws
 Our trafficking to regulate.
 Still faker and quack with hook and with knack
 The man and the coin separate.
 Yea, any old hoax e'en porkers in pokes,
 Afford that about which they prate.

They juggle the sick with many a trick.
 From A through the whole line to Z.
 They make folks believe and then they deceive
 Their credulous mentality.
 Yes; it's one big drop that has hit this shop
 Since I 'listed in pharmacy.

The Montgomery County (Pa.) Retail Druggists' Association recently elected the following officers for the year: President, W. H. Read, of Norristown; vice-presidents, M. M. Osborne, of Elkins Park; and Theodore Jacobs, of Norristown; secretary, L. W. S. Jones, of Norristown; treasurer, S. K. Geagle, of Norristown; executive committee, John Gearhardt, T. F. McCoy, John Donnelly, and F. W. Prichet.

The Milwaukee Pharmaceutical Association held its annual meeting and election of officers, February 2d. S. A. Eckstein was re-elected president. His associate officers are: Vice-president, J. H. Schmitt; secretary, W. F. Kaiser; treasurer, L. H. Kressin; members of the executive committee, L. G. Mack, J. H. Schmitt, Theodore Biederman, Peter Glycz, J. J. Posschl, W. F. Kaiser, and Otto Hackendahl.

The annual meeting of the St. Louis Retail Druggists' Association was held January 17th. Officers were elected as follows: President, H. O. A. Huegel; vice-presidents, J. M. Good and J. A. Fritz; treasurer, George Hausgen; secretary, C. W. Stockhausen; field secretary, E. A. Sennewald; directors, A. W. Pauley, O. F. Traubel, E. H. Wolff, O. J. Cloughly, and Dr. W. A. Hoelscher.

At the annual meeting of the Minneapolis Retail Druggists' Association, held January 19th, officers were elected as follows: President, Truman Griffin; vice-president, Sherman Brownlee; treasurer, Otto Graben; secretary, E. A. Klenert; and members of the executive committee, Thomas Voegeli, C. H. Huhn, John Danek, A. J. Kline, and A. D. Thompson.

The Rochester (N. Y.) Pharmaceutical Association held its annual meeting January 6th. Officers for the ensuing year were elected as follows: President, E. E. Chilson; vice-president, George Hahn; secretary, J. E. Cooney; and treasurer, C. W. Peck.

J. K. Lilly, president of Eli Lilly & Co., of Indianapolis, was entertained at dinner on the evening of January 23d, by the heads of the departments of the home office. The occasion was the eve of Mr. Lilly's departure for a pleasure trip to the Mediterranean.

P. W. Snyder, of Hollidaysburg, Pa., a member of the executive committee of the Pennsylvania Pharmaceutical Association, is now a member of the State legislature.

*This rhymed bewailing of conditions in the gentle art of pharmacy is from the pen of a druggist of this city who, like many of his fellows, has been discomfited by the present-day trend of things pharmacial.

Pharmacy's Needs.*

At the present time, what is needed more than anything else in North Dakota, is a law requiring every person to register the medicine intended to be sold by a non-registered pharmacist. Let this registration be made in each county in the State. Let no license be granted so long as this product is in violation of our present drug or beverage laws, or where fraud or deception is being practiced, or where exaggerated, unwarranted and false claims are made with regard to the properties or use of any drug or medicine intended to be sold in the State.

We do not need more drug stores. We need more efficient help in our stores and less competition. There is hardly a town with two or more drug stores where one would not serve the public better than the two and be able to carry a larger and better line and employ more efficient help. We need more competent assistants, not more registered druggists. We need greater efficiency, less competition and better public service. This can be made possible only when we have the necessary legislation raising the standard for registered pharmacists.

Planning for the Silver Jubilee of the Northwestern School.

The twenty-fifth anniversary of the founding of the Northwestern University School of Pharmacy and the completion of the twenty-fifth year of Prof. Oscar Oldberg's incumbency as dean of the school will be celebrated early in April. It is planned to make the occasion a "homecoming week" for alumni and former students and it is expected that every class will be well represented. The alumni are raising a fund to be used in providing a permanent memorial to commemorate this event in the school's history.

What We Drink, Smoke and Chew.

According to records kept by the United States internal revenue bureau, we consumed in this country during the last fiscal year 163,000,000 gallons of distilled spirits, 30,000,000 gallons more than the year before; 59,485,117 barrels of fermented liquors, an increase of 3,000,000 barrels; 7,600,000,000 cigars, 160,000,000 more than the previous year; 6,830,000,000 cigarettes, an increase of 1,000,000,000 "coffin nails"; and 402,000,000 pounds of plug, fine-cut, cube-cut, granulated, or sliced smoking or chewing tobacco or snuff, 4,000,000 pounds more than the year before.

By the way, what kind of a country did "Uncle Joe" Cannon say this was?

Boston Association.

The thirty-sixth annual dinner meeting of the Boston Association of Retail Druggists was held on the evening of January 24th. Among the guests of the association were State Treasurer E. A. Stevens and Hon. Charles V. Blanchard.

Officers for the ensuing year were elected as follows: President, J. Arthur Bean; treasurer, J. H. Ingraham; secretary, H. C. Wiggin; members of the executive committee, E. H. La Pierre, H. W. Bowman, F. L. Carter, Jr., H. A. Estabrook, P. B. Thompson, J. W. Lowe, and J. R. Sawyer; membership committee, A. H. Bartlett, A. M. Dow, J. O. Jordan, W. F. Sawyer, and G. E. Hodges.

Consular advices from Lisbon, Portugal, are to the effect that by a provisional decree issued September 28th, last, the exportation from that country of cork in an unmanufactured state is prohibited. This decree is intended to improve the condition of the domestic cork industry. By a decision of November 7th, the prohibition is to apply to all cork, unless boiled or scraped and cut out and carefully packed.

Over one hundred doctors and druggists were present at the third annual banquet of the Vigo County (Ind.) Retail Druggists' Association and the Vigo County Medical Society, held at Terre Haute, January 23d. The druggists were the hosts. Vaudeville acts, motion pictures, and music were provided for the entertainment of the guests. The doctors are planning to entertain the druggists in the near future.

News of the Pharmacy Boards.

List of Board Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

ALABAMA—E. P. Galt, Selma.
ARIZONA—April 12th, at Phoenix. A. G. Hulett, Phoenix.
ARKANSAS—May 8th, at Little Rock. J. F. Dowdy, Little Rock.
CALIFORNIA—Louis Zeh, San Francisco.
COLORADO—March 17th and 18th, at Denver. S. L. Bresler, Denver.
CONNECTICUT—March 7th, at Hartford. J. A. Leverty, Bridgeport.
DELAWARE—April 4th, at Newark. Albert Dougherty, Wilmington.
DISTRICT OF COLUMBIA—April 13th and 14th, at Washington. S. L. Hilton, Washington.
FLORIDA—D. W. Ramsaur, Palatka.
GEORGIA—C. D. Jordan, Monticello.
IDAHO—April 11th, at Idaho Falls. J. M. Starrh, Shoshone.
ILLINOIS—March 7th, at Chicago. F. C. Dodds, Springfield.
INDIANA—April 11th and 12th, at Indianapolis. W. H. Rudder, Salem.
IOWA—April 4th, at Des Moines. E. J. Moore, Des Moines.
KANSAS—W. E. Sherriff, Ellsworth.
KENTUCKY—April 11th and 12th, at Louisville. J. W. Gayle, Frankfort.
LOUISIANA—May 9th to 11th, at New Orleans. F. A. Earhart, New Orleans.
MAINE—April 12th and 13th, at Augusta. F. W. Bucknam, Skowhegan.
MARYLAND—April 12th and 13th, at Baltimore. Ephraim Bacon, Roland Park.
MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.
MICHIGAN—March 21st to 23d, at Grand Rapids. E. J. Rodgers, Port Huron.
MINNESOTA—April 18th, at Minneapolis. C. T. Heller, St. Paul.
MISSISSIPPI—April 4th, at Jackson. L. H. Wilkinson, Greenwood.
MISSOURI—March 13th, at Springfield. C. E. Zinn, Kansas City.
MONTANA—T. M. Kehoe, Billings.
NEBRASKA—A. V. Pease, Fairbury.
NEVADA—May 3d, at Reno. R. L. Prouty, Tonopah.
NEW HAMPSHIRE—March 29th, at Nashua. F. H. Wingate, Nashua.
NEW JERSEY—April 20th, at Trenton. H. A. Jorden, Bridgeton.
NEW MEXICO—A. J. Fisher, Santa Fe.
NEW YORK—May 24th and 25th, at New York, Albany and Buffalo. W. L. Bradt, Albany.
NORTH CAROLINA—F. W. Hancock, Oxford.
NORTH DAKOTA—March 20th, at Fargo. W. S. Parker, Lisbon.
OHIO—June 20th to 23d, at Columbus. F. H. Frost, Columbus.
OKLAHOMA—April 11th and 12th, at Oklahoma City. J. C. Burton, Stroud.
OREGON—March 14th and 15th, at Salem. C. G. Huntley, Oregon City.
PENNSYLVANIA—L. L. Walton, Williamsport.
RHODE ISLAND—March 7th, at Providence. J. E. Brennan, Pawtucket.
SOUTH CAROLINA—March 15th, at Charleston. F. M. Smith, Charleston.
SOUTH DAKOTA—April —, at Brookings. E. C. Bent, Dell Rapids.
TENNESSEE—April 18th, at Memphis. I. B. Clark, Nashville.
TEXAS—R. H. Walker, Gonzales.
UTAH—April 18th and 19th, at Salt Lake City. W. H. Dayton, Salt Lake.
VERMONT—D. F. Davis, Barre.
VIRGINIA—April 25th, at Richmond. T. A. Miller, Richmond.
WASHINGTON—P. Jensen, Tacoma.
WEST VIRGINIA—May 5th and 6th, at Wheeling. A. Walker, Sutton.

WISCONSIN—April 11th and 12th, at Madison. Edward Williams, Madison.
WYOMING—C. B. Gunnell, Evanston.

Florida Board.

At a meeting of the Florida Board of Pharmacy, held at St. Augustine, January 24th and 25th, officers were elected as follows: President, E. Berger, of Tampa; vice-president, Leon Hale, of Tampa; secretary and treasurer, D. W. Ramsaur, of Palatka. The other members of the board are H. H. D'Alemberte, of Pensacola; and W. D. Jones, of Jacksonville.

Resolutions were adopted urging the better enforcement of the State pharmacy law. Several amendments to the present law were proposed and will be presented at the coming meeting of the State legislature.

Fourteen applicants for registration were examined at this meeting.

Illinois Board.

At the January meeting of the Illinois Board of Pharmacy, held at Springfield, sixteen of the fifty-two applicants for registration as pharmacists; eleven of the twenty-one candidates for assistants' licenses and the only applicant for local registration passed the examinations. Their names follow:

As pharmacists—J. M. Dodd, J. F. Hayes, A. W. Hotz, B. J. Hourigan, Wladislave Hoyer, Barney Kite, Frank Lypski, E. B. McCann, E. L. Miles, A. H. Williams, and Otto Zeman, all of Chicago; J. B. Anderson, of Peoria; E. H. Elder, of Decatur; Otto Hohenstein, of Bloomington; Andrew Richmond, of Waukegan; and J. H. Stewart, of La Grange.

As assistants—Clifford Akers, of Taylorville; Sister Bernardine, of Springfield; C. H. Chase, of Effingham; Casimir Czbanski, of Chicago; V. C. Dowling, and Sister Eusebie, both of Springfield; Mahlon Hess, Jr., of Kankakee; Mrs. Edith Mitchell, of Clinton; C. V. Retzky, of Chicago; and P. H. Sheridan and C. J. Strubel, both of Alton.

Local registration was granted to L. A. Ducharme, of St. Anne.

The next meeting of the board will be held at Chicago, March 7th.

Iowa Board.

Of a class of sixty applicants for registration examined by the Iowa Board of Pharmacy December 6th, at Des Moines, the following twenty-one were successful:

Ulysses Cary and C. H. Crewse, both of Des Moines; H. J. Cunningham, of Dyersville; O. C. Fleener, of Clarinda; David Gildstein and J. J. Glenn, both of Des Moines; J. W. Hanson, of Kensett; John Heerema, of Pella; H. E. Henneberg, of Des Moines; W. J. Hilmer, of Waterloo; Oscar Hufford, of Des Moines; C. H. Jones, of Ottumwa; C. W. Leafstone, of Sioux City; A. F. Lohr and B. R. Murphy, both of Des Moines; L. E. Page, of Central City; H. M. Sale, of Afton; C. M. Serbein, of Maxwell; H. B. Storm, of Grinnell; W. M. Sutter, of Storm Lake; and J. M. Wheeler, of Marshalltown.

Kentucky Board.

Examinations were conducted by the Kentucky Board of Pharmacy January 11th and 12th, at Covington. There were fourteen applicants for registration of whom the following were successful:

As pharmacists—G. G. Howell, of Columbus, Ohio; W. H. Mahood, of Catlettsburg; J. E. Meacham, of Sturgis; and G. V. Theobald, of Williamstown.

As assistants—J. F. Conwell, of Covington; G. J. Ellis, of Glasgow; E. C. Klein and A. W. Ross, both of Cincinnati, Ohio; and T. P. Taylor, Jr., of Louisville.

The next meeting of the board will be held at Louisville, April 11th and 12th.

Massachusetts Board.

Three examinations were conducted during the month of January by the Massachusetts Board of Pharmacy. Forty-six applicants in all were examined for registration. Twelve were successful as pharmacists and eight as assistants. Their names are:

As pharmacists—G. J. Boucher, of Fall River; C. L. Cordeau, of Lowell; H. J. Duffy and R. T. Fournier, both of

Fall River; Adolph Gorshel, of Chelsea; R. M. Hayward, of Stoughton; A. L. Marcoux and G. F. Martin, both of New Bedford; N. H. Nevler, of Boston; P. M. Smith, of Worcester; and Joel Weiner and W. D. Wheeler, both of Boston.

As assistants—Nathan Arkus, of Worcester; E. E. Beauvais, of Holyoke; T. C. Blondeau, of Auburn; E. F. Houle, of Lowell; J. T. Lindley, of Melrose; F. C. Reeves, of Boston; T. E. Soucy, of Taunton; and E. S. Troupin, of Worcester.

Michigan Board.

Examinations were held by the Michigan Board of Pharmacy, at Ann Arbor, January 17th to 19th. Fourteen applicants for registration as pharmacists and twelve candidates for assistants' certificates were successful. They are as follows:

As pharmacists—Emily Burt, of Blanchard; H. W. Goodspeed, of Lansing; A. L. Gray, of Bay City; L. P. Heeres, of Muskegon; R. W. Johnson, of Three Rivers; T. C. Lee, of Grand Rapids; G. W. Lindstrom, of Muskegon; N. A. Liponetzky, of Detroit; R. H. Lloyd, of Columbiaville; L. T. Mans, of Kalamazoo; R. C. Morris, of Detroit; E. M. Snyder, of Mecosta; R. E. Walker, of Marlette; and N. J. Winslow, of Cass City.

As assistants—B. S. Barker, of Caledonia; G. E. Bowels, E. H. Couborn, and N. A. Dodson, all of Detroit; G. A. Fitch, of Thompson; F. M. Gibson, of Millington; H. C. Millman, of Ann Arbor; F. W. Norton, of Tower; M. J. Richert, of Saginaw; C. A. Smith, of Three Rivers; E. H. Torman, of Detroit; and G. R. Whitney, of Rose City.

The next meeting of the board will be held at Grand Rapids, March 21st to 23d.

Minnesota Board.

Seventy-one applicants for registration were examined at a meeting of the Minnesota Board of Pharmacy held in January, at Minneapolis. The following passed:

As pharmacists—D. C. Alcott, of St. Paul; James Baillie, of Minneapolis; W. M. Humphries, of Moorhead; and J. J. Mausback, of Little Falls.

As assistants—T. G. Arneson, of Montevideo; F. J. De Cock, of St. Paul; R. G. Gash and T. A. Nash, both of Minneapolis; R. E. Ohm, of Brainerd; Harry Sansby, of St. Paul; C. J. Yoho, of Minneapolis; and D. W. Zierke, of Hutchinson.

This being the annual meeting of the board, officers were elected as follows: President, Robert L. Morland, of Worthington; and secretary, Charles T. Heller, of St. Paul.

The next meeting will be held during the week beginning April 17th.

New Hampshire Board.

A regular meeting of the New Hampshire Board of Pharmacy was held January 25th, at Nashua. Of fourteen applicants for registration, the following were successful:

J. B. Gorman, of Dover; J. G. Gregorie, of Manchester; P. E. Picard, of Nashua; and E. R. Wadleigh, of Lancaster.

The next meeting of the board will be held at Nashua, February 22d.

New Jersey Board.

The New Jersey Board of Pharmacy met at Trenton January 19th and 20th. There were twenty-nine successful applicants for registration as pharmacists and fourteen as assistants. They are:

As pharmacists—L. C. Arnold, of Newark; R. J. Brown, of Trenton; J. H. Bynum, of Atlantic City; Wayne Cadwallader, of Newark; L. E. Christopher, of Philadelphia, Pa.; F. B. Coulbourn, of Westtown, Pa.; H. W. Davey, of Long Branch; Alfonso De Mercurio and F. W. Engel, both of New York, N. Y.; F. B. Fee, of Elizabeth; M. W. Friedman and Anna Goldberg, both of Newark; J. L. Hackenberger and H. S. Hughes, both of Trenton; A. A. Karlin, of New York, N. Y.; W. C. Lloyd, of South Orange; Joseph Menitove, of Jersey City; N. G. Minton, of Brooklyn; D. A. Monheit and F. T. Ogden, both of New York, N. Y.; Max Rosenthal, of Newark; Harris Schlesinger, of New York, N. Y.; W. S. Sigler, of Newark; J. A. Stackhouse, of Asbury Park; H. J. Stockhoff, of Rutherford; E. K. Stratton, of Salem; Emanuel Weiss, of Newark; J. R. Young, of Morristown; and Jacob Zimmer, of Perth Amboy.

As assistants—Abram Abelsky, of Jersey City; H. LaD.

Blow, of Collingdale, Pa.; Rudolph Breitenfeld, of Hoboken; Raymond Flett, of Atlantic Highlands; George Freeman, of Trenton; C. F. Hoffman, of Hoboken; Lewis Horwitz, of Bayonne; W. G. Kroemmelbein, of Elizabeth; Ambrose Pancoast, of Millville; G. H. Sleator, of Atlantic City; T. R. Stephan, of Trenton; Frederick Theile, of West Hoboken; R. F. Tyler, of Atlantic City; and Claude Van De Mark, of Harrison.

The next meeting of the board will be held at Trenton, April 20th and 21st.

Ohio Board.

The Ohio Board of Pharmacy at a meeting held at Columbus, January 10th and 11th, examined one hundred and six applicants for registration. Forty-five were successful as pharmacists and nineteen as assistants. The names are:

As pharmacists—H. A. Anderson, of Tiffin; A. J. Bohrer, of Leipsic; W. L. Colloredo, of Waynesburg; A. H. Craig, of Warren; Gilbert Crawford, of Cleveland; R. L. Crowe, of Caruthersville, Mo.; J. B. Day, of Findlay; D. F. Davis, of Newark; C. O. Ewing, of Carey; A. H. Finley, of Washington Court House; M. N. Ford, of Delphos; O. M. Foust and Emma W. Gaertner, both of Toledo; D. C. Giffin, of Ashland; H. R. Gilson, of Steubenville; H. F. Hagedorn and A. E. Hagedorn, both of Cleveland; G. F. Hart, of Newark; Harry Haverkamp, of Cincinnati; H. H. Hirsland, of Napoleon; H. H. Hord, of Columbus; F. A. Horn, of Dayton; J. A. Kurlander, of Cleveland; J. W. Lafferty, of Sharon, Pa.; Edward Lindeman, of Cincinnati; W. E. Luthy, of Cleveland; O. R. Moore, of Mingo Junction; J. H. Neal, of Gallipolis; K. D. Petrie, of Celina; Frank Porembski, of East Youngstown; C. V. Purvis, of Payne; G. A. Reynolds, of Akron; Otto Rhine, of Wapakoneta; F. L. Schulkers, of Covington; A. C. Serra, of Cleveland; M. F. Shaff, of Napoleon; O. S. Simpson, of Arcanum; I. P. Smith, of Youngstown; C. P. Sohn, of Allegheny; J. F. Starner, of Mt. Vernon; G. G. Strenick and O. O. Wentling, both of Ada; G. H. Wilson, of Columbus; C. J. Vortkamp, of Lima; and H. C. Zimmerman, of Dayton.

As assistants—L. W. Alexander, of Cincinnati; F. L. Borden, of Cleveland; C. E. Brown, of Marietta; Fuller Butler, of Urbana; F. W. Clingan, of Columbus; F. H. Copernoll, of Toledo; Mary B. De Lee, of Covington; H. H. Kennedy, of Columbus; E. W. Kobath, of Oak Harbor; W. C. McManigal, of Logan; G. B. Morse, of Columbus; B. E. Newton, of Newcomerstown; E. A. Orwig, of Toledo; E. R. Roller, of Cleveland; William Schultz, Jr., of St. Bernard; Estel E. Shaffer, of Bidwell; F. E. Swartz and G. E. Turner, both of Columbus; and J. C. Weik, of Hamilton.

The next examination of the board will be held June 20th to 23d, at Columbus.

Oklahoma Board.

A regular quarterly meeting of the Oklahoma Board of Pharmacy was held January 10th and 11th, at Oklahoma City. Thirty-two candidates were examined; and the following were successful:

C. B. Baker and H. M. Bennett, both of Norman; F. R. Deans, of Fairfield; C. W. Holderman, of Pawnee; J. R. Kimbrough, of Oklahoma City; W. G. Maurer, of El Reno; R. W. Quackenbush and R. I. Roby, both of Wichita; D. E. White, of Asher; and A. R. Wilson, of Wynnewood.

The following received certificates as pharmacists without being examined, by virtue of their having been graduated by schools of pharmacy recognized by the board:

D. D. Bliven, of Hennessey; B. L. Brenner, of Rensselaer, Ind.; A. B. Clark, of Delta, Colo.; Cottie Cleeton, of Higbee, Mo.; Mira J. Cook, of Red Cloud, Neb.; A. J. Day, of Satartia, Miss.; C. W. Ermey, of Tulsa; E. E. Fabiano, of Kansas City; T. J. Fatherrel, Jr., of Natchez, Miss.; Alva Fisher, of Lentz, Ore.; J. H. Forrest, of South Omaha, Neb.; J. H. Freedman, of Kansas City, Mo.; B. F. Gilbert, of Natchez, Miss.; Ora E. Goldsmith, of Geary, Ind.; L. W. Gorton, of Chattanooga, Tenn.; M. A. Jett, of Valparaiso, Ind.; W. A. Johnson, of Hamburg, Iowa; A. T. Kridler, of Alva; Hugh McCaslin, of Snyder; R. M. Mendez, of Lares, Porto Rico; Y. C. Moore, of Sharon, Tenn.; H. S. Pope, of Baltimore, Md.; F. B. Raynale, of Sentinel; C. W. Reed, of Woodbine, Iowa; L. J. Roe, of Blue Jacket; E. R. Russell, of Atoka; A. L. Sittler, of Davenport, Neb.; S. S. Stewart, of Columbiana, Ohio; H. E. Tharp, of Denver, Colo.; E. F. Trolinger, of Nashville, Tenn.; W. H. Vawter, of La Fayette, Ind.; S. R. Washko, of Windber, Pa.; F. E. Wenham,

of Eldora, Iowa; G. E. White, of Bloomfield, Iowa; and H. V. Williamson, of Delta, Colo.

Through the reciprocal recognition of the licenses issued by the boards of other States, the following were registered without examination:

R. O. Carroll, of Claremore; F. H. Coulter, of Lehigh; F. J. Falter, of Dustin; M. T. Loeffler, of Mason, Texas; J. N. Mize, of Sapula; M. R. Odell, of Oklahoma City; and C. E. Vest, of Kansas City, Mo.

The next meeting of the board will be held at Oklahoma City, April 11th and 12th.

Oregon Board.

Sixty-two applicants for registration were examined at a meeting of the Oregon Board of Pharmacy, held at Oregon City, December 13th and 14th. Of this number the following thirty-eight were successful:

As pharmacists—F. S. Amick, of Ashland; Leonard Benninghoff, of Kenton; F. R. Bowersox, of Monmouth; G. E. Bradshaw, of Arleta; C. C. Bruch, of Portland; Almeron Crandall, of Brownsville; T. E. Crank, G. E. Eades, W. H. Fearnely and E. L. Frick, all of Portland; A. A. Gassard, of Nogales, Ariz.; H. E. Goodner, of Portland; G. C. Griffith, of Seattle, Wash.; H. C. Henderson, of Portland; Reinert Hetlesater, of Lents; W. L. Karr, of North Bend; J. P. Lowthean, J. A. McCall and V. E. McElwain, all of Portland; H. C. Mack, of Drain; G. R. Olin, G. V. Payns and A. W. Porter, all of Portland; Fred Powell, of Gresham; W. H. Prunk, of Salem; J. E. Rawlings, K. P. Scott, P. R. Shea, Moses Steinberg, R. W. Stevens, E. W. Suckow, and J. P. White, all of Portland; and H. L. Wilton, of Spokane, Wash.

As assistants—W. R. Bunn, F. M. Craig, and Wilfred Norby, all of Portland; A. W. Schlader, of Silverton; and F. J. Streibig, Jr., of Portland.

The next meeting of the board will be held at Salem, March 14th and 15th.

Rhode Island Board.

Only one applicant was examined at the meeting of the Rhode Island Board of Pharmacy, held February 7th, at Providence. He was H. I. Hough, Jr., of Providence, and he passed the examination.

The next meeting of the board will be held at Providence, March 7th.

Tennessee Board.

As a result of examinations conducted by the Tennessee Board of Pharmacy, January 17th to 20th, at Nashville, seven candidates received certificates of registration as follows:

I. H. Bilrey, of Nashville; E. A. McAdoo, of Troy; J. D. Martin, P. T. Rogers, and T. M. Smith, Jr., all of Nashville; C. D. Tedder, of Rockwood; and E. H. Webb, of Nashville.

At this meeting it was decided to adopt additional educational qualifications for examinations and after the July meeting candidates will be required to file with their applications for examination evidence that they have the equivalent of a grammar school education.

The next meeting of the board will be held at Memphis, April 18th.

Utah Board.

At a meeting of the Utah Board of Pharmacy, held at Salt Lake City, January 17th to 18th, seven applicants for registration were examined, of whom two were successful. These are:

B. K. Bridge, of Salt Lake City; and T. G. Lienhardt, of Ogden.

The next meeting of the board will be held at Salt Lake City, April 18th and 19th.

Wisconsin Board.

At a meeting of the Wisconsin Board of Pharmacy, held January 10th and 11th, at Madison, the following applicants for registration were successful:

As pharmacists—R. H. Barth, of Milwaukee; W. G. Cotanche, of Oshkosh; A. W. Deicken, of La Crosse; C. A. Erickson, of Soldiers Grove; E. N. Farber, of Milwaukee; James Hanson, of Sturgeon Bay; G. C. Jeske, L. F. Kozlowski, Frederico La Piana, and F. J. Pawlak, all of Milwaukee; F. A. Quilling, of Menomonie; C. C. Robertshaw, of Elkhart Lake; F. M. Scheele, of Wauwatosa; E. F.

Schmutzler, of Milwaukee; Max Tetzlaff, of Watertown; and William Weimar, of Dale.

As assistants—E. B. Arnold, of Lake Geneva; A. B. Averbook, of Superior; E. G. Bach, of Green Bay; W. J. Brennan, of Woodstock; Clarence Davidson, of Milwaukee; W. S. Hammersley, of Lake Geneva; R. D. Johnson, of Stanley; Arthur Merke, of Milwaukee; F. G. Pomeroy, of Kenosha; and B. P. Roska, of Port Washington.

Through the reciprocal recognition of the licenses issued by the boards of other States the following were registered without examination: W. B. Ackerman, of Fond du Lac; H. P. Harris and H. B. Hoeveler, both of Milwaukee; E. E. Leeson, of Sharon; and R. J. Morley, of Manawa.

The next meeting of the board will be held April 11th and 12th, at Madison.

About the Traveling Man.

The Druggist and Traveler.*

By J. P. GILMOUR.

The commercial traveler is greater than the ambassador, to whom he has been rhetorically compared, for he is often the courier of civilization, the propagator of progress and the pacificator of nations. Yet we often receive him coldly or cavalierly, treat him with scant courtesy and dismiss him as though he were a mendicant. It is a common complaint against the traveler that he wastes the shopkeeper's time, whereas, unless the latter is a mindless, shiftless creature, his time is saved, not lost, by the traveler's call.

The traveler should always be received hospitably. If you have nothing for him, infuse a little kindly warmth into your manner of giving him his turn-down. Should you have an order for him let him have it without needless palaver, for his time is as valuable as yours. It is bad morals, as well as bad business, to buy what is not required, or to buy too speculatively, simply because the buyer has not the courage and wisdom to say "no" and mean it.

The traveler is a good servant but a bad master, keep him, politely but firmly, in his place, and keep your own.

About Drug Drummers.

In examining the question of traveling salesmen a committee of the National Wholesale Druggists' Association brought to light some interesting facts. The committee mailed inquiries to 220 wholesale drug houses and received answers to about half of them. Using these answers as a basis it was able to give some details.

Eighty-three houses employed drummers on straight salary; 19 employed on commission, and 49 employed on salary and a commission on sales over a certain amount.

The smallest cost of a drummer was \$160 a month; the largest, \$485.34; and the average, \$251.88.

To the question, "How often do your salesmen visit their customers, 102 houses replied. Of these, 29 said from one to two weeks; 26 from two to four weeks; 15 from two to three weeks; 15 from one to four weeks; 2 from three to five weeks; 5 weekly; 4 every thirty to sixty days; 3 monthly; 3 weekly to four times a year.

Be Good to the Traveling Salesman.

The drummer is full of information, full of good nature, and always a gentleman, writes W. E. Sweeney, in the *American Grocer*. He is ready to give you points and his points are worth listening to. When I first became a buyer I was instructed to be courteous to the traveling man. The buyer that isn't misses many a plum. Your position may not be that of buyer, but you can show this man politeness in many ways. Besides you can learn a lot from him.

The life of a traveling man is not all honey drip syrup, but did you ever meet a successful one who was not opinionated—and very much so? So asks Milton Hartman in the *Pill Box*, and he then goes on to say that traveling puts a bob-tail on a man's kite, and disillusionizes him. A couple of years on the road are worth half a dozen in a college.

Seward W. Williams, for many years with Seabury & Johnson, of this city, is now with Bauer & Black, of Chicago.

"Did that medicine ever help anyone?" "Yes; the drug-gist. It's \$3 a bottle."—New York *Evening World*.

Obituaries.

LEO ELIEL.

One by one the leading men of the older generation of pharmacists are going over to join the great majority. Leo Eliel, of South Bend, Ind., died February 10th of apoplexy, being at his store and seemingly in good health when the fatal attack came on. He was sixty-six years old, having been born at Nentershausen, Hesse-Cassel, Prussia, in 1845. His father, who was a physician, came to America with his family when the son was a boy of eleven years, and settled at La Porte, Ind., where a brother of the elder Eliel was in business.

In those days German physicians in that part of the country experienced difficulty in having their prescriptions filled according to their own ideas, so, there being a little drug shop for sale, Dr. Eliel purchased it, and therein his three sons grew up, as the subject of this sketch once expressed it, "like kittens." Two of the brothers continued in the retail drug business at La Porte until they went to Minneapolis and embarked in the wholesale

LEO ELIEL.

branch of the trade, and one of them, J. C. Eliel, became a national figure in wholesale circles. In 1873 the brother who has just died began business on his own account at South Bend, where he remained to the end. His first store there was in the suburbs, but later he moved to the business part of the town and took a partner. The partnership was dissolved in 1899 and Mr. Eliel then spent a few months in the laboratories of Purdue University in order to familiarize himself with the advancement made in the technic of his profession. He then, January 1st, 1900, opened a pharmacy which he strove to conduct according to strictly professional ethics. He experienced much difficulty in educating the people of his city to an appreciation of his attitude, but succeeded in putting his business on a profitable basis. It was hard work to make the people understand why he did not recommend nostrums for their ills, or keep a fancy-goods bazaar.

In 1901-03 Mr. Eliel reorganized the department of pharmacy of the University of Notre Dame, in his city, in which he taught; and later resigned the professorship in order to give his individual time to his private interests.

Mr. Eliel was elected president of the American Pharmaceutical Association in 1906, and presided at the meeting held in this city the following year. He joined that association in 1882 and did much good work in it for pharmacy, but in a very quiet and unobtrusive manner. In 1887 he was made a member of the committee on prize essays. The next year he was put on the committee on commercial interests, and became chairman of that section the following year. He was thrice elected a member of the council, his second term expiring as his installation as president took place, and his third term beginning as he laid down the insignia of that office. From 1894 to 1900, the year in which the pharmacopœial convention was held, he was chairman of the association's committee on the revision of the Pharmacopœia. In 1893 he was elected first vice-president.

As in the American Pharmaceutical Association, so in the State organization, Mr. Eliel was an active but not a noisy worker. He was elevated to the presidency of the Indiana Pharmaceutical Association in 1886.

Personally Mr. Eliel was a man of pleasing manner, kindly expression and soft voice. His sense of humor was well developed, and his wit, while keen, was never obtrusive nor used to hurt the feelings of others. He was a close student of pharmacy and an unusually well-posted one. As a citizen he was always ready to do his part for the general good, and his name always went down, as a matter of course, on the list of those who could be depended upon to take part in any worthy public movement of a commercial, educational or musical nature. Mr. Eliel was a bachelor and lived with a sister. It had been his expressed intention soon to take an extended vacation to be spent in travel. He was a Mason and a Knight of Pythias.

CALEB R. KEENEY.

On February 1st, there passed away at Philadelphia one of the few remaining apothecaries of the apprenticeship days. This was Caleb Reynolds Keeney, born at Carlisle, Pa., in 1825, and a member of the apothecary's craft since 1842. Mr. Keeney was graduated by the Philadelphia College of pharmacy in 1846; and in April of the following year opened the drug store which he continued until his death.

Mr. Keeney was a member of the Society of Friends. His wife died a few months ago just at the end of the fifty-fifth year of their married life. A son and two daughters survive.

The appended appreciation of Mr. Keeney is from the pen of his long-time friend, Evan T. Ellis.

In the death of Caleb R. Keeney the dispensing drug trade has lost one of the landmarks of the profession. Mr. Keeney was born in Carlisle, and received his early education there. Coming to Philadelphia he was apprenticed to Henry C. Blair, who had one of the leading pharmacies of the city, at Eighth and Walnut streets, where Henry C. Blair, III, is now.

Mr. Keeney, at the termination of his apprenticeship, commenced business at Arch and Sixteenth streets, continuing it to the day of his death. His son has been associated with him for thirty-five years, and succeeds to the business. When Mr. Keeney first commenced there was a corn-field with an old post-and-rail fence at the opposite corner. Now it is in the midst of a densely built-up and populous neighborhood.

There are not many pharmacists in Philadelphia to-day who have remained so close to their calling. He was as Prof. Parrish used to say, "an oracle" in his vicinity; he was supposed to know every body of any account in his section, and generally did. Even to-day if we wish to ascertain the residence of any one unknown to us we are sure to inquire at the nearest pharmacy. Mr. Keeney saw many changes in his vicinage: old families vanished; new people came in; other stores at times came near him, but nothing could impair the confidence reposed in him and his pharmacy by his neighbors and the medical profession. Living, myself, for a time nearby and frequently dropping in I do not recall a proprietary or many of those inconsistent articles that nowadays in some stores take up more space than legitimate drugs, although there might have been out of sight enough for legitimate needs.

Mr. Keeney was graduated at the Philadelphia College of Pharmacy in the class of 1846. In the same class was the late Thomas S. Wiegand, so long connected with the college. He was a member of the college and for many years of the American Pharmaceutical Association. Of quiet tastes and retiring nature he won the esteem of all who were brought in contact with him.

HENRY I. TAYLOR.

Henry Irving Taylor, of Detroit, Mich., died January 3d, aged fifty-one years. Mr. Taylor was for thirty years connected with Frederick Stearns & Co., serving during the greater portion of that time in the capacity of manager of the Canadian branch. He was born at Ridgeville, Ohio, and received his pharmaceutical education at the University of Michigan. He is survived by a widow, a daughter and four sons.

Following are recently reported deaths of other persons in the pharmaceutical world:

MAXWELL ABERNETHY, of Jersey City, N. J.; January 16th, aged seventy-six years.

HARRY APPEGATE, of Hamilton, Ohio, aged forty years.

THOMAS ARNOLD, of Wichita, Kansas; January 29th, aged thirty-eight years.

GEORGE NEWELL BARRETT, of Jamaica Plain, Mass.; January 31st, aged seventy-three years.

HAROLD B. BATEMAN, of Savannah, Ga.; January 18th, aged twenty-four years.

DR. DANIEL A. CASELLA, of this city, January 30th, aged forty-eight years.

JOSEPH CORRIGAN, of Jericho, R. I.; February 5th.

THOMAS CUNNINGHAM, of Newburgh, N. Y.; December 30th, aged eighty-two.

THEODORE G. DE MOLL, of Washington, D. C.; January 27th, aged fifty-seven years.

CARL E. H. EBENDECK, of Whitestone, L. I.; February 10th, aged thirty-five years.

FRED B. ELY, of Owego, N. Y.; January 28th.

WILLIAM FAIRFIELD, of Boston, Mass.; aged fifty-one years.

DR. THEODORE F. FIEMP, of St. Louis, Mo.; aged thirty-eight years.

E. H. GILSON, of Paducah, Ky.; aged forty-four years.

L. T. GWIN, of Cleveland, Miss.; January 28th.

J. M. HANNA, of Murphysboro, Ill., January 16th, aged sixty-five years.

ARTHUR MORGAN HOBBS, of Brooklyn, N. Y.; January 30th.

HEHRY W. HOEFEN, of Rochester, N. Y.; recently.

WILLIAM G. HOWARTH, of Chester, Pa.; January 23d.

E. B. KAIGH, formerly of San Antonio, Texas.

ALBERT D. KENNEDY, of this city, at Somerville, N. J.; recently.

WILLIAM H. LEICKHARDT, of Nashville, Tenn.; aged sixty-seven years.

JAMES C. LOWRANCE, of Little Rock, Ark.; January 14th, aged seventy years.

HARRY M. MCCLAREN, of Sewickley, Pa.; January 20th, aged forty-one years.

WILLIAM COWPER MCPIKE, of Kansas City, Mo.; February 3d, aged seventy-four years.

Dr. E. MARSH, of Alton, Mo.; January 13th, aged seventy-eight years.

THOMAS R. MORRIS, of Pittsburg, Pa.; January 20th, aged fifty-four years.

CHARLES RAPPE, of Albany, N. Y.; January 21st, aged thirty-three years.

CHARLES F. SAUTER, of Jamaica, N. Y.; January 18th, aged fifty years.

GEORGE H. SCHRACK, of Philadelphia, Pa.; February 1st, aged ninety-two years.

E. B. SEARS, of Denver, Colo.; January 26th, aged thirty years.

HENRY NATHANIEL SHROM, of Greenville, Pa.; February 10th, aged seventy-nine years.

Dr. JOSEPH F. SOMMERHOFF, of Bloomfield, N. J.; December 25th, aged forty-five years.

ALBERT HALSEY SWEET, of Milford, Mass.; January 15th, aged sixty-eight years.

JOHN M. THORNTON, of Des Moines, Iowa; January 14th, aged ninety-two years.

RICHARD H. VENABLE, of Louisville, Ky.; January 25th, aged sixty-nine years.

WALTER CHARLES VON DER ESPT, of Louisville, Ky.; January 14th, aged forty-eight years.

ROBERT ELTON WILLIAMS, of Hampton, West Va.; January 22d, aged thirty-five years.

JOHN H. WOOD, of Miami, Fla.; January 15th, aged sixty-eight years.

Horace Franklin Whitman, president of the firm of Stephen F. Whitman & Son, Inc., manufacturing confectioners, of Philadelphia, Pa., died January 9th after an illness of many months. He was born at Philadelphia in 1848, and was graduated from Yale with the class of '69. Mr. Whitman was a member of many organizations and a prominent Mason. He is survived by a widow and one daughter.

Harlow E. Woodward, of Boston, Mass.; aged sixty years, is dead. Mr. Woodward was reputed to be the original "cutter" of prices on medicines. He was an authority on early New England and American history. He had a fondness for literature, and at one time owned *Old Curiosity Shop*, a magazine from which was developed the *Ladies' Home Journal*.

J. C. Turner, a traveling salesman for the firm of Schieffelin & Co., of this city, died at his home near Columbus, Ga.; December 25th. Mr. Turner was well known in the States of Florida, Georgia and Alabama, and practically died in harness, being stricken with paralysis at Girard, Ala., while talking to a customer.

Hawthorne Hill, for ten years associate editor of *The India Rubber World*, died in this city, February 2d. He was born at Marion, Ky.; and was fifty-three years of age. Mr. Hill was formerly connected with the metropolitan daily press.

George Arthur Plimpton, a member of the firm of Plimpton, Cowan & Co., wholesale druggists of Buffalo, N. Y.; died January 13th, after a month's illness. He is survived by a widow and two sons.

Ernest George Riefflin, only son of George T. Riefflin, of this city, died on January 21st, at Litchfield, Conn.; aged twenty-one years.

Mrs. Kate Faber, wife of Sidney Faber, of this city, former secretary of the eastern branch of the old New York Board of Pharmacy, died recently at South Orange, N. J.

National Association of Pharmacologists.

At the January meeting of the National Association of Pharmacologists held at Columbus, Ohio, it was decided to hold the first annual meeting of the organization at Columbus, June 29th.

Owing to the tender age of the association and the fact that the various committees are still incomplete, only one day will be devoted to the transaction of business.

At the monthly meeting committees were elected for five States; a plan of organization was adopted and made a part of the constitution; the reports of the national and State legislative committees were received and commended; and the constitution was amended so that the association might further extend its work along scientific and organization lines.

Anti-Narcotic Activity at St. Louis.

If any reliance was to be placed in the statements that from time to time appeared in the daily press of St. Louis, Mo., that city was, not so long since, a very hotbed of drug habitués and illicit venders of narcotics. Similar testimony was brought out during the recent hearings on the Foster bill. But things are no longer as they were reputed.

The Missouri Board of Pharmacy with the energetic assistance of the municipal police have practically eradicated the illicit sellers; two "druggists" have been heavily fined; another has had his pharmacy license revoked. The pharmacists of the city are hopeful for the permanency of the results of the crusade.

Albert B. Baltzly celebrated his tenth anniversary as proprietor of the store at the northeast corner of Broadway and Ninety-sixth street, February 17th and 18th. Although within a few blocks of him there is a big link of a chain of stores, and three such links within a dozen blocks, to say nothing of innumerable small drug stores, Mr. Baltzly, by pushing his business along progressive lines, has made a marked success of it.

Newspaper reports have it that "Hegeman & Co." [Riker-Hegeman Company (?)] of this city, are negotiating for a location for a branch store at Bridgeport, Conn.

The Druggists Circular

Entered at the New York Post Office as second-class matter.

ESTABLISHED 1857.

Published monthly at
100 William street, New York, by
THE DRUGGISTS CIRCULAR,
William O. Allison, President and Treasurer.
D. G. Bogert, Secretary.

Address all communications to The Druggists Circular.

Subscription Rates.

For the United States and Mexico, TWO DOLLARS PER YEAR; if paid in advance, ONE DOLLAR AND FIFTY CENTS. Foreign and Canadian subscriptions, \$2 a year, payable in advance. Remittances should be made by Check, Express Order on New York, Post Office Order or Draft on New York, payable to The Druggists Circular.

Net Advertising Rates.

Special prices are charged for preferred positions. Changes for standing advertisements should reach us before the TWELFTH of the month, as we commence printing on that date. New advertisements sent in before the 23rd of any month can be inserted in the following issue.

No order given to any representative of this paper becomes binding until approved by the publisher or manager.

Questionable or undesirable advertisements will not be accepted.

Classified Opportunities.

Advertisements are inserted under this heading without display except as to a portion of the first line; the charge is at the rate of 25 cents for six words, each figure, abbreviation or initial being considered one word. Terms: invariably cash with order.

THE DRUGGISTS CIRCULAR

A Practical Journal of Pharmacy and General Business Organ for Druggists

VOL. LV. NUMBER 4.

NEW YORK, APRIL, 1911.

WHOLE NUMBER, 652.

Druggists and Anti-Narcotic Legislation.

Pharmacists throughout the country have long recognized the evils growing out of the indiscriminate sale and use of habit-forming narcotics, among which opium and its principal alkaloid, morphine, and cocaine are the most widely used. Recognizing this evil, and realizing that many in their ranks are partly (although not mainly) responsible for its growth, pharmacists through their organizations have done much to secure the passage of laws to curb it. They have drafted model anti-narcotic bills and have made representations to legislators which have resulted in the passage of such bills. Be it said to the eternal credit of the drug business—wholesale and retail—that while many men engaged in it have through weakness, cupidity, carelessness, or some other cause, yielded to the demands of their customers for larger supplies of habit-forming narcotics than should be sold, the organized associations of druggists have uniformly stood for the right in this matter. Instance after instance could be cited, but perhaps even better than pointing out individual cases is to say that as a result of pharmaceutical association work there are on the statute books of most of the States, laws so circumscribing the sale of these drugs and fixing such heavy penalties for violation, that the illegitimate traffic in them has been almost driven from the drug stores of these States, and is now largely confined to peddlers and denizens of the lower world. Furthermore, the American Pharmaceutical Association has repeatedly gone on record as favoring stringent anti-narcotic laws, and has not stopped there but has been active in its efforts to accomplish something tangible along this line. The same is true of the National Wholesale Druggists' Association. As to the National Association of Retail Druggists, perhaps no word of ours can so succinctly set forth its attitude toward this question as do a preamble and some resolutions adopted by it last year at Pittsburg. These follow:

Whereas pharmacists are unalterably opposed to the sale, distribution, and use of habit-forming drugs to an extent that injury to many unsuspecting persons may result; and

Whereas pharmacists have aided in the enacting and have earnestly supported laws tending to prevent drug habituation; and

Whereas existing laws do not prevent the public from obtaining habit-forming drugs in such condition and quantity as to cause them to become drug slaves; be it

Resolved, That this association favors legislation that will safeguard the public by preventing any person, even a licensed physician, from dispensing, distributing, or

selling habit-forming drugs, except under proper restrictions.

Any feasible bill intended to stop the illegitimate sale of habit-forming drugs is entitled to and will receive the support of organized pharmacists in the territory to be covered by the proposed law; and when organized pharmacists find it necessary to oppose the passage of any anti-narcotic measure it is because they do not regard it as properly adapted to the accomplishment of the end at which it is aimed.

Testing the Food and Drugs Act.

In a case pending in the federal court for this district, some mention of the details of which appears in our news columns this month, the constitutionality of the food and drugs act has been attacked, and it was thought at one time that the points raised by the attorneys making the assault would be carried to the supreme court for adjudication. It seems now, however, that the ruling of the circuit judge on the demurrer in which the points were presented, sustaining the law, are so conclusive as to render any further attempt along similar lines to overthrow the act a hopeless undertaking, and it is understood that no appeal will be taken from this ruling.

In the demurrer two contentions were made that are of general interest, one of which is particularly interesting to druggists. The first was that the food and drugs act is unconstitutional in that it is an ex post facto law. This contention was based upon the fact that the law says that the standard of a drug shall be determined by tests laid down in the Pharmacopœia "official at the time of investigation." It was argued that a drug might be up to the standard fixed by the Pharmacopœia official at the time of the sale of the drug, but below the standard of a revised Pharmacopœia which might have become official prior to the time of investigation. The court held that if the statute were to be construed to mean what the attorney argued it meant, it would clearly be unconstitutional, but the court took a broader view of its meaning and intent, saying that the crime of shipping adulterated drugs if committed at all is committed at the time of the shipping, and that by "investigation" is not meant simply the chemist's examination of the drug, but rather the general inquiry into the circumstances in which the drug was shipped, which inquiry must of necessity cover the time the shipment was made and be into conditions which existed at that time. The federal law does not and can not make

adulterating a misdemeanor; that is a matter for the State government to look after. What it does prohibit is the *shipping* in interstate commerce of adulterated drugs, and if a shipper of drugs is not guilty when the shipment takes place and by reason of the shipment, he is not guilty at all.

Having disposed of that point, this court took up the second one, which is of peculiar interest to pharmacists, as it concerns the status of the Pharmacopœia as a legal standard, that is to say, any Pharmacopœia which has come into existence since the passage of the food and drugs act, or which may come into existence in the future. It was argued by the defendants in the case under discussion that congress had exceeded its constitutional authority when it had delegated to outside bodies, especially as those bodies are no part of the government machinery, the responsibility of saying what should and what should not constitute a crime. As a matter of fact it does not seem to us that congress has undertaken to delegate any such responsibility; congress itself defined the crime, and only left it to some body more conversant with drugs and their use to say what the recognized standards for them under the law should be, and to lower, raise, abandon or add to these standards as the advances in pharmacy, botany, chemistry and medicine might render desirable. The court took this view of the facts, and as to the law applicable to them, cited a legal precedent which had been established in the case of the Union Bridge Company against the United States. In this case it was claimed that the bridge company was guilty of "unreasonable obstruction to free navigation" of the Monongahela and Alleghany Rivers, contrary to an act of congress. The court held that what might not have been obstruction to navigation in 1874 might be such an obstruction in 1902, and that this was a matter for determination by the secretary of war, with the assistance of his engineers. In deciding the bridge case the court had cited with approval another case, known as Locke's appeal, in which a principle of law had been laid down as follows:

The legislature cannot delegate its power to make a law, but it can make a law to delegate a power to determine some facts or state of things upon which the law makes or intends to make its own action depend. To deny this would be to stop the wheels of government. There are many things upon which wise and useful legislation must depend, which cannot be known to the law-making power, and must therefore be a subject of inquiry and determination outside of the halls of legislation.

"The Ohio case," reported and commented upon in the CIRCULAR for January, 1897, page 1, did not seem to impress the court as having disposed of an analogous point. In that case it was held by the supreme court of the State of Ohio that as the Pharmacopœia of 1880 was the one official when the drugs act under which the action was brought was passed, the trial court had erred in admitting as evidence a copy of the Pharmacopœia of 1890. Since then the Ohio legislature has changed this law by specifying therein that the seventh decennial revision of the Pharmacopœia was to be regarded as the legal stand-

ard, and subsequently it has changed the word "seventh" to "eighth," and presumably will in two or three years, strike out the word "eighth" and insert in lieu thereof the word "ninth." The legislature of Ohio did not provide for the acceptance by the courts of any future revision of the Pharmacopœia, but congress has made this very provision; and in doing this, the court in the case now pending says that it has acted within its rights.

While the point has not been raised in the case under discussion, it is believed in some quarters that when the seller of goods alleged to be adulterated is not present when samples of such goods are taken for examination, and has no means of knowing whether the sample examined is really a true sample of the goods sold by him, it is unjust and illegal to hold him to account for any shortcoming in the sample or in the broken package of the goods. It is pointed out that it would be an easy matter for some one either in or out of the employ of the government, actuated by malice, spite or other base motive, to adulterate the goods after they had left the control of the shipper, or to use a false sample in making tests. The constitution forbids that any man should be deprived of his property or liberty without due process of law, and it may be that in time the courts will be asked to say whether or not the system at present in vogue under the federal law of collecting samples and condemning shipments of drugs does not come within the meaning of that prohibition. No one charges that any spite or malice has been shown, or any fraud practiced by the government officials, but it is easy to see that an abuse might easily creep in just here unless the rights of citizens are properly safeguarded.

As our readers all know, or should know by this time, we are heartily in favor of the food and drugs act. We believe that it has accomplished more good for the public than has almost any other law passed within the memory of the present generation, and that the good it has done is but a suggestion of what it bids fair to do in time. For such a law to be wiped off the statute books would be a great calamity, and one which the public will never allow to befall if it can prevent it. If the law is weak, and, in one way, it admittedly is, in that it falls short of reaching many abuses, it should be strengthened. We look for congress to make it better and broader. We want to see it as good as such a law can be made, and we want to see it applied to more things. We despise dishonesty and wish that it were possible to legislate it off the face of the earth, but recognizing the futility of undertaking to do this, we are glad to see any law which will make dishonesty in any certain direction so unprofitable that it will be practiced but little if at all. In this position we are with the better element in the trade. All recognize the fact that it would be to the advantage of everyone concerned if drugs were true to label. The way to improve the law is to locate its weak spots through judicial procedure, and then have such spots replaced by lawyer-proof sections. The act is comparatively new and has not stood the test of vigorous assault made on it in the highest courts.

Maybe when this test is applied the act will come out stronger than ever, maybe it will fall. The present attack does not seem to have weakened it in the least.

For Less Expensive Association Meetings.

So much has been said and written about the advantages to druggists of attending association meetings, that it seems almost like carrying coal to Newcastle to lay before them anything more on the subject. The good which pharmaceutical associations do in securing needed laws and in retarding inimical legislation, the benefits which accrue to business men who get out and rub elbows and exchange ideas with their fellows, the new life which comes to those who leave their stores for a while and take a little trip in which business and pleasure are intimately combined, the duty which a man owes to his calling—all these and many other matters which should be considered by druggists in connection with their local, State and national associations have been dwelt upon so frequently and at such length that it seems almost a waste of effort to try to emphasize them here. And there is another point having a very direct bearing upon the size of the attendance at the State and national meetings, which, while it has been touched upon now and then, may perhaps be brought out again with profit to some of the associations, and approval from some of those who compose their membership. We refer to the cost of accommodations at the hotels selected as the meeting's headquarters.

While the style of "The Stroller," whose random shots our readers have seen from time to time, is rather quaint and inclined toward the humorous, that writer has hit more than one bull's eye as effectually as if he were as prosy as the staidest of editors. A dozen years ago, in writing on the subject now under discussion, that free-lance gave utterance to some words which are as true now as they were then. He said:

Being the kind of a man that has to look twice at a nickel before boarding a street car and then walking—it seems to me that the expense attached to going to some of our State pharmaceutical association meetings is prohibitory to the rank and file of the profession. When it comes to paying \$3.50, \$4, or \$5 a day at a hotel, or twice that if you take your wife, on top of railroad fare, the hiring of a "relief" for a week, paying for "entertainment," and the loss of trade that may result from the proprietor's absence, it is no wonder that the men who make their money by rolling 24 pills for 25 cents hesitate—and then stay at home. A few druggists are wealthy; quite a good number are well-to-do, but many of them, and just as good druggists as anybody, cannot take \$50 out of the safe without shaking the very financial basis of their business.

Messrs. Committeemen on time and place, and you Mr. Chairman of the committee on arrangements, give the poorer brother a chance occasionally by holding the meetings at an inexpensive place, transacting the business promptly, omitting entertainment assessments, which, although voluntary, cannot be avoided by a man who prides himself upon always holding up his end, and announcing in advance that such will be the program. My word for it, new faces will be seen at that meeting, and the advancement of the profession will not be in the least retarded.

In his presidential address before the American Pharmaceutical Association at Richmond last year,

Dr. H. H. Rusby emphasized the same point. He said:

Conditions of time and expense must ever be expected to prevent a large majority from being present.

In just so far as we can remove these adverse conditions we can increase our attendance, so that even the humble questions of transportation and hotel rates become well worthy of a place in the presidential address. I believe that on various occasions a more insistent course on the part of the committee of arrangements might have succeeded in securing better rates from the hotels that we have patronized. In other cases, accommodations equally good in their essential features might have been secured by the selection of less expensive headquarters. It is always possible for those who so desire to stay at a more expensive hotel than that selected for the headquarters, but it is not so easy or agreeable to leave the headquarters hotel for one that is less expensive.

It is especially desirable that there should be an increased attendance by the members of our families, and several possibilities for bringing this about suggest themselves. Perhaps the most important is that the headquarters hotel should be induced to make a really liberal concession to additional members of a family, occupying the same room. It does not admit of dispute that the additional expense of the occupation of a room by an additional person is quite trifling, and that a good hotel management should be ready to make concessions for securing an additional guest in this way, a concession which is of considerable importance to our members and to our meetings. It has, however, become a very common policy for hotel clerks to refuse such terms, unless insisted upon. It would be well for future committees of arrangements to make a special feature of securing such rates and to insist upon them as one of the conditions of the contract. Such an arrangement would certainly tend to increase the attendance of our families, especially of those living near the meeting place, with great consequent advantages to the social features of our meetings.

There is much in the meetings of the State and national pharmaceutical associations which make them well worth any druggist's while to attend, and anyone who makes it easier for a large number of druggists to be present at these meetings is a real benefactor of those druggists and of pharmacy.

PSYCHOLOGICAL HELP WANTED: Here is a druggist who is puzzled by a phenomenon he has many times observed in his routine work. He states the case somewhat in this way: On days when cash sales run above normal, when many accounts are paid, when the clerks are rushed with work, and the cash-register record mounts away up among the large figures, the cash and the record tally; but on days when there is nothin' doin'—or almost nothing—when there are few people on the street and most of them pass by the store without stopping, when the clerks have plenty of time to devote to all the details of their routine duties, the cash will not balance. As with the cash register so with the want book, and so with the day book—the busier the day the fewer the entries that should be made on these books are omitted. Our querist wants to know why this is thus, and not being able to arrive at a satisfactory answer has referred the matter to our psychological department. As this department is a little weak just now, its manager being on a vacation, we are passing the question up, or, rather, along. Many druggists are mind readers—they have to be—and among them there may be some who have advanced far enough in the occult science to be able to throw a little light on this rather esoteric problem.

NOMINATIONS FOR OFFICE IN THE AMERICAN PHARMACEUTICAL ASSOCIATION are not made under ideal conditions. While it is all right for the nominating committee to be large and representative and democratic, it is a fact that a committee so composed is apt to be clumsy and to act without due consideration of the reasons which should guide it in the important work it is called upon to perform. Moved by the enthusiasm of the moment this committee has been known to nominate for high office in the association an individual who was not a member or even a pharmacist, but had been active on the local entertainment committee. Fortunately, the nomination was recalled before it reached the general session, and so caused no embarrassment to the association, the committee, or the nominee. As five members of the nominating committee are appointed by the president—usually from among the “elder statesmen” of the association—it might be well for these members to be apprised in advance of their prospective appointment, in order that they might have time to consult and come into the committee meeting with some well defined ideas as to who’s who and why. If their conclusions were sound they would be adopted by the committee.

YOU ARE TAKING BREAD FROM OUR CHILDREN was the cry of certain druggists when a campaign was launched against the fake beauty-column advertisements of various preparations which while more or less useless, still helped to stimulate business. Later, as these preparations grew in number, thanks largely to the attitude of these druggists toward them, the druggist themselves cried out for relief, saying that they would be undone if they had to stock many more of the fakes. Which goes to show that a fight for the right sometimes quickly turns out to be better even for the time-servers and money-grubbers than an acquiescence in a wrong for the sake of what may seem to the short-sighted to be expediency.

Fighting Flies.

But for his unparalleled persistence the fly would have been so discouraged and saddened by the remarks that have been made to him, at him and about him that he long since would have resigned, assigned, quit, gone out of business, shut up shop. The most hardened grafter in politics could not stand the abuse which he receives if it were not for those who flatter him, do him homage, and—get a “divvy” on his “rake off” now and then. Even the peskiest pedler would quit if he did not make a sale now and then. But who ever offered any aid or solace to a fly? It has been decided that he is not even a scavenger, and that is the only excuse for existence he ever offered. Truly the hand of every man, woman and child is raised against him; he is never free from attack; the scientist who heaps long names upon him and longer ones upon the results of his work, and the small boy that divests him of his principal means of locomotion are alike his enemies. He is an outlaw, made so by the edict of boards of health and the common consent of housekeepers and soda fountain attendants, bald headed men and the fellow whose business it is to keep the windows clean. In the language of a *Farm Journal* rimester, “Good-by, house fly; health boards cry you must die. You carry germs upon your feet, and drop them in the things we eat; deposit microbes

on our plates, and scatter them on shiny pates. Hurtful atoms you dispose upon Wopsy Popsy’s nose. Good-by, house fly; there’re reasons why you must die.”

One of these reasons is that physicians, microscopists, bacteriologists, entomologists, and other learned men, accuse the fly of transmitting tuberculosis, leprosy, cholera, summer diarrhoea of children, plague, carbuncle, yaws, oxyuris, tænia solium, swine plague, and typhoid fever. Regarding this count of the indictment, Secretary Pritchard, of the Chicago board of health, has said:

Fly time is here and our homes are to be invaded by the most dangerous insect known to man.

“My gracious!” I hear the good housewife exclaim. “Is it as bad as that? I always did hate the pesky things, but I had no idea they were really dangerous.”

Yes, madam, they are so dangerous as carriers of disease that you should fight for their exclusion from your home as you would against wild beasts seeking your life.

Flies are the dirtiest and filthiest of all vermin. They are born in filth. The manure pile, the garbage can and the out-door vault produce 99 per cent. of all the house flies in existence. They carry millions of disease germs on their feet. Study their habits just a little bit and you will be convinced. The fact is, the fly is so unspeakably nasty that it is impossible to tell you all the nasty things he does. He thinks nothing of leaving his feast of the carcass of a horse or dog to sample all the good things you have on your dining room table. He will crawl all over the butter or obligingly tumble into the baby’s milk with his germ-laden feet; or, escaping this fate, he meets his end in your tea or coffee. Rest assured that if you permit flies to have the freedom of your home you will actually eat the filth which they deposit on whatever they touch.

Now, for protection from this dangerous little pest, see to it that all doors and windows are carefully screened. Also be very careful to keep flies away from all foodstuffs.

Keep the premises clean. Do not allow decaying material of any sort to accumulate. Keep garbage cans tightly covered. Garbage can be sprayed with kerosene, which will prevent flies from breeding.

Some of the wise ones have discovered that the fly, like the old toper, wants a drink the first thing when he gets up in the morning. Let him have his drink, by all means, but not out of the baby’s milk bottle. Fix up something especially for Mr. Fly, and be sure that it is “fixed” good and plenty so that he will not want a second drink of it. Quassia fly paper is the thing, and it is not poisonous to man. When he goes out for his morning stroll, let Mr. Fly find some inviting walk prepared for him—a nice sticky one that will suit him so well that he will use no other after having once tried it. Incidentally, this kind of a walkway holds the germs which the dirty fly brings to it.

Formulas galore for fly powders, poison fly paper, sticky fly paper and other means of combatting the fly nuisance may be found in the volumes of the CIRCULAR for the past few years, a particularly choice collection appearing in the issue for May, 1909, page 223. Druggists could benefit humanity and earn a profit, by pushing anti-fly goods, and now is the season to begin this campaign. When everyone has done his duty in the matter of educating the public about flies, and done all he can to diminish the number of these unmitigated nuisances, the little verse below, from the *Saturday Evening Post*, will not seem as humorous as it was doubtless meant to be:

Hush-a-by, Baby, be still as a mouse,
I’m sure as can be there’s a fly in the house;
I pray thee don’t stir, dear; abide here in peace,
And I will go quickly and call the police.

Real Bay Rum.

BY FREDERICK T. GORDON.

Recent comments on and formulas for bay rum in THE DRUGGISTS CIRCULAR have interested me considerably, as I have been more or less "shipmates" with bay rum this twenty years back. It is also interesting to one who is becoming a "back number" to read the same answers to queries which he as a youngster clipped out for future use and information. My personal experience with bay rum, as well as observation of its use and manufacture in its native land, and conversations I have had with those who know it long and intimately, leads me to offer a contribution on the subject.

Of course, as we all know, bay rum and its name are of West Indian origin. The article was manufactured and used in the West Indies by the affluent planters long before it was known in this country except by travelers. Perhaps its true origin is unknown, but I have been told by West Indian friends that the first bay rum was made by macerating the leaves of the bay tree (*myrcia*) in the native rum distilled from the molasses left as a residue in sugar-making, and that it was regarded by the natives as a stimulating and soothing (?) lotion very much as we of the North regard a distillate made from witch-hazel. Rum, in the years gone by, was a staple by-product of the sugar plantations, when it was made in crude stills from the fermentable molasses, or even from the refuse left after the cane juice had been boiled down to sugar and the brown product drained of its non-crystallizable residue.

When bay rum became better known as a toilet article and when more scientific methods of preparation were employed, it was made by distillation. Fresh leaves of the bay tree were bruised and put into a still and the still filled with crude rum. This was allowed to macerate over night, and then heat was applied and a liquid containing practically 50 per cent. of alcohol and the essential oil of the bay leaves came over and was collected. This product was the original bay rum, as we know it. It was, of course, a solution of the essential oil of bay in alcohol, but it had in addition odoriferous substances obtained from the raw rum used, and in my opinion the absence of these odoriferous substances from the official bay rum was the cause of the difference between the real article and the bay rum commonly sold.

The old-fashioned method of making this article has almost become obsolete; even in the island of Saint Thomas, which was once the headquarters of the bay-rum industry, little is now made by distillation. A large amount of bay oil is still made in various islands of the West Indian group, but most of it is exported for the making of bay rum in this country and Europe. I remember seeing one of the old-fashioned bay-rum stills in Saint Thomas in 1897, and was then told that it was much more profitable to distil bay oil and make bay rum from the oil by dissolving it in the cheap alcohol obtained from the distillates of the sugar cane plantations than it was to make bay rum by distillation. Then, the best bay rum could be purchased in almost any of the islands at a shilling a quart bottle, there being no local excise tax on the alcohol content. Even at that time most of the so-called "imported" bay rum was made by dissolving bay oil in spirit distilled from rum.

The bay tree, from which the leaves used for the

making of bay oil and bay rum are obtained, is common throughout the West Indian islands, and is also a native of our own Gulf States, but so large has the demand for bay oil and bay rum become that the oils obtained from allied species of trees are an almost universal adulterant of oil of bay. It is a common practice of the West Indian gatherers of bay leaves to include in their basket loads leaves of similar character and spicy odor, those gathered from various species of pimenta being the commonest adulterant. In appearance the freshly collected leaves of the other species are similar to the bay leaf, but the fresh, aromatic odor of the true bay leaf cannot be so imitated as to deceive one who knows this odor and can judge it.

Now as to what we call bay rum itself. Of course there are numbers of recipes for it, each producing a variety pleasant to some particular taste. The variations range from the 5-cent-shave-barber-shop kind to the real bay rum with its fresh fragrance and bouquet. As every druggist knows, bay rum can be made at almost any price the customer wants to pay, but few want to pay the price of real imported bay rum that has been distilled from fresh bay leaves in the old-fashioned way, so the real "nut of the kernel" of this contribution is to recommend a formula for making bay rum that was given to the writer by an actual manufacturer of this article in the West Indies. When one considers that the average retail price of imported bay rum is about a dollar a quart bottle, and that the *same* quality may be made here at a cost much less, it might be worth while to try this recipe.

To go back a bit: most people seem to think that bay rum should be yellow. The real bay rum is not. Real bay rum made by distilling crude rum with bay leaves has a pale straw color, sometimes a very pale greenish-straw color, as nearly as I can describe it; and when first distilled bay rum is practically white. The color given to the original article was obtained by macerating a few fresh bay leaves with the distillate, but to make the product look "stronger" some distillers added curcuma and thus gave their brand a deeper color. Psychologists have taught us that the deeper the shade a remedy possesses the "stronger" it seems to the man who judges medicine by its color. If one wants his bay rum yellow let him filter it through magnesium carbonate; if he wants it pale, he should filter through magnesium carbonate and neutralize the filtrate with a few drops of hydrochloric acid. The cost of the product can be made according to the amount of alcohol used, as the cost of the oils used is comparatively small as compared with the alcohol.

So here is the working formula, to which I come at last:

Oil of bay.....	5 c.c. (mils).
Oil of pimenta.....	1 c.c. (mil).
Oil of orange.....	1 c.c. (mil).
Alcohol	400 c.c. (mils).
Water	400 c.c. (mils).
West India (Santa Cruz) rum.	200 c.c. (mils).

Dissolve the oils in the alcohol, add the rum, then the water, and, after a few hours, filter. No coloring is needed.

If a "stronger" article is wanted, the amount of oil of bay may be increased to 6 c.c. (mils); and if the price of Santa Cruz rum is too high, one-half the amount directed may be replaced by diluted alcohol.

How Not to Buy a Drug Store.

BY A FRIEND OF THE MAN WHO DID NOT KNOW.

Once upon a time there appeared in a New York paper an advertisement in which was offered what was stated to be a fine opportunity for a hustling young man to buy a drug store for a nominal sum. The store was described as being in a town not a hundred miles from the metropolis. Those interested were notified in the advertisement to apply in person or by letter to a certain agent. An old school friend of mine, whose first name is George and last one might be Goodthing, but is not, looked up the agent with a view to buying the store, for he had received a fairly good education in pharmacy, and had been a drug clerk for some years. He had never undertaken to manage a drug store, but felt sure that he could give points to a lot of proprietors. George had saved some money while working for others, which fact made it easy for him and his friends to believe he had the makings of a good business man.

George had no trouble in locating the agent mentioned in the alluring advertisement of the "drug store offered for sale at a sacrifice because of the pressure of other interests on the part of the present owner." Just here let it be stated that the agent understood his business. It took him but a short while to convince George that the man and the occasion had met. He explained in detail what a lucky thing it was for a young fellow of George's education, training and standing to find such a rare opportunity to become sole owner of a well-established business for a moderate amount of ready cash. The agent did a little telephoning and it was soon arranged that George was to meet the owner and examine the store at a certain hour of the next day. George was on hand at the appointed time. It cost him \$12 for railway fare and sundry expenses to get there, but he had not supposed that he would find a "cinch" or a "snap" without going to some expense; hence he was not downhearted simply because he had had to use more or less ready cash in ascertaining a few things about his future business establishment. He found the owner of the drug store, a Mr. Brown, busy, with two clerks, waiting on patrons. In fact the store seemed to be quite well filled with well-to-do looking persons who were buying drugs, waiting for prescriptions to be filled, sitting at the ice-cream tables eating ice cream or candy, drinking soda, etc., or waiting as if for a car.

The proprietor had his head clerk produce some books. Brown claimed that he derived from fifty to seventy-five dollars clear profit from the store every week. George could not fathom Brown's system of bookkeeping, and so had to accept the statement as made, especially as the clerk confirmed the figure. Slips indicating the amount of drugs, cigars, ice-cream and other goods sold, were shown, all of which appeared to George to be quite encouraging, so much so that he wondered why Brown should care to dispose of such a good thing. He asked about the stock in the store and was invited to cast his eyes over numerous rows of articles. There were show-cases and cabinets that appeared to be well filled with salable articles. The boxes on the shelves were well arranged and seemed to be complete.

George and Brown did more or less checking of goods. George kept a list on a tablet, while Brown, assisted by a clerk, designated the articles. Brown

and the clerk were pleasant fellows, who smoothed over the rough places. All hands smoked and chatted as they counted articles and supplies. Occasionally a shortage revealed itself in a count, and all laughed, deeming it quite a joke. George had considerable confidence in Brown and his helpers. They did not go over the entire stock, as to do so would have taken two or three days. George told the men that he was satisfied after they had checked up a certain section of the store. He felt that there must be the full value there. The price for which the store with stock and good will was advertised was \$2,500. It seemed to George that there was more value than this in the packages and bottles. There were rows of high-priced extracts and other perfumery on the shelves, and a number of kegs, jugs, carboys and other containers of surplus stock in the basement.

George did not decide that day about buying the store. He wanted to look at some other places first. In three days he returned, and after a few preliminaries the necessary papers were drawn up and he paid over the cash and became for the first time in his life the proud owner of a store. He retained the two clerks. Brown celebrated the occasion by giving all hands a fine dinner at the hotel near by, and then departed.

The store opened for business under the new administration the next morning. Some customers came in and various preparations were called for, a few prescriptions left to be filled. Then the new proprietor discovered that the stock had been tampered with since he had inspected it. He had expected to be able to fill any prescription, but found that a good deal of valuable and useful material had been taken away. It seemed unjust to blame Brown, the genial friend and former owner, so George tried to convince himself that there was a mistake somewhere and that Brown would come back and make it all right. But before many days had passed he was obliged to admit in the parlance of the street that he had been "stung." An investigation revealed to him the fact that on the day he first visited the store the place had been "fixed" for his arrival; that Brown had invited a dozen or more of his acquaintances to come to the store for a treat on ice-cream and soda water, for the purpose of making the establishment appear to be in a flourishing condition. He also found that many of the alleged original packages called off to him by Brown and the clerk when they were "checking up" had been opened and their contents removed; that the "large stock" of expensive perfumes had been so arranged that the full bottles were all in front, while many empty or nearly empty ones were half hidden, and that the supposed surplus stock in the basement was a delusion and a snare. Even the bill for the dinner at the hotel was sent to George, but this he could refuse to pay, and did. He never knew what became of it, but heard later that the hotel owed the store for supplies, and supposed that the two accounts cancelled each other.

One revelation came after another until George finally and reluctantly admitted to himself that he had been neatly "goldbricked." What could be done then? He had paid for the store; Brown did not live in the town, and no one seemed to know where he was. George charged the loss up to "experience." Some of his further experiences are too harrowing to be related, right on top of the foregoing, but he had some that are worth telling.

Good Laboratory Practice.

By WILLIAM MITTELBACH.

The laboratory or druggist's workshop affords excellent opportunities for self education in many ways. No matter how little work is done there in the way of preparing galenicals, yet every single preparation can be used as an object lesson to broaden our views and strengthen our knowledge about the various drugs handled, and their method of combination, Latin and common names, and the cost of drugs can be more quickly and thoroughly learned in the laboratory than elsewhere.

The following practice has been in vogue in my store for several years, and I find it quite a help to those in charge: For instance, when making elixir of iron, quinine and strychnine phosphates, the operator writes out in full the formula as stated in the Pharmacopœia in a book I call the laboratory record, thus:

R Ferri phosphatis solubilis.	Gm.	17.500	cost	.029
Quininæ	Gm.	8.750	"	.158
Strychninæ	Gm.	0.275	"	.014
Acidi phosphorici	Cc.	2.000	"	.002
Ammonii carbonatis	Gm.	9.000	"	.002
Alcoholis	Cc.	60.000	"	.044
Acidi aceticæ	Gm.	28.650	"	.010
Aquæ ammoniæ	q.s.		"	.001
Aquæ destillatæ	q.s.		"	.000
Elixiris aromatici	q.s.		"	.245

Total cost for 1000 Cc. 505
or 1½ cents a fluid ounce.

As is seen, the formula is written in the form of a prescription, and unabbreviated. This is good exercise in Latin writing, and gives the student a fine opportunity to post up on the subject. The cost of each item follows the article. This must be computed accurately in order to arrive at the true cost of the finished preparation. In this case our finished preparation costs us 50½ cents for the 1000 c.c. (mils) or about 24 cents a pint. One of the most popular brands of this elixir costs the retailer \$8 a dozen pints. It is very evident therefore that it pays the druggist to make this galenical. Just so with many other preparations; and besides a saving in cost, we get most valuable experience.

From this record a more condensed tabulation is made on a 4 by 7 bristol board card. These cards are arranged alphabetically in a proper receptacle. The record on this card is as follows.

<i>Elixir Ferri, Quininæ et Strychninæ Phosphatum.</i>				
Date.	Quantity.	Cost.	Made by	Remarks.
11/2/11.	1000 c.c.	.505.	Smith.	Sell for 10c. oz.

Each card will hold about twelve entries, which in the average store means a concise record, on one card, for three or four years.

The value of such practice and records must be apparent to every student of pharmacy. It develops not only scientific and commercial knowledge of the business, but also gives the operator excellent training in neatness, accuracy and system.

Every time a druggist does a little counter prescribing, says the *Pacific Drug Review*, he is injuring his own business and making dispensers out of physicians, for the "patient" will eventually go to the doctor and tell him about the druggist's treatment.

Simple, Accurate Methods of Milk Analysis.

By JOSEPH L. MAYER, PHAR. D.

In view of the ease with which it is possible to obtain speedy and accurate results in the analysis of milk, it is surprising to find so few pharmacists who make such examinations.

The statement that the dispensing druggist has not the apparatus, sufficiently accurate balance or time to undertake the work, is not well founded in view of the following experiments which I made:

To ascertain whether a delicate prescription scale would yield accurate results, a determination of the solids was made, employing a beam dispensing scale and the weights accompanying it. This was one of the scales in daily use in our prescription department.

At the same time a duplicate was run, using the regular analytical balance and weights, with results as follows:

Druggists' scale and weights showed 11.72 per cent. total solids.

Analytical balance and weights showed 11.71 per cent. total solids.

These results are sufficient evidence that in the absence of an analytical balance, the pharmacists' scale may be employed without fear of erroneous results.

Another complaint of the druggist one frequently hears is that he has not a platinum dish to employ for the total solids estimation. To determine whether this could be overcome without sacrificing accuracy, two determinations were made, one by using a platinum dish and the other by employing an ordinary tin cover from a mailing case which had approximately the dimensions of 2¼ inches by ¼ inch. The results obtained were those reported above, the mailing case cover being employed in connection with the druggists' scale and weights, and the platinum dish, in the other process. Thus it is seen that the use of these covers, tin ointment box covers or even lead-tin foil capsules which are listed by apparatus dealers especially for milk analysis, give very accurate results.

The determination of fat is very quickly and accurately made by means of some form of centrifuge. These machines with a set of Babcock milk bottles, pipette, acid measure, etc., can be purchased as low as eight dollars, depending on the number of pockets, this one being made for four.

The specific gravity can readily be determined by means of an accurate urinometer, or else by a lactometer of the New York board of health pattern. The latter form of apparatus has the advantage that it indicates at once whether or not the milk meets the legal standard, as a reading of 100 on the scale indicates that the milk has the legal gravity of 1029. Should the lactometer read 110, it would indicate that it not only met the standard of gravity, but was above it. If, on the other hand, it read 90, it would indicate that the sample fell short of the legal requirement with regard to the specific gravity. These lactometers' chief value is in milk inspection.

The actual determinations usually required in connection with milk analysis are as follows:

SPECIFIC GRAVITY.

The specific gravity is taken with the urinometer above referred to, care being taken to have the milk at 60° F. Should the milk have some other tempera-

* Read at the March, 1911, meeting of the Kings County (N. Y.) Pharmaceutical Society, and contributed by the author.

ture, a reference to a standard table found in the books will aid in making the correction, although a simpler way is to bring the milk to the proper temperature.

FAT DETERMINATION.

Fat is determined by means of the Babcock apparatus above referred to, full directions concerning the use of which accompany the machine. This small apparatus is hand geared and requires nothing but the apparatus and commercial sulphuric acid. The entire time required to measure the milk, centrifuge, and complete the analysis is not more than fifteen minutes. If but a few determinations are to be made it is well to run duplicates.

TOTAL SOLIDS.

Total solids are determined by accurately weighing two platinum dishes, mailing case covers, or tin ointment box covers, and after noting their weight, accurately weighing into them 5 grammes of the sample. They are then placed on a water bath (with a piece of filter paper over the hole in the bath to prevent dirt from the water being deposited on the bottom of the dish), after three hours taken off, the outside of the dish wiped dry with a cloth, and weighed. Since 5 grammes of milk were taken the results obtained multiplied by twenty will give the percentage of total solids.

WATER.

Deducting the percentage of total solids from one hundred will give the percentage of water.

FORMALDEHYDE.

Formaldehyde is readily detected by means of Hehner's test—sulphuric acid and ferric chloride. As pointed out by Lyons (Proceedings of the American Pharmaceutical Association for 1905, page 326), the ratio of the reagents makes a great difference in the results. Acting upon his suggestion I find that 1 volume of tincture of ferric chloride to 25 volumes of sulphuric acid, always yields satisfactory results; this is employed by placing about 4 c.c. (mils) of the reagent in a test tube and carefully floating the milk on top. A violet zone indicates formaldehyde. LaWall (Proceedings of the American Pharmaceutical Association for 1905, page 327) makes the very valuable statement that this test gives the most distinct reactions with the weakest formaldehyde solutions. My own work on the subject has confirmed this. If sufficient formaldehyde is present to be recognized by the odor, it is necessary to dilute the sample to obtain results.

BORAX.

Borax is detected by the method of La Wall and Bradshaw, which is as follows: Pour the milk into a small watch glass, carefully add 10 per cent. hydrochloric acid until the reaction is acid to blue litmus paper, then add about 5 drops of tincture of turmeric (prepared as directed under "Indicators" in the Pharmacopœia) and evaporate to dryness on a water bath. If boric acid is present, the residual film produced will have a red color directly proportionate to its amount. (Proceedings American Pharmaceutical Association for 1907, page 839).

CARBONATES AND BICARBONATES.

Carbonates and bicarbonates are readily detected by the effervescence produced on adding an acid to the ash. If the ash has not been determined, a satisfactory method is that of Schmidt: Ten c.c. (mils) of milk are mixed with an equal volume of alcohol

and a few drops of 1 per cent. solution of rosolic acid added. A rose-red color indicates carbonates or bicarbonates. Pure milk yields a brownish-yellow color. (Allen's Organic Analysis, second edition, volume IV, page 183.)

It is a good plan to run a blank with pure milk.

It is hardly necessary to make mention of the fact that it is essential to mix the sample thoroughly before making the various determinations. In addition to the foregoing determinations, milk analyses sometimes include the estimation of ash, proteids, and milk sugar, and qualitative tests for caramel, anilin orange, and annatto. In addition, a bacteriological examination is frequently made.

The determinations above referred to are those which are required to determine whether the sample meets the legal requirements. Section 53 of the sanitary code of the board of health of the department of health of the city of New York defines the term "adulterated milk" as follows:

First, milk containing more than 88.5 per cent. of water or other fluid.

Second, milk containing less than 11.5 per cent. of milk solids.

Third, milk containing less than 3 per cent. of fats.

The United States standard defines milk as follows: "Contains not less than 12 per cent. total solids, not less than 8.5 per cent. solids not fat, and not less than 3.25 per cent. of milk fat." (United States department of agriculture, circular thirteen, page 7.)

In addition, the pharmacist who has occasion to use any quantity of milk at his fountain has a simple, accurate index to the quality of milk being supplied him and in this way may guard against what sometimes assumes the proportion of a large-sized business leak. Take, for example, a heavy cream, used by pharmacists who make their own ice cream, which is often bought on a basis of 40 per cent. of fat at a fixed price for each percentage of fat. If the sample should run 24 per cent. instead of 40 per cent. it is easy to see the financial loss.

A talk on milk analysis, however short, would be incomplete did it neglect to include mention of the various tables in use for doing milk analysis by calculation. The results which are remarkably close are obtained as follows:

The specific gravity is accurately determined as above described and the fat estimated by means of the centrifuge, then employing Richmond's formula (Allen's Organic Analysis, second edition, volume IV, page 165)—

$$T = 1.2 F \text{ plus } 0.14 \text{ plus } 0.25G.$$

(T. = total solids; F. = fat; and G. = gravity, that is, the excess above 1, with the decimal point moved three places to the right.)

For example, a sample of milk at 60° F. had a specific gravity of 1.0304, and contained 4.4 per cent. of fat; then, by applying the rule, we ascertain the percentage of total solids in this sample as follows:*

$$\begin{array}{rcl} T = 1.2 F & (1.2 \times 4.4) = & 5.28 \\ \text{plus} & & .14 \\ \text{plus } 0.25G. & (0.25 \times 30.4) = & 7.60 \end{array}$$

Percentage of total solids 13.02

The figures for total solids obtained on this milk

*The equation must be read as a whole, not line by line.

using the gravimetric method were 12.86 per cent. If on the other hand the percentage of fat is desired and the figures for specific gravity and total solids are at hand, the following formula is employed:

$$F = (T - [0.14 + 0.25G]) \div 1.2.$$

For example, employing the above figures, we ascertain the percentage of fat as follows:*

Total fat = T =	13.02
minus (0.14 + 0.25G) = 0.14	
plus 0.25 × 30.4 = 7.60	7.74
	5.28
divided by 1.2 (5.28 ÷ 1.2)	
= percentage of fat =	4.40

There are various tables in use whereby it is simply necessary to make the determinations and a reference gives the desired figures. Or a more convenient plan is to use the milk-scale devised by Richmond, which is constructed on the principle of the slide rule.

Recently Olsen (*Journal of Industrial and Engineering Chemistry*, volume 1, number 4, page 253) has published a new method for the calculation of the proteins in milk and incidentally the calculation of all the constituents based upon the determination of nothing but the fat and specific gravity. His rule is—

$$P (\text{proteins}) = T - (T \div 1.34).$$

For example, a sample contains 11.25 per cent. of total solids. To ascertain the proteins, proceed thus*—

P = T =	11.25
minus 11.25 ÷ 1.34 =	8.39
	2.86

Percentage of proteins.

The actual analysis showed 2.84 per cent.

Then, if in a sample of milk we determined the specific gravity and the fat, it would be but necessary to calculate the total solids and proteins, and taking the ash of milk as 0.75 per cent., calculate the milk sugar by difference, and in this manner calculate the complete analysis merely from the figures on fat and specific gravity. For example, a milk analysis calculated yielded the following results:

Fat	4.40 per cent.
Proteins	3.23 per cent.
Ash	.75 per cent.
	8.38 per cent.
Total solids	12.88 per cent.
Less the	
above	8.38 per cent.
Shows	4.50 per cent. of milk sugar.

Then we have—

Fat	4.40 per cent.
Proteins	3.23 per cent.
Milk sugar	4.50 per cent.
Ash	.75 per cent.

Total solids	12.88 per cent.
Water (by difference)	87.12 per cent.

100.00 per cent.

As a result of the simplicity of the apparatus and methods of analysis, accuracy of results, demand for the work and financial gain associated with it, the subject of milk analysis by the pharmacist is one which has everything to commend it.

*The equation must be read all together, not line by line.

Physicians' Financial Interest in Official Preparations.*

By B. S. GUARDIAN.

Mr. Chairman and Gentlemen of the ———: I come to you as a representative of the ——— to ask you what you are going to do to put a stop to the further spreading out of the 10-cent medical societies, to promise you our aid in fighting them, and to suggest ways of doing it successfully.

I need not dwell upon the harm done by these 10-cent societies; you feel it all, all except the very few at the top of the medical ladder, and you feel the harm done more than we pharmacists do, as with us the prescription trade is but a part of our business, while with you, gentlemen, it is almost all your stock in trade—the more reason for you to try to put a stop to this plague.

Now, these 10-cent societies recruit their victims among the very poor mostly (barring exceptions that can be practically disregarded); the poor flock to these societies because they cannot afford to pay the regular fee of \$1 or \$2, and then as much more to have the prescription filled. Well, it seems to us pharmacists that this can be partly remedied by you, gentlemen, prescribing drugs that are not expensive though just as efficient as the dearer kind.

For instance, we do not see the reason for the physician to prescribe for poor people a proprietary brand of hexamethylenamine at \$1 an ounce instead of the official article at \$1 a pound; or a much-advertised antiseptic powder sold at an exorbitant price, when the powder made according to the National Formulary will answer every purpose and has this advantage: When its formula is changed you are notified. Nor do we see why in prescribing solution of hydrogen dioxide you specify a brand and thereby compel your patients to pay for the solution and for the advertising it has received in the papers; or why make them pay a fancy price for an alkaline antiseptic solution with a fancy name, when a more trustworthy preparation at a lower price is just as accessible.

By prescribing these expensive varieties of drugs and preparations official in the United States Pharmacopoeia or the National Formulary you raise not only the price of the particular prescription you are writing but raise prices all around, because you have us invest a considerable part of our working capital in varieties of drugs that are but seldom used.

And then, gentlemen, almost each and every physician has his favorite brands; it is not only hexamethylenetetramine of the U. S. P. variety we have to keep in stock, but also many duplicates of it under fancy names; and the same remarks apply to other chemicals on our shelves.

And what about this continuous specification of different brands of the same official preparation? One physician favors Jones', another one Brown's, a third Smith's, a fourth Robinson's, and so on ad infinitum. Gentlemen, you very often compel us to keep in stock several brands of the same elixir or syrup, and who

*This paper was prepared by its author to be read by him as a representative of a Brooklyn pharmaceutical body before a neighboring medical society as an introduction to a general debate on the subject treated, but for reasons of a purely local character the author was prevented from delivering his message, and so has contributed it to the CIRCULAR.—Editor THE DRUGGISTS CIRCULAR.

is going to pay for the thus increased cost of running our pharmacies, who but the patients.

Now, gentlemen, we pharmacists have studied pharmacognosy for years, every one of us; we handle and dispense drugs continuously and, with all respect to your knowledge in pharmacodynamics, we think that we are better qualified to judge the quality of the drugs than the average physician. And we are not sure whether it is right to discriminate between one reputable manufacturer and another of equal standing, any more than it would be to discriminate between one reputable pharmacist and another of equal merits, or any more than it would be for the pharmacist to discriminate between one physician and another.

Gentlemen, such excellent drugs as aconite, belladonna, ipecac, nux vomica and opium have all been standardized alkaloidally by the Pharmacopœia makers, and no matter what brand you are prescribing you are getting but the U. S. P. kind. The bromides, iodides, and salicylates, the salts of bismuth, mercury, iron, and quinine are all U. S. P. and can be relied upon.

Before closing my address I will take the liberty of reminding you, gentlemen, that the United States Pharmacopœia and the National Formulary are providing you with a grand list of very effective though inexpensive preparations to meet almost any demand. I will mention but a few for the sake of illustration: Compound tincture of gentian, elixir of iron, quinine and strychnine, compound syrup of hypophosphites, Lassar's zinc-salicyl paste, gall and opium ointment and last but not the least, as a vehicle and a diluent, aromatic elixir, for which we do not charge \$1 a bottle.

Gentlemen, members of the ———, when you take up our suggestion that you prescribe effective though inexpensive drugs and preparations, then and only then every prescription of yours will be a nail driven into the coffin wherein we will lay to rest the corpse of the 10-cent medical business.

To Convert Thermometer Readings.

A correspondent of the *Lancet* (London) offers a new alternative method of converting degrees Centigrade into degrees Fahrenheit, which may be found easier to perform mentally than the usual method, because the factors can be more easily retained in the memory. This method consists of multiplying the centigrade figures by 2, deducting one-tenth of the product, and adding 32. Example (a), $30^{\circ}\text{C.} = 86^{\circ}\text{F.}$ Method: $30 \times 2 = 60$. $60 - 6 = 54$. $54 + 32 = 86$. Example (b), $37^{\circ}\text{C.} = 98.6^{\circ}\text{F.}$ Method: $37 \times 2 = 74$. $74 - 7.4 = 66.6$. $66.6 + 32 = 98.6$. Example (c), $40^{\circ}\text{C.} = 104^{\circ}\text{F.}$ Method: $40 \times 2 = 80$. $80 - 8 = 72$. $72 + 32 = 104$.

Palatable Draught of Epsom Salt.

Haldeman (*Physicians' Drug News*) offers the following formula as representing a palatable form of administering magnesium sulphate:

Magnesium sulphate..... 1 ounce.
Solution of saccharin..... 1 dram.
Oil of peppermint..... 2 drops.
Oil of anise..... 2 drops.
Water..... enough to make 2 ounces.

Dissolve the sulphate in the water and add the other ingredients; filter.

Some Suggestions Anent N. F. Preparations.

At the February meeting of the Washington branch of the American Pharmaceutical Association the following formulas and processes were submitted as improvements on the respective recipes found in the National Formulary:

Alkaline Antiseptic Solution.

I.	
Potassium bicarbonate.....	32.0 grammes.
Sodium benzoate.....	8.0 grammes.
Sodium borate.....	32.0 grammes.
Thymol	0.2 gramme.
Eucalyptol	0.2 gramme.
Oil of peppermint.....	0.2 gramme.
Oil of birch.....	0.4 gramme.
Cudbear	2.0 grammes.
Alcohol	60.0 c.c. (mils).
Glycerin	250.0 c.c. (mils).
Purified talc.....	10.0 grammes.
Water.....	enough to make 1000.0 c.c. (mils).

Dissolve the salts in 600 c.c. (mils) of water, and the thymol, eucalyptol and oils in the alcohol. Mix the alcoholic solution with the glycerin; add the solution of the salts and enough water to make 1000 c.c. (mils). Add the cudbear and the purified talc; shake occasionally during three days, and then filter, returning the first portions until the filtrate passes brilliantly clear.

II.	
Potassium bicarbonate.....	32.0 grammes.
Sodium benzoate.....	8.0 grammes.
Sodium borate.....	32.0 grammes.
Thymol	0.2 gramme.
Eucalyptol	0.2 gramme.
Oil of peppermint.....	0.2 gramme.
Oil of birch.....	0.4 gramme.
Alcohol	60.0 c.c. (mils).
Glycerin	125.0 c.c. (mils).
Cudbear	2.0 grammes.
Purified talc.....	15.0 grammes.
Tincture of cardamom.....	10.0 c.c. (mils).
Water.....	enough to make 1000.0 c.c. (mils).

Aromatic Syrup of Eridictyon.

Fluidextract of eridictyon.....	32.0 c.c. (mils).
Solution of potassium hydroxide..	25.0 c.c. (mils).
Compound tincture of cardamom..	65.0 c.c. (mils).
Oil of sassafras.....	0.5 c.c. (mils).
Oil of lemon.....	0.5 c.c. (mils).
Oil of cloves.....	1.0 c.c. (mils).
Alcohol	32.0 c.c. (mils).
[Sugar?]	
Water.....	enough to make 1000.0 c.c. (mils).

Dissolve the oils in the alcohol and add the fluidextract and the tincture. Then add the solution of potassium hydroxide and 325 c.c. (mils) of water, shake the mixture thoroughly and filter. If the filtrate is not perfectly clear add 5 grammes of magnesium carbonate; shake thoroughly and again filter until clear. Finally pour enough water through the filter to obtain 500 c.c. (mils) of filtrate. Pour this upon the sugar contained in a bottle, and effect solution by placing the bottle in hot water and agitating it frequently. Lastly cool the product, and add enough water, passed through the filter previously used, to make 1000 c.c. (mils).

Essence of Pepsin.

I.	
Rennin	16.50 grammes.
Pepsin	22.50 grammes.
Lactic acid.....	2.00 c.c. (mils).
Tincture of sweet orange peel....	15.00 c.c. (mils).
Oil of nutmeg.....	0.05 c.c. (mil).
Vanillin	0.05 gramme.
Glycerin	150.00 c.c. (mils).
Alcohol	200.00 c.c. (mils).
Purified talc.....	15.00 grammes.
Distilled water.....	enough to make 1000.00 c.c. (mils).

Dissolve the pepsin and rennin in 500 c.c. (mils) of distilled water to which the lactic acid has been added, and then add the glycerin and the alcohol to which has been added the tincture of sweet orange peel, the oil of nutmeg and the vanillin. Shake after each addition, and finally add sufficient distilled water to make 1000 c.c. (mils) of product. Add the purified talc; mix thoroughly and filter.

II.

Pepsin	22.00 grammes.
Rennin	4.00 grammes.
Oil of orange.....	1.00 c.c. (mil).
Hydrochloric acid.....	1.00 c.c. (mil).
Glycerin	200.00 c.c. (mils).
Alcohol	200.00 c.c. (mils).
Purified talc.....	15.00 grammes.
Distilled water.....	enough to make 1000.00 c.c. (mils).

Compound Elixir of Pepsin.

Pepsin (soluble scale or granular) ..	15 grammes.
Lactic acid.....	1 c.c. (mil).
Hydrochloric acid.....	2 c.c. (mils).
Glycerin	250 c.c. (mils).
Alcohol	200 c.c. (mils).
Oil of orange.....	2 c.c. (mils).
Cudbear	1 gramme.
Distilled water.....	enough to make 1000 c.c. (mils).

Mix the acids with the glycerin and 500 c.c. (mils) of distilled water; add the pepsin, and macerate, with occasional agitation, until solution is effected. Then add gradually the alcohol in which the oil of orange has been dissolved, agitating after each addition. Now add the cudbear and sufficient distilled water to make the preparation measure 1000 c.c. (mils); macerate for six hours with occasional shaking, and filter.

Red Elixir of Pepsin.

Pepsin	15.00 grammes.
Hydrochloric acid.....	1.00 c.c. (mil).
Glycerin	200.00 c.c. (mils).
Alcohol	200.00 c.c. (mils).
Oil of orange.....	0.50 c.c. (mil).
Oil of lemon.....	0.50 c.c. (mil).
Sugar	150.00 grammes.
Cudbear	1.00 gramme.
Purified talc.....	15.00 grammes.
Distilled water.....	enough to make 1000.00 c.c. (mils).

Solution of Aluminum Acetate.

Aluminum sulphate.....	300 grammes.
Acetic acid.....	300 grammes.
Calcium carbonate.....	130 grammes.
Water	1000 c.c. (mils).

Dissolve the aluminum sulphate in 800 c.c. (mils) of cold water, and filter; gradually add the calcium carbonate previously mixed with 200 c.c. (mils) of water; then add the acetic acid in divided portions. Allow the resulting mixture to stand for twenty-four hours, at ordinary temperature, with occasional stirring. Finally decant the supernatant clear solution.

Stokes' Liniment.

Oil of turpentine.....	200 c.c. (mils).
Oil of lemon.....	8 c.c. (mils).
Acetic acid.....	40 c.c. (mils).
Rose water.....	170 c.c. (mils).
Fresh eggs.....	enough

Triturate the white and yolk of one egg and the yolk of another with the oil of turpentine and the oil of lemon in a mortar until they are thoroughly mixed. Then incorporate the acetic acid and the rose water. Shake the mixture, whenever any of it is to be dispensed.

Commenting on two formulas for elixir of terpin hydrate appearing in the CIRCULAR for last month, page 136, P. Henry Utech, Meadville, Pa., writes:

Permit me to offer a friendly criticism of both formulas.

The first formula—the one suggested by Prof. E. Fullerton Cook—is quite objectionable therapeutically on account of its high alcoholic content—considerably more than double that of the present N. F. product. This elixir is given largely to children, and if anything like an average expectorant dose of Prof. Cook's product were administered, excessive stimulation would result. The second formula—that of Mr. F. W. A. Hain—is, in my opinion, the better of the two, but inasmuch as his vehicle is glycerin, the preparation made according to this formula could not properly come under the head of elixirs—rather is it a glycerole of terpin hydrate.

With the idea of overcoming some of the objectionable features of the N. F. product, some years ago I began a series of experiments which resulted in the formulation of the following recipe, which first appeared in the Proceedings of the Pennsylvania Pharmaceutical Association for 1908:

Elixir of Terpin Hydrate.

Terpin hydrate (in powder).....	256 grains.
Acetic acid.....	80 minims.
Tincture of sweet orange peel.....	2 drams.
Alcohol	8 ounces.
Glycerin	4 ounces.
Aromatic elixir.....	enough to make 16 ounces.

Dissolve the terpin hydrate in the alcohol, to which the acetic acid has been previously added, by the aid of a gentle heat. Then add the tincture, and lastly sufficient elixir to make 16 ounces.

The addition of acetic acid increases the solubility of the terpin hydrate and enhances the therapy of the preparation.

The advantages of this preparation are: First, it exhibits an amount of medicament with a minimum of alcohol. Second. Its permanence; it will not throw down a precipitate even when exposed to a freezing temperature; specimens have stood on my shop shelves for over a year in perfect condition. Third. Its superior miscibility; it can be administered with resinous tinctures, etc., and remain permanent. Fourth. Its efficaciousness, on account of increased strength and the addition of acetic acid.

Spring Tonics for Live Stock.

In Farmer's Bulletin 430 of the United States department of agriculture, the following formula is given for a condimental stock food, with the statement that it has the recommendation of the Vermont and Maine experiment stations:

Ground gentian.....	1 pound.
Ground ginger.....	¼ pound.
Powdered saltpeter.....	¼ pound.
Powdered iron sulphate.....	¼ pound.

One tablespoonful to be given in the feed once daily for ten days and for ten more days after an interval of three days.

The Iowa station suggests the following formula for a cattle condiment, which, the director naively remarks, will not take the place of common sense and intelligence in the feeding of domestic animals:

Fenugreek	8 pounds.
Ginger	8 pounds.
Gentian	8 pounds.
Sulphur	8 pounds.
Salt peter	8 pounds.
Rosin	8 pounds.
Cayenne pepper.....	4 pounds.
Flaxseed meal.....	44 pounds.
Wood charcoal.....	20 pounds.
Common salt.....	20 pounds.
Wheat bran.....	100 pounds.

Mrs. Price's Canning Compound.

The *Journal of the American Medical Association* reports an examination, in the association laboratory, of Mrs. Price's canning compound, sold on the claim that it will "prevent canned fruits and vegetables from souring and spoiling." The qualitative tests made indicated the presence of a borate, a chloride, a benzoate, and sodium. Further experiments and the quantitative estimations indicated that the constituents found existed as boric acid, sodium chloride and benzoic acid (possibly in part as benzoate), the boric acid amounting to nearly 95 per cent. of the mixture. The *Journal* remarks: "The housewife who uses this mixture does so, of course, not knowing that the chemical she is putting into her foods has been declared injurious as a food preservative by the federal government. Neither does she realize that she is paying for what is essentially boric acid, worth 15 cents a pound, at the rate of \$1.60 a pound."

Physiological Laboratory Notes.

WARNING AGAINST A CERTAIN TEST FOR SPIROCHÆTA PALLIDA.

Borach (*Journ. Am. Med. Asso.*) finds misleading the india ink method of testing for spirochæta pallida. This method first recommended, he says, by Burri, consists in mixing the serum with diluted liquid india ink on a slide and allowing it to dry in the air. In a case in which there was a possibility of syphilis the author had taken a drop of serum from a vesicle and mixed it with india ink for examination. To his surprise he saw at first sight what he supposed were spirochetes. Closer scrutiny of these objects, however, made it dubious as to their actually being spirochetes. It then occurred to him that whatever they might be, before supposing them to have come from the serum of the vesicle, it would be well to examine the pure ink. This he did and found that the same wavy fibers were present. He exhibited the pure ink specimens to a number of laboratory workers, and all agreed that the non-critical and inexperienced observer might easily mistake these for spirochetes. A number of india inks of the market were examined by the author in collaboration with Holliday and all were found to give more or less deceptive appearances. The author adds that "since the accurate determination of the presence of spirochæta pallida is at present already often complicated by the presence of spirochæta refringens, to use the india inks would be to add one more source of error. The spirochete-like objects seen with these inks seem capable of assuming various shapes and sizes, and while most of them, by the experienced microscopists, would not receive very serious consideration, some of the specimens that I have come across at a magnification of 1,300 diameters and higher, could delude even the expert."

A SIMPLE TEST FOR BILIRUBIN.

Bilirubin can be identified in a dilution of 1:100,000 according to Guenther (*Med. Klin.*) by the following method: About 5 c.c. (mils) of glacial acetic acid are boiled with a small amount of magnesium peroxide (about 0.005 gramme) and mixed with a few drops of dark icteric urine previously made strongly alkaline with caustic potash. (Of light-colored alkaline urine 5 to 10 c.c. [mils] should be used for the reaction.) In the presence of bilirubin an emerald-green color will be produced at once or after heating for a short time. By the addition of hydrochloric acid the green color changes to blue. The coloring matter is soluble in chloroform, thus differing from biliverdin and biliprasin, which are insoluble in this liquid.

TEST FOR BILE IN THE GASTRIC CONTENTS.

Woldert (*Journ. Am. Med. Asso.*) in making chemical analyses of the gastric juice siphoned off an hour after a test meal, frequently observed that the specimen before and after filtration would have a decided greenish tint, suggesting either bile or gastrostia fungosa (mold in the stomach) and on testing some of this filtered gastric juice for bile by the nitrous acid method no reaction would be given. Finally the filter paper in such a case was laid aside and allowed to dry. Four days later the paper still had a greenish appearance, especially around the edges. On moistening these greenish areas with nitrous acid the author observed the play of colors characteristic of the bile reaction, the green color first changing to a faint reddish

tint, which lasted a few seconds, then being followed by blue, and after two to five minutes changing to a brownish tint. Thinking that the same reaction could be perhaps obtained by using the filtered gastric contents, he passed some of it back through another piece of white filter-paper, and, when the paper was thoroughly dry, applied the nitrous acid test as before, but obtained no reaction, owing, no doubt, to the fact that the viscid bile had not passed through the filter paper in sufficient quantity to respond to the nitrous acid test. This reaction on the filter paper is best observed in a somewhat shaded portion of the room.

ESTIMATION OF HEMAPHEIN IN URINE.

For diagnostic and prognostic research it is very important that in the examination of urine hemaphein be not confounded with urobilin. The reagents heretofore applied for the detection of the former, namely, amyl alcohol or acetic ether in the presence of hydrochloric acid, cannot be well recommended as they partially destroy the pigment. Florence (*Journ. pharm. chim.*) has obtained good results by using acetone for the isolation of hemaphein. He proceeds as follows. A convenient quantity of red-colored urine is mixed well in a separator with one-fifth its volume of acetone and an excess of ammonium sulphate. When the liquids have separated, the urine, saturated with ammonium sulphate, is drawn off, the acetone washed with a saturated solution of the ammonium salt to remove urea, acids, etc., and after dehydrating by shaking with dry ammonium sulphate, evaporated in vacuo. The residue left after evaporation is dissolved in absolute alcohol, the solution filtered and evaporated again. From the combined pigments, thus obtained, the urobilin is extracted by chloroform, when red-colored hemaphein remains undissolved. Unlike urobilin, hemaphein does not produce a band in the spectrum nor does it yield a fluorescence with zinc salts.

CLARIFYING URINE.

Garcia (*Bull. Assoc. Chim. Sucre*, through *Rép. de pharm.*) has examined the various methods recommended for clarifying urine before subjecting it to the tests for albumin, and has found that by applying infusorial earth, tripoli or lead dioxide, clear filtrates can be obtained, but most of the albumin present is absorbed by these substances. Only pumice stone, precipitated silicic acid, and litharge do not retain the albumin.

COLOR REACTION OF CHOLIC ACID.

The following color reaction for cholic acid has been found by Hammarten (*Zeit. physiol. Chem.*). The acid is shaken with hydrochloric acid (25 per cent.) in a glass stoppered bottle at ordinary temperature, when the mixture will acquire a yellow or yellowish-green color. Within 4 to 8 hours this color turns to a bluish-violet and after standing for 24 hours the mixture will have assumed a beautiful violet color.

Oil of Turpentine Adulterated with Copal.

Vaubel (*Apoth. Zeit.*) has found oil of turpentine which had been adulterated with copal. Owing to the non-volatile character of copal and its peculiar odor and acid reaction it can easily be detected in the residue which is left after distilling the oil of turpentine. The present high price of the oil will doubtless induce much adulteration.

Abstracts

Production of Clean Milk.

Heinemann (*Hoard's Dairyman* through *Journ. Am. Med. Asso.*) says that unfortunately heretofore certified milk has been produced at little or no profit, chiefly because of lack of demand and the higher price charged for it. It is generally marketed by dairies with considerable capital, and occasionally from philanthropic motives, so that it is a belief among the ordinary producers that only a rich man or a crank will attempt to produce it. He believes that this is a misconception; that clean milk can be produced advantageously, and that even certified milk can be produced with a small outlay of money. He cites the instance of a dairy in Wisconsin which markets in Chicago, 100 miles away, milk with a bacterial content of less than 2,000 bacteria per cubic centimeter—in many instances less than 1,000—which returns a fair profit on the investment with milk at six cents a quart in bottles at the farm. This dairy has only thirty cows and produces 250 quarts of milk per day. It has been fitted up with the equipment and supplies of a modern sanitary dairy—cement floors, stalls and stanchions, water-supply, washing and sterilizing machines, bottling machine, bottles, cooling apparatus, pails, cans, etc.—for less than \$1,650. There is abundant light and ventilation in the stables, and every detail of clean milk production is carried out rigorously. The author believes that this example forms a justifiable basis for the assumption that certified milk can be produced with a small investment at a profit if the owner or superintendent will look after each detail with proper care and intelligence, and that for the production of a milk of exceptional cleanliness and quality, even if not up to the standard of certified milk, a much smaller investment than the estimate given would be sufficient. On account of the interest aroused by sanitarians and scientists in this subject, the public will soon demand of all milk-producers milk of this standard.

Danger of Ethyl Chloride as an Anesthetic.

Wood (*Journ. Am. Med. Asso.*) points out the misleading character of statistics in the case of danger from ethyl chloride as an anesthetic. Combining those given by two different observers a mortality of 1 in 5,170 is shown. The statistics on ether and chloroform of Coates, Gould, Garee, Gurlt and others covering several million cases, give a mortality from chloroform of about 1 in 3,500, and from ether, 1 in 15,000. But while from the statistical standpoint, ethyl chloride would seem to stand between ether and chloroform, but close to the latter, this conclusion is unfair, says the author, because the anesthetics by ethyl chloride have practically all been of but a few minutes' duration, and the secondary dangers which occur as a result of prolonged anesthesia and which have caused a considerable bulk of the fatalities of ether and of chloroform do not come into consideration in the case of ethyl chloride. Ethyl chloride on account of the quickness and fugaciousness of its action, enters into competition with nitrous oxide gas rather than with ether. If we set alongside of the commonly accepted mortality for nitrous oxide, 1 death in 1,000,000 anesthetics, and the figures for ethyl chloride, 1 in 6,000, the danger of this agent is evident.

The Dust Nuisance in Street and House.

Under this heading the *Boston Medical and Surgical Journal* writes: "Nothing further seems to be heard nowadays about the campaign against promiscuous expectoration in Boston. Its place in popular interest has apparently been taken by the agitation against the dry sweeping of streets, a practice long recognized by physicians as abominable, but recently brought into public prominence by various interviews on the subject published in the daily press. There can be no doubt that clouds of dust, whether stirred up by sweeping or by the wind, are a disagreeable and dangerous irritant to the respiratory tract and predispose it to infection by various organisms. It is probable that city dust also disseminates numerous pathogenic bacteria, notably those of tuberculosis. The great increase of colds, influenza, pneumonia and other respiratory infections during dry, windy weather when there is no snow on the ground is evidence in the experience of every medical practitioner that dust is a factor in their production. Various methods have been suggested to check the dust nuisance, such as sprinkling the streets with oil or with calcium chloride solution, sweeping them wet instead of dry, and hooding the sweepers with canvas covers. Popular discussion of the problem is likely to produce some good. Incidentally it would be still better if this campaign, carried into the home, should lead to the abolition of that pernicious domestic fallacy, sweeping-day, which still survives to be the curse of many a New England household."

Alcoholism and Tuberculosis.

Lister (*Med. Press*) is of opinion formed after an experience of many years that among the most common conditions found associated with consumption is that of alcoholism. At one time, and not so long ago, it used to be the custom to give alcohol in somewhat large quantities to phthisical patients. The administration of alcohol combined with overfeeding used to be the routine practice in Nordrach Sanatorium; this, however, is now discontinued. In the opinion of the author alcoholism is very closely allied to the causation of tuberculosis, and in the prognosis of the disease he thinks it may be accepted as an axiom that the chronic alcoholic does not materially benefit by any amount of treatment. For instance, studies of mortality statistics show that the list of occupations suffering most from alcoholism almost coincides with the list of occupations in which phthisis figures most significantly.

Blindness from Atoxyl.

It has been known for some years that the use of atoxyl and similar arsenic preparations is attended with risk to the eyesight. Steindorff (*Berl. klin. Woch.* through *Cal. State Journ. Med.*) from a careful search of the literature has been able to collect as many as 95 cases of disturbances of vision or actual blindness following the use of atoxyl. Stopping the drug after symptoms have appeared does not check the progress of atrophy of the optic nerve which it induces, nor does other treatment seem to have any effect for improvement. An eye already the subject of disease often shows an increase in development of the original disorder.

Electric "Catapasm."

Marcuse (*Nouv. Rem.* through *Pharm. Journ.*) has for some time employed a device of Hilzinger for the direct application of heat to various parts of the body, using electricity as the source of heat. These electric "cataplasms" are composed of soft pliable knitted fabric containing a system of resistance wires. Insulation is obtained by means of glass beads. The wires are placed between layers of asbestos. The apparatus can be attached to any source of current, not exceeding 120 volts in tension, and they can be exactly adjusted to any required degree by regulating the flow of current. The "cataplasms" are made of different shapes to fit different parts of the body.

Infusion of Digitalis.

According to Hertzfeld (*Pharm. Centralb.* through *Chem. and Drug.*) an infusion of digitalis representing all the activity of the leaves can be made as follows: Free the leaves from stalks and veins; finely powder the residue, and add the water, keeping the infusion at a temperature of 50° C. for one hour. Allow the infusion to cool to 32° C. and add 10 per cent. of alcohol. After it has stood for twelve hours, filter, express, and make up to the quantity with water.

Detection of Arsenic Acid in Presence of Phosphoric Acid.

Maderna (*Chem. Zent.* through *Journ. Soc. Chem. Ind.*) proposes the following method for the detection of arsenic acid in the presence of phosphoric acid. A small quantity of a solution containing the alkali salts of the two acids is rendered faintly acid with acetic acid, treated with 10 to 15 c.c. (mils) of a concentrated solution of ammonium nitrate, then heated to incipient boiling, and about 1 gram of solid ammonium molybdate added. After the molybdate has dissolved, the solution is boiled for a minute and a half, the presence of arsenic acid being indicated by the formation of a white precipitate of arsenomolybdate. It is stated that 0.002 gramme of arsenic acid can be detected even in presence of large quantities of phosphoric acid. Calcium, strontium, and magnesium salts render the reaction less delicate, but do not prevent it.

Physostigmine in Poisoning by Magnesium Sulphate.

Joseph and Metzger (*Journ. pharmacol.*) are convinced by careful research that physostigmine is capable of efficiently antagonizing some of the toxic actions of magnesium salts. It may directly serve as a life-saving agent against fatal poisoning by magnesium salts, if the dose of the latter employed be not too large. Physostigmine overcomes the toxic effects of magnesium essentially by the aid it renders to the depressed function of respiration. This aid is of three-fold origin. It stimulates the respiratory center; it antagonizes the "curare-like" action of the magnesium-ion on the nerve endings of the pneumogastric nerves within the lungs; physostigmine antagonizes also the magnesium action on the peripheral nerve endings and probably also the action on muscle tissue. The extent of this antagonism, however, seems to be not very significant.

Calmine: Risks from Such a Preparation.

The *Journal of the American Medical Association* mentions a preparation sent out as a new and specially valuable hypnotic, under the name of calmine. It is, says the *Journal*, nothing more than the sodium salt of veronal, "from which it differs only in that the combination with sodium has made it more readily soluble, and thus it is claimed its absorption is more rapid. It is also sold as medinal. Veronal is protected abroad by a trade-mark and in this country by a patent, and this is undoubtedly the cause of the introduction of the sodium salt under these fanciful names. This is probably only the beginning and we may look for it under a host of other names with the usual results that thoughtless physicians who have had poor results with it under one name will try it under others. Or, worse still, they may combine veronal with calmine or with medinal in the same prescription, thus giving a dangerous dose."

Organization Against Tuberculosis.

To show the rapid spread of the work against tuberculosis, the *Boston Medical and Surgical Journal* gives figures to show the relative number of sanatoria and hospitals for tuberculosis, special dispensaries for its treatment, and anti-tuberculous organizations in the United States in 1904 and 1910. From these figures the appended table is made up:

	1904.	1910.	In-crease in num-ber.	In-crease per cent.
Sanatoria and hospitals..	133	400	267	200
Special dispensaries.....	32	300	268	838
Organizations	39	450	411	1,054

— It seems that the campaign of education concerning the great white plague is showing results well worth while.

Magnesium Sulphate in Tetanus.

Fox (*Med. Rec.*) reports a case of tetanus in which after treatment with antitetanic serum without effect the patient continuing to grow worse, it was decided to use magnesium sulphate intraspinally. Two cubic centimeters of the cerebrospinal fluid were withdrawn by lumbar puncture and an equal amount of a 25 per cent. solution of this salt was injected. Four hours after this injection, all four extremities had become very much relaxed, and from this time on the patient steadily improved. A case of recovery from tetanus following the use of magnesium sulphate was reported in the *CIRCULAR* for July, 1910, page 359, the drug in this latter case being administered subcutaneously.

Liability of Cities for Water Pollution.

Following an epidemic of typhoid fever at Mankato, Minn., which the State board of health determined to be due to the pollution of the city water supply by sewage, the widows of two men who died of the disease brought suits for damages against the city on the ground that their death was due to the negligence of city officials. The city demurred, and this demurrer was appealed to the supreme court, which has decided that such suits can be maintained against a city and that the city is liable; if damages can be proven.

Determination of Minute Quantities of Calcium in Presence of Much Magnesium.

Liesse (*Ann. chim. anal.* through *Pharm. Journ.*) proposes a method of determining minute quantities of calcium in the presence of much magnesium, which consists in precipitating the calcium as oxalate in solutions so dilute as to keep the magnesium oxalate dissolved. From 1 to 2 grammes of the substance is treated with 20 to 25 c.c. (mils) of hydrochloric acid, then diluted to 100 or 200 c.c. (mils) with water, and made just alkaline to phenolphthalein with ammonia. Insoluble matter is then removed by filtration; the filtrate is diluted to 1,500 c.c. (mils) for each gramme of substance taken, this dilution being made in the cold. Four grammes of ammonium oxalate crystals are then added, and sufficient acetic acid to give an acid reaction. After standing two hours, with occasional agitation, the liquid is filtered and the precipitate is washed with three portions of 150 c.c. (mils) each of hot water. The precipitate is then gently ignited, and weighed as calcium carbonate. Although the volume of liquid required to be filtered is considerable, filtration is very rapid.

Estimation of Arsenic, Antimony and Tin.

By allowing potassium ferricyanide to act on arsenic trioxide, antimony trioxide and stannous oxide in the presence of potassium hydroxide, these substances are oxidized to arsenic pentoxide, antimony pentoxide and stannic oxide with the reduction of the ferricyanide to ferrocyanide, according to the following equations:

Palmer (*Zeit. analyt. Chem.* through *Rép. de pharm.*) has based on these reactions a process of estimating arsenic, antimony and tin by titrating the ferrocyanide formed with potassium permanganate solution, according to the following equation:

Danger of Wire Nets in Surgery.

Riem. (*Arch. klin. Chir.* through *Bost. Med. and Surg. Journ.*) reports observations as to the final condition of nets woven of silver wire after having been sutured into the abdominal wall to close a hernial gap, that convince him that their use is not only foolish, but dangerous. The silver becomes eroded, the net loses its shape and may possibly wander through the tissues until its loose ends of wire puncture an artery.

Risk of Tetanus from Kaolin Paste.

It is reported in *Therapeutic Medicine* that several cases of tetanus have occurred in Germany which were apparently caused by a kaolin paste dressing. This suggests the risk always present in such a preparation, as sterilization is very difficult and may be imperfect.

Separation of Aluminum from Iron.

Barbier (*Bull. soc. chim.*) has employed sodium hydrosulphite ($\text{Na}_2\text{S}_2\text{O}_4$) with advantage for the separation of aluminum from iron. The solution containing the metals is mixed with a slight excess of sodium acetate and then carefully with a 10 per cent. solution of sodium hydrosulphite until the reddish color produced by the sodium acetate has disappeared. By boiling the mixture the aluminum is precipitated in a dense condition and can easily be filtered out, while the iron remains in solution in the ferrous state. If the mixture contains beryllium in addition to aluminum and iron, the former is precipitated with the aluminum, from which it can be separated by treating the well-washed precipitate with a concentrated solution of ammonium carbonate, allowing the mixture to stand for 36 hours, separating the aluminum by filtration and precipitating the beryllium from the filtrate by boiling.

True Arbutin.

According to Hérissay (*Pharm. Post.*) true arbutin gives glucose and hydroquinone on hydrolysis with emulsin. Commercial arbutin, by which name extract of uva ursi is marketed, is a mixture of true arbutin and methyl-arbutin, the latter giving on hydrolysis, methyl-quinone. Attempts to separate arbutin and methyl-arbutin by fractional crystallization were of no avail. The author succeeded in isolating the former by dissolving commercial arbutin in alcohol, precipitating with caustic potash, dissolving the precipitate in acetic acid and reprecipitating the solution with potassium carbonate. From the potassium salt of true arbutin, thus obtained, the latter can easily be isolated. It crystallizes with one molecule of water, turns polarized light $63^\circ 5'$ to the left and seems to be identical with the glucoside previously isolated from pear leaves by Bourquelot and Fichtenholz.

Soja Beans for Diabetics.

By prescribing for diabetics food containing a comparatively large amount of fats (walnuts, hazel-nuts, pea-nuts, etc.,) the amount of glucose in the urine can be considerably diminished. Le Goff (*Gazette des Hopit.* through *Rép. de pharm.*) has found that the same gratifying results can be obtained by putting the patients on a soja bean diet. Soja beans are rich in fatty substances (20 per cent.) and proteins (41 per cent.) but poor in starch and other carbohydrates (14 per cent.) and consequently are very suitable as diet for diabetics. The author also reports having succeeded in raising the beans in France.

Poisoning by Heroine.

Trawick (*Kentucky Med. Journ.*) reports a case of severe poisoning following the injection of $\frac{1}{2}$ grain of heroine, a short time after an operation for chronic appendicitis. The symptoms appeared within ten minutes. The patient had the appearance of a person profoundly under the influence of an opiate. After about an hour of medical and mechanical stimulation and manipulation, the respiration count was about ten to the minute, but during that hour it had been very irregular, going from four to eight a minute, and back to four. The pupils were contracted to pinpoints during this time. The patient recovered.

The Modern Materia Medica.

Adipol is a mineral-fat preparation, capable of absorbing up to 30 per cent. of water.

Amidoazotoluene Dusting Powder is said to consist of amidoazotoluene, zinc peroxide, and bismuth subnitrate.

Amigrin has been said to be "magnesium acetyloxybenzoate." According to Zernik it seems to be a mixture of calcined magnesia and acetylsalicylic acid.

Casona Cheese is a soft cheese, combined with agar-agar. It is offered as a preventive of constipation.

Cement Paste, Dr. Dreuw, is said to consist of sulphur, ichthyol, and Lassar's paste.

Cinnamic Acid Allylester occurs as a yellowish liquid possessing an aromatic odor. It is put forward for the treatment of tuberculous ulcers.

Citrospirinum, exploited for the treatment of influenza, headache, rheumatic pain, etc., possesses the properties of acetylsalicylic acid and citrated caffeine.

Cremor sico is the name for drying creams containing salicylic acid, borax, lysoform, etc.

Cytone contains creosote, terpene and indifferent oils.

Danzol is, according to recent investigations, a methyl alcoholic extract of arnica and contains formic acid (which may yield additional methyl "alcohol by splitting up" in the system). The danger of the use of methyl alcohol even for external application is well known. Blindness has been produced from exposure to the vapor.

Dermaseife (soap) is a mild sulphur soap.

E Fue Sa are tablets for the treatment of obesity; they are said to contain an extract of bladder-wrack.

Eklekt is the name for a nutritive preparation made from milk and malt.

Enterorose, exploited for the treatment of disturbed digestion in children, is a mixture of wheat and oat starch partially converted into dextrin by the action of diastase.

Eumictol is a solution of zymargol, an organic silver compound.

Funk's Creosotaller III, Comp. is said to contain creosotal, sodium cinnamate and benzoate, menthol, albuminoids and flavoring agents. It is marketed in the form of pearls.

Gastrozymase is the natural gastric juice of the pig, obtained by a special process and dried. It is intended for use in gastric affections.

Globularin is a glucoside isolated from globularia alypum. It is put forward for treating diabetics whose urine does not contain acetone, acetic acid or other ketones.

Hercynia is the name for a stimulant which is said to contain the water-soluble extractive matter of *agaricus campestris*.

Hémoneurol granulé Cognet is said to contain oxyhemaglobin, kola extract, calcium glycerophosphate, and sugar.

Hormonadin is a preparation derived from the pancreas.

Hydropyrin Grifa is lithium acetylsalicylate. It occurs as a white crystalline powder, which is water-soluble and almost odorless.

Hydroxycodine is a new opium alkaloid. It is a tertiary base with the formula $C_{18}H_{21}O_4N$; it melts at 51° and forms a hydrobromide, which crystallizes in large prisms. It is slowly soluble in water and the organic solvents.

Iubol is the name for tablets recommended as a laxative. They are said to contain agar-agar, and extracts of bile and pancreas.

Katalbad is the name of a preparation for making oxygen baths.

Kacepe Balsam is said to consist of acetylsalicylic acid mentholester, acetylsalicylic acid ethylester and lanolin ointment. It is exploited as an application in rheumatism.

Lethargin is a witchhazel extract containing novocaine.

Lipochol Emulsion and Pilules contain cholesterol.

Locosemin, recommended as an anesthetic, seems to be almost identical with *eusemin*.

Mellonal is the name for an extract of various drugs, amongst others myrtle leaves, uva ursi, zygii jambolani, and linseed.

Neoborat is another name for sodium perborate.

Neue Novichtankopfwaschseife is the name for a soap, said to contain "novichtan," a substance described as being obtained from bituminous coal oil.

Novocol-Chinin is quinine monoguaiacol phosphate.

Nucléatol Robin consists of sodium nucleophosphate.

Nutromul is a cotton seed oil emulsion containing calcium, sodium and magnesium hypophosphites.

Oculenta is the name of ointments used for the treatment of eye diseases.

Oxydol is a perhydrol mouth water.

Paracreolin is the name for a disinfectant, nearly related to creolin Pearson.

Plasma von Quinton is sterilized sea-water, diluted with sufficient distilled water to obtain a mixture which is isotonic with the human blood-plasma. It is used hypodermically.

Poeschol, recommended for the treatment of rhinitis, is said to contain boric acid, solveol, salol, menthol and camphor.

Proiodin seems to be identical with lactoide. It is a combination of iodine with lactalbumin.

Scharff's Solution is said to contain morphine, atropine sulphate, and antipyrine.

Sulfoform is another name for triphenylstilbin-sulphide.

Thymorybolum is the name of a syrup of potassium sulphoguaiacolate.

Thyratoxine de Byla is a thyreoidin preparation.

Ureochinin is quinine hydrochlorocarbamide.

Vanodrin, a dental anesthetic, is said to contain novocaine, and adrenalin hydrochloride.

Application for Perspiring Feet.

Dried alum.....	50 grammes.
Salicylic acid.....	5 grammes.
Tannin	15 grammes.
Powdered talc.....	430 grammes.

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Determining the Alcoholic Content of Tinctures.—C. I., Michigan.—As tinctures usually are preparations with known formulas, we presume that you do not wish to know how analysts determine the proportion of alcohol in a liquid by chemical means, but rather how the quantity of the spirit in a tincture is ascertained by computation. This is done by a very simple mathematical calculation, plus the exercise of some judgment as to the amount of space occupied in the tincture by matter extracted from the crude drug—that is, in cases in which such extractive is present; and in other cases, the corresponding factor must be considered.

For instance: Tincture of calumba is made by exhausting the drug with a menstruum composed of 600 c.c. (mils) of alcohol (U. S. P.) and 400 c.c. (mils) of water. As the bulk of the extracted matter in this case is not great, it is easy to see that the finished 1000 c.c. (mils) of tincture contains nearly 600 c.c. (mils) of official alcohol, equivalent to 95 per cent. of 600 c.c. (mils), or 570 c.c. (mils) of absolute alcohol. Owing to the ease with which percentage calculations are made when one is working with the metric system, a glance suffices to show that 570 in a thousand is the same as 57 in a hundred, or 57 per cent. by volume.

In the case of tincture of ferric chloride the amount of space occupied by the ingredient other than the menstruum is sufficiently large to be taken into consideration. Official alcohol, undiluted, is used in making this tincture, but the solution of ferric chloride is 35 per cent. of the bulk of the finished product, leaving 65 per cent. for the alcohol; and 65 per cent. of official per cent. alcohol is about $61\frac{3}{4}$ per cent. of absolute alcohol.

Then take ammoniated tincture of guaiac as an example involving a somewhat different kind of calculation. Here not only does the drug occupy an amount of space that has to be allowed for, but the percentage of official alcohol in the menstruum, aromatic spirit of ammonia, is not self-evident. Reference to the formula for the menstruum shows that it contains 70 per cent. of official alcohol, equal to $66\frac{1}{2}$ per cent. of absolute alcohol; and somewhat less than this percentage is in the finished tincture, just how much less depending upon the amount of space occupied by the guaiac, which is not great enough to change this figure to any large extent.

Tincture of ipecac and opium is made by mixing three ingredients in all of which alcohol is present. In fluidextract of ipecac, of which 100 c.c. (mils) is used to the 1000 c.c. (mils) of finished tincture the percentage of absolute alcohol is about 71; and in diluted alcohol, of which about 100 c.c. (mils) is used, it is about 49. In the partially evaporated tincture of deodorized opium the alcoholic percentage is very small, as it was not large at first, and the alcohol is probably the first thing to go off in the evaporation process; and this tincture of deodorized opium consti-

tutes a large portion of the bulk of the finished tincture. Allowing 800 c.c. (mils) for the partially evaporated tincture of deodorized opium, with no alcohol; 100 c.c. (mils) for the fluidextract of ipecac, with 71 per cent. of absolute alcohol; and 100 c.c. (mils) for the diluted alcohol, with 49 per cent. of absolute alcohol, we proceed, by alligation, as follows—

Percentage.	c.c. (mils).	
0	800	= 000
71	100	= 7100
49	100	= 4900
	1000	) 12000 (12
		1000
		2000
		2000

—the quotient, 12, representing the percentage of alcohol. This is a rather rough calculation. Others have calculated the percentage of alcohol in this tincture and arrived at the same result that we have, while still others have published results ranging as high as 20 per cent.; and one even got as high as 45 per cent., but how, perhaps even he himself could not explain.

An article by Prof. Wilbur L. Scoville, on the estimation of alcohol in galenical preparations by laboratory means, was published in the CIRCULAR for January, 1908, page 6, and a further note on the subject of such estimations, with a correction of a typographical error in the first-mentioned, appears in the issue for the following month, page 71.

Elixir of Chromium Sulphate.—"Inquisitive," Pennsylvania.—There are four chromium sulphates varying considerably in color and solubility. The one physically best adapted to the making of a stable solution in hydro-alcoholic solvent in the chromous variety ($\text{CrSO}_4 \cdot 7\text{H}_2\text{O}$). This is a blue crystalline salt. We believe, however, that the chromic salt is the one used in medicine. This salt occurs as dark-green scales, as a green powder, as red crystals, and as violet crystals, depending upon the amount of water it contains. The scale salt is readily soluble in water, and its solutions will withstand the addition of alcohol.

Try the following formula:

Chromic sulphate (green scales)	33 grammes.
Distilled water.....	550 c.c. (mils).
Glycerin	250 c.c. (mils).
Alcohol	200 c.c. (mils).
Oil of orange.....	2 c.c. (mils).
Oil of pimento.....	1 c.c. (mil).
Paper pulp.....	enough.

Dissolve the chromium sulphate in a minimum quantity of the distilled water. Dissolve the oils in the alcohol; add the glycerin to the alcoholic solution, and shake with some shredded paper pulp. Add the remainder of the water to this mixture; shake again, and filter. Mix the filtrate with the solution of the chromium salt.

Headache Cologne.—G. L. B., New Jersey.—Generally speaking, headache colognes are simply weak cologne waters in which menthol or menthol and camphor have been dissolved. We are not able to say just what proportions any certain manufacturer uses, but a little experimentation should enable you to hit upon something satisfactory.

Parts in a Thousand on a Percentage Basis.—R. E. A., Ohio, whose query concerning the quantity of a 1-in-1000 solution it is necessary to use to make 1 ounce of a 1-in-10,000 solution was answered in the CIRCULAR for February, page 80, writes that he wants the answer worked out on a "percentage basis." Just why he should desire to complicate the question by introducing percentage, we are unable to see; one can not measure "percentage" in a graduate, but having ascertained mathematically what the bulk of a certain percentage of a liquid is, he can then measure that bulk in a graduate.

Our way of going about the diluting of a stock solution to make a solution of less strength, is thus stated in the February issue:

In diluting a 1-in-1000 solution of a salt to make a 1-in-10,000 solution, it is evident that 1000 parts of the stock solution (containing 1 part of the salt) added to 9000 parts of water, will make 10,000 parts of the diluted solution containing 1 part of the salt, or, 1 part to 9, to make 10. The prescription called for 1 ounce of the diluted solution. If 1 ounce is 10 parts, then 1 part is $1/10$ of 1 ounce and 9 parts is $9/10$ of 1 ounce. An ounce being 480 minims, $1/10$ of 1 ounce is 48 minims, and $9/10$ of 1 ounce is 432 minims. By adding 48 to 432 we get 480, by way of proof of the correctness of the work.

Percentage is always based upon parts in 100. In the case before us, instead of saying 1000 parts and 9000 parts make 10,000 parts, we might say 10 per cent. and 90 per cent. make 100 per cent. Then, 100 per cent. being 480 minims, 10 per cent. would be 48 minims and 90 per cent. would be 432 minims.

In order to arrive at the correct percentages in all cases, as in many it is not so apparent as in the one before us, we divided the number of parts of the finished solution to contain 1 part of the solid (in this case, 10,000) by the number of parts of the stock solution containing 1 part of the solid (1,000); then divide 100 (the basis for all percentage work) by the quotient (10), when the new quotient (10) will be the percentage of the stock solution to be used in making the diluted solution. The amount of the latter to be made, whether $\frac{1}{2}$ ounce, 1 ounce, 50 ounces or a barrelful, is always 100 per cent. In the case before us it is 1 ounce, or 480 minims, so we find, as before that 480 minims being 100 per cent., 10 per cent. is 48 minims, and the other 90 per cent. is 432 minims.

As it is necessary to reduce the percentages or parts to specific terms, as minims, or ounces, or gallons, before we can measure them, no matter how we calculate, it seems to us that the process given in our February issue is as simple as any.

Preventing Perspiration.—F. W. W., Missouri.—While there are a number of drugs which when taken internally have a tendency to diminish perspiration, we think it best for pharmacists to leave the prescribing of them to physicians. Local applications of tanning substances, as tannic acid, formaldehyde, etc., also retard perspiration, but we feel that when it comes to a matter of interrupting a natural function of a human organ, those who are not familiar with the importance of that function and the seriousness of the consequences of its partial cessation, should keep hands off. If they must make experiments in the realms of some higher science about which they are lacking in knowledge, let them predict eclipses, read the story of the changes which have taken place

in this old earth as written on the rocks, or do some other such stunt which will result in no injury to a fellow mortal. They might even experiment on a fine gold watch that needed attention, for if they ruined it another could be bought for a hundred dollars; but when a human organism is damaged, the injury is often irreparable.

It may be considered within the province of a pharmacist to supply something to overcome the disagreeable odor of perspiration, and for this purpose he may sell a powder consisting principally of sodium bicarbonate, with a little starch or talc, boric acid, and perfume added.

Pharmacy in South America.—J. S. S., Pennsylvania.—Joseph Jacobs, of Atlanta, Ga., was elected chairman of the section on commercial interests of the American Pharmaceutical Association in 1897, and with characteristic energy he at once started something. As a result, there was issued from the bureau of foreign commerce at Washington, a book entitled *The Drug Trade in Foreign Countries*, made up principally of reports from United States consuls. This book is volume XIV of the special consular reports, and was printed in 1898. Doubtless it may be obtained from the superintendent of documents at Washington, either direct or through the intervention of a member of congress.

In this volume is given much general and specific information about the practice of pharmacy and the sale of drugs in the various countries of the earth. As this information may not be up to date in many instances, it might be well for anyone wishing to migrate to South America (or any other foreign quarter of the globe, as to that) to write to the United States consul in the city in which the inquirer thinks of locating, and ask for later information as well as for elucidation of any points on which the seeker for information desires more light. It would not be a bad plan for the inquirer to enclose a letter addressed to some American druggist doing business in the city, requesting data from one who really has them—one who can speak *ex cathedra*.

Formaldehyde Cones.—F. F. Z., New Jersey.—Cones or pastilles from which formaldehyde is liberated upon ignition, have paraformaldehyde as their base. This may be formed into pastilles by massing it with charcoal and saltpeter, about 10 or 12 parts of charcoal to 1 of saltpeter, using mucilage of tragacanth as the binding material. The cones are weak in formaldehyde and inferior in disinfecting power to the lamp outfits.

While some authorities seem to regard lightly the statement that formaldehyde is a dangerous poison and that its vapors may cause serious eye trouble if not even actual loss of sight, in view of the warning given in the United States Dispensatory it behooves druggists to be careful in their handling of this drug and to protect their customers by oral and printed caution concerning its nature. The statement in the United States Dispensatory is: "Upon the higher animals its [formaldehyde's] action is comparatively feeble, excepting as a violent irritant, producing when inhaled, even in an extremely diluted form, severe bronchitis or even pneumonia, and when taken internally a severe or fatal gastritis."

What Is an Ounce?—N. C. C., Minneapolis, in excusable bewilderment, writes as follows regarding a formula which appears in a recent number of the CIRCULAR:

We would like to know if the pounds and ounces mentioned are troy or avoirdupois, and whether the glycerin is given as liquid ounces or ounces by weight. Speaking generally, are the formulas in the CIRCULAR based upon troy ounces or avoirdupois, and where glycerin is mentioned is it by weight or liquid measure?

As the formula in question was a contributed one, we find ourselves unable to answer the first part of the question categorically, but our understanding is that when weights are mentioned without qualification, except in prescription work, avoirdupois weights are meant, and that the practice of American druggists is to weigh solids and measure liquids.

If it were possible to show to those who still blindly stick to it the absurdity of the old-style system (or lack of it) of weights and measures, the mere publication of this inquiry would be sufficient to do this. No one who is not so thick-headed that he can not see, or so stubborn that he will not look, can fail to be impressed by the statement of the feeling of uncertainty in which our correspondent finds himself. An ounce of glycerin may be—

an avoirdupois ounce, or 437.5 grains,
a troy ounce, or 480.0 grains, or
a fluid ounce, or (about) 566.5 grains.

In Canada there is the imperial ounce, which is different from any of the three just mentioned, and in other countries there are other ounces not so well-known on this side of the water.

Recognizing the advantages of the decimal system of weights and measures, scientific men the world over employ them, and in Continental Europe these standards are used largely in trade—especially the drug trade. In this country the metric system is the legally authorized one, and is in use exclusively in many of the departments of the United States government. So far as we know, no country or individual has ever gone back to the old-style weights and measures after having used the decimal system, and is no more likely to do so than we are to abandon our convenient dollars and cents and return to the cumbrous British pounds, shillings and pence. Opposition to the metric system comes from those who do not use it, but who, when compelled to work with quantities expressed in it, employ the old-style weights and measures and a table of equivalents. If required to do this, even the metric enthusiasts would doubtless vote to return to the old-style.

Eckman's Alterative.—G. N. T., New Jersey.—This is one of a great many preparations offered as a remedy for tuberculosis. Giving the patient plenty of pure air and nourishing food is now considered the proper treatment of weakening lung affections, and those who offer something in a bottle as a remedy may well be regarded with suspicion—not to use a stronger word. Honest and intelligent people among physicians, pharmacists and the general public are standing together to point out to the long-deluded public the ignorance or dishonesty of those who claim to be able to cure consumption with drugs.

In its issue for October, 1909, the *Sanitary Bulletin*, published by the New Hampshire Board of Health, contains a number of notes on proprietary

remedies, which were reprinted in the CIRCULAR for April, 1910, page 195. Concerning Eckman's alterative this *Bulletin* said:

We read that this preparation was perfected by a veterinary surgeon, who first demonstrated its curative (?) properties upon cattle and later upon a member of his family. The present proprietors of this alleged remedy issue a booklet abounding in claims to the effect that the preparation is a cure for consumption. "We do not claim to cure tuberculosis in the last stage, although we have such cases of record." The analysis shows 6.80 per cent. of total solids on evaporation, consisting mainly of calcium chloride, the quantity of this salt found, calculated to the anhydrous condition, amounting to 3.59 per cent. Some suspended matter noted consisted of powdered clove. The preparation is held as misbranded.

Pharmacists would do well to let the public understand that pharmacy has nothing in common with the manufacturing of such preparations. That we are not giving our readers advice which we are unwilling to take ourselves, is shown by the fact that we have excluded the advertisement of this article from the pages of the CIRCULAR.

Liquid Peptonized Foods.—T. D. S., Pennsylvania.—Something more than simply a formula is necessary for the preparation of a liquid containing peptonized or almost-peptonized proteids of meat, milk and wheat, because the making of peptones and peptonates is a formidable task even for the trained manufacturing chemists. Two gentlemen of this profession, Messrs. Scoville and Howard, covered well the various phases of the subject in a comprehensive article in the CIRCULAR for December, 1898, pages 287 and 288. In the issue for April, 1907, page 307, appears a reply to a querist of which the following is the principal part:

So far as we know, a palatable preparation of peptones has not yet been made. A careful scrutiny of the labels of some "peptonoids," and similar preparations, discloses the fact that these are not offered as preparations of peptone, but are said to be "digested" products, or to "contain peptones," from beef, wheat and milk. Analyses of such preparations in Dr. Allen's laboratory showed that these liquid "peptonoid" preparations contained respectively 0.43 per cent., 0.48 per cent. and 0.52 per cent. of peptone with traces of albumoses and meat-bases. A "peptonoid" in powder form yielded 0.88 per cent. of peptone in a total of 16.27 per cent. of proteids of which 12.22 per cent. were insoluble proteids, and 3.17 per cent. were albumoses. The powder contained 23.64 per cent. of starch and 48.52 per cent. of milk sugar. The amount of peptone in any of these preparations is too small to be of much medicinal value.

The trouble is that when digestion is carried out to completion, bitter substances are formed that are very unpalatable, and no means of overcoming this objection have yet been devised. So the apparent aim of such preparations is to exhibit a form of soluble proteids which have been digested as far as is practicable, but in which only a trace of peptone is formed, and which is free from bitterness. If, for instance, milk be treated with pancreatin and sodium bicarbonate at a temperature of 38° C. for five minutes, the casein will be partially converted so that it will not coagulate in clots, but will show little change in taste and appearance. If the milk be treated in an open vessel, this change can be watched. The milk first forms a thin pellicle, then becomes gradually but softly curdled. The curd then gradually redissolves and the milk recovers its original appearance, until the peptone is formed, when the milk loses its whiteness and assumes a dull yellowish-gray shade. It then has a bitter taste. This last stage must, therefore, be avoided and yet approached as closely as possible.

For making beef peptones there are two methods. One, and probably the best one for ordinary purposes, is to treat the beef with superheated steam. This does not form true peptone, but makes "pseudo-peptones," which are soluble and somewhat more easily digested. The other

method consists of treating the meat with pepsin and 2 per cent. hydrochloric acid for six hours, or until a slight bitterness appears, at a temperature of 52° C. with constant stirring. This changes the albumin to albumose, and forms a very small proportion of peptone.

The manufacturers of a proprietary liquid "peptonoid" preparation state (Standard Formulary) that their product contains

Proteids (peptones and propeptones)	5.25 per cent.
Lactose and dextrose.....	11.30 per cent.
Cane sugar.....	2.50 per cent.
Mineral constituents (ash)....	0.95 per cent.
Alcohol, by volume.....	17.50 per cent.

A large proportion of alcohol is required in proteid preparations as a preservative.

Perhaps the appended formulas for simple peptonized foods may afford a base for experimentation toward the desired end:

Peptonized Beef Tea.

Pancreatin	10 grains.
Sodium bicarbonate.....	30 grains.
Lean beef.....	8 ounces.
Water	20 ounces.

Mince the beef and let it simmer with the water in a covered vessel for ninety minutes. Allow the product to cool to 140° F., and add the pancreatin and the sodium bicarbonate previously mixed. Keep the mixture in a warm place (about 100° F.) for a sufficient length of time, shaking occasionally; strain, and boil.

Peptonized Toast Gruel.

Toast crumbs.....	enough.
Water	enough.
Pancreatin	5 grains.
Sodium bicarbonate.....	15 grains.

Boil a sufficient quantity of well-dried toast crumbs (no crust or burned particles) with enough water to make 1 pint of thick gruel after it has been well cooked. Mix with this gruel the pancreatin and the sodium bicarbonate, and set the mixture aside in a jug in a warm place for a sufficient length of time. Then bring the gruel to a boil, let it boil a few minutes, and strain it.

Peptonized Milk.

Fresh milk.....	20 ounces.
Water	5 ounces.
Pancreatin	5 grains.
Sodium bicarbonate.....	15 grains.

Dilute the milk with the water; add the other ingredients; place the container in a water-bath, and keep at a temperature of 110° F. for a sufficient length of time, shaking occasionally. Raise the temperature rapidly until the liquid boils; and allow the product to cool.

In all these processes care must be taken to stop the digestion before the extremely bitter peptones are formed. About two hours is required for complete peptonization, but if the heat is continued for this length of time, the preparation will doubtless be far from palatable.

Gray Powder.—L. G. P., Florida.—This is a synonym for mercury with chalk, as may be seen by an examination of the index of the Pharmacopœia, or the text of any of the commonly used books on pharmacy.

Which Calamine.—A. J. P., New York, wants to know whether, in filling a prescription for "lotio calaminaris," he should use lapis calaminaris or the prepared calamine. He has had a dispute with the prescriber and wants us to settle it.

One of the store maxims of the late Marshall Field, who was, perhaps, the most successful merchant of his time, was, "The customer is always right"; and a good maxim for druggists would be, The physician is always right—or, at least, *nearly* always. If the prescriber of "lotio calaminaris" desires the crude drug used in making the lotion, he is right when he says that that is what he wants; if he wants the prepared drug used, then he is right when he says so. Our present querist does not intimate which one the doctor said he wanted, and so we are left to treat the matter as an abstract principle.

The United States Dispensatory says that "calamine must be impalpable before being used as medicine"—meaning, we take it, that the prepared calamine is the one to be so used, although, of course, the crude could be made impalpable; too. Most of the older books specify the prepared article as the one for use in pharmacy. In the British Pharmaceutical Codex, the only official or quasi-official book of standards in which we find a formula for this lotion, the use of the prepared calamine is directed. In Squire's Pharmacopœias of the London Hospitals, eighth edition, out of twelve formulas for this preparation, four specify "prepared calamine"; five just "calamine"; two "levigated calamine," and one, "native calamine." It has been our experience that physicians generally prefer the prepared article as it is less liable to be gritty than is the native calamine.

If the druggist has inadvertently used the kind that the physician did not wish, he should explain to the latter why he did so, and assure him that it is his desire to supply what is wanted, and that he will always do so when he knows what that is.

Face Enamel.—G. H. G., Pennsylvania.—No one but a trained physician who had specialized in dermatological practice would be able to overcome the condition to which you refer. To do this would require long and careful systemic treatment, general and local. The disguising enamels are usually paints made with a base of bismuth subnitrate or lead carbonate, both of which are well suited to produce and do produce and aggravate the eruptions they are expected to conceal, and both of which are absorbed through the skin to act as cumulative poisons to the general system.

Dermatology is no part of pharmacy. Its practice should be left, on the one hand, to the physician who knows what he is about, and on the other to the "beauty specialist" whose only interest is in the plumpness of her purse.

Orange Manna.—S. W., Colorado.—How this "king of medicines," which is (on the label) "a pure food product containing no drugs of any kind," is made is a secret in the keeping of which we do not share. We opine, however, that its physical and real therapeutical characteristics would be closely simulated by a mixture of bran and glucose flavored with extract of orange and perhaps colored with a little caramel.

One-Solution Black Hair Dye.—W. C. K., Wisconsin, wants to know how to prepare a one-solution black hair dye without the use of salts of silver or lead. There are lots of one-solution black hair dyes containing silver or lead salts, and lots of two-solution black hair dyes that do not contain these salts, but our querist puts such restrictions on us that the number of formulas from which to make a suitable selection is reduced to rather small proportions. He might experiment with this one:

Iron sulphate.....	2 drams.
Glycerin	1 ounce.
Cologne water.....	1 ounce.
Rose water.....	14 ounces.

A solution composed of these ingredients, will, according to the Standard Formulary, if applied to the hair twice daily, gradually darken it.

There are formulas for hair dyes containing synthetic colors, including paraphenylenediamine; any of them may prove injurious to the scalp; the dye named is notably dangerous as it frequently produces serious eruption. It has been found in two proprietary articles which caused trouble, namely, Mrs. Potter's "walnut juice hair stain," and "eau sublime." See the CIRCULAR for December, 1910, page 625. It may be said that, as a rule, all hair dyes injure the hair and skin.

Mentholatum.—C. V. D., District of Columbia.—A few years ago, in reply to a request similar to yours, we said: "We have never analyzed this preparation and do not know what its constituents are, but so long as we are able to procure white petrolatum and menthol and rub them together our ignorance concerning the proprietary article gives us no concern whatever." Later we added that if a stiffer ointment is wanted than results from this mixture, a little paraffin might be incorporated.

Seeing the notes mentioned, a reader of the CIRCULAR sent us a formula for a preparation of this nature, which follows:

Camphor	20 grains.
Menthol	30 grains.
Thymol	10 grains.
Boric acid.....	15 grains.
White wax.....	2 drams.
White petrolatum.....	enough to make 8 drams.

Platt's Chlorides and Vermin Killers.—M. B. S., Virginia.—Reports of some analyses of Platt's chlorides appear in the CIRCULAR for August, 1910, page 422, together with a bit of information as to the low rank as disinfectants of the chemicals which are said to be its principal ingredients. While it can not be said that even low-power disinfectants do actual harm, their use may result in evil by establishing a sense of false security.

Just why a vermicide should be used in conjunction with this or any other preparation of chlorides—that is, mixed with it—we do not see. Formulas for good vermicides abound in the CIRCULAR, several having appeared in the issues for this year. We do not know that the preparation made according to any of these formulas would be improved by the addition of a solution of chlorides, and we strongly suspect that quite the contrary would be the case.

Prescription Record.—G. S. M., New York, requests a "suggestion for a convenient and economical prescription record, especially adapted to a large prescription business." By "record" we assume that our querist means a filing system, as the prescriptions, properly tagged and filed, constitute the best and only complete record of themselves, although we have heard of records kept by druggists to show the number of prescriptions received by them from each physician during the month, and the amount received for filling the same. Such a record may be kept in a book properly ruled, the entries being made somewhat in this manner:

	Dr. Jones.	Dr. Smith.	Dr. Brown.	Total.
Jan.	75 \$40.50	106 \$52.75	41 \$25.00	222 \$118.25
Feb.				
Mar.				
etc.				
Total				

Then there is such a thing as a daily card index showing the number of the prescriptions, the name and address of the patient, the name of the doctor, the price, the shape in which the medicine was dispensed (pills, liquids, etc.), and any additional data which the druggist may wish.

Such records, however, are independent of and do not take the place of prescription files. We believe the old-fashioned way of pasting the prescriptions in large books made for that purpose is still in vogue in the majority of stores, but improvements on this method, as well as entirely new plans, have been proposed from time to time and adopted by many.

Card index systems very readily lend themselves to the filing of prescriptions, or for keeping a record of prescriptions filled. Some druggists find very convenient the use of cards somewhat larger than the usual prescription blank, to which they paste the prescription when it is filled, and on the extra space record the name and addresses of the patient, the name of the doctor, the price, the manner of filling, and, of course, the date and number of the prescription. These cards are filed in the usual filing cabinets, with index cards for every one hundred, or for every week or month, and, when the cabinet drawers are full, are transferred to boxes and stored away on shelves. A detailed description of such a system appears in the CIRCULAR for October, 1906, page 352.

A variation of this system consists of pasting the prescription on ledger paper, punching holes in the paper with the ordinary bill-file puncher, and fastening the sheets together by means of McGill's fasteners. These fasteners are the kind that consist of a narrow strip of brass so bent in the middle as to form a head, while the ends of the strip may be bent to hold the papers filed. The leaves may be made large enough to hold two or four prescriptions, and the latter should be pasted on these leaves, and filed, at the end of each day's work. To mark each hundredth prescription an index leaf of a different color may be used. For backs to "books" so made, cloth-covered card-board is suitable, the cloth permitting the bending back of the covers without severing them. These books may be made as large as convenient, as the fasteners come in different lengths, and filed away in any convenient manner, duly labeled on the outside, of course. The latest book in daily use should be kept to small dimensions, while the permanent files may be made larger.

Here is another plan: Buy at a hardware store a

few dozen screw hooks bent at right angles. Screw a pair of them into a suitable piece of board at just the right distance apart to receive a prescription perforated by the ordinary bill-file perforator; and alongside of these screw another pair so that the ends of the two hooks of the first pair will just touch the ends of the two hooks of the last pair, forming a file which will permit the turning up to view of any prescription, or by a slight turn of two of the hooks, its removal from the file. When the file is full, it may be properly labeled and stored away in a suitable box.

A Home-Made Prescription File and Cabinet.

The illustration herewith was drawn by A. B. Burrows for the *Bulletin of Pharmacy*.

While it is often a great convenience to be able to remove a prescription from the file, it is anything else but convenient when one wishes to find the prescription again, to discover that it has not been returned to its proper place. So, some prefer books and others loose files.

To prevent the tearing of prescriptions, bits of tough paper or even of cloth or court plaster may be stuck to them at the places where the perforations are made.

We should welcome suggestions as to filing systems which may be considered improvements on the ones we have described.

Tooth Powder Formula.—S. A. C., New Jersey. —We do not know the formula for the tooth powder you name, but are not worrying about our ignorance, as after examining the powder we conclude that it is a rather commonplace one whose equal or superior is to be found among the "own-make" goods on the shelves of hundreds of drug stores.

Suppose you experiment a little on your own account, using as a basis—

Precipitated chalk.....	1 ounce.
Powdered soap.....	1 dram.
Thymol	5 grains.
Oil of gaultheria.....	2 drops.

In the course of your experiments you might introduce a little orris, starch or other ingredient.

"Misting" of Eyeglasses.—The Texas Drug Company, Illinois, referring to a note in the CIRCULAR for last month, page 140, writes that rubbing castile soap on eyeglasses, and polishing with a silk handkerchief will prevent the condensation of moisture on them.

For this note and for all other helps for use in this department or elsewhere we are truly grateful.

Preventing Fermentation.—S. W. H., California. —There are several factors which must be taken into consideration in determining the amount of a preservative that will be required to prevent the fermentation of "an aqueous, saccharine fluid, weak in sugar." First to be considered is the composition of the fluid. If a fluid contains yeast, gum, citric acid or fruit juice it is much more likely to ferment than is a simple solution of sugar in water. On the other hand, the presence of certain chemicals, spices, or aromatic oils will render the fluid less prone to fermentation.

The second factor to be considered is the degree of cleanliness attending the preparation of the fluid. In fact, cleanliness might well be placed first. If the water used has been sterilized, if the sugar is all sugar and clean, if the utensils are aseptic and the containers are in the same condition, if containers and contents are heated before closing to about 80° C. for half an hour, and if the packages are closed with stoppers free from micro-organisms, there will be little if any need for a preservative in the finished product.

However, if the composition of the preparation or some other factor makes the aforementioned conditions impossible, a general knowledge of the inhibitory or antiseptic strength of the preservatives less harmful to the human organism will stand the maker of "aqueous, saccharine fluids" in good stead. According to Flügge salicylic acid will prevent bacterial action when present to the extent of 1 part in 1500; except under conditions unusually conducive to the action of enzymes, ordinary saccharine fermentation may be prevented by a smaller proportion of the acid, and we know from experience that the acetic acid fermentation of apple cider is prevented by 1 part of the acid in about 3500 parts of cider. Flügge gives 1 to 1000 as the antiseptic strength of benzoic acid; this is the same as the much talked of one-tenth of one per cent. in which strength it is claimed sodium benzoate is effective as an antiferment. Alcohol is generally over-rated as a preservative. Its germicidal action is practically nil, and to exert even a mild antiseptic influence it must be present to the extent of at least 10 per cent. Glycerin is not a good antiseptic; in fact a small proportion of glycerin is favorable to the growth of some bacteria. When present to the extent of at least 25 per cent. glycerin hinders but does not stop putrefactive decomposition. The real value in glycerin lies in the fact that it does not ferment and is generally used to replace sugar syrup, which does.

A syrup preserved by the addition of antiseptics is not to be commended for use in food or drink, or in medicine.

A Good Bay Rum Formula.—Frank T. Gillespie, Michigan, feels enough gratitude to write the following note:

Your request in the February CIRCULAR, page 82, for six different druggists to try the formula of F. W. Scott, Jr., New York, for bay rum, and report results, will probably be answered by that many hundred, and if that number tries it, so much the better. The writer has made some bay rum according to that formula and found it excellent—just what he has been looking for. Success to Mr. Scott and the CIRCULAR!

On page 183 of this issue is an article on bay rum by F. T. Gordon, who, as a United States naval pharmacist, has seen a good deal of the work, including the island of St. Thomas.

Electrolytic Rectifier.—L. G. Smith, North Carolina, writes:

In reply to the appeal to readers for information for "M. S., Illinois," relative to a rectifier for changing alternating current to direct, I advise you that much information on the subject may be had by consulting the following electrical magazines: *Popular Electricity* for August, 1909, page 235, and for February, 1910, page 678; and *Electrician and Mechanic* for January, 1911, page 7.

This information is given with the assumption that a rectifier of the chemical, or electrolytic, type is wanted. By reference to the publications above referred to, this type of rectifier may be easily made at home at a cost of about \$3.

The mercury arc rectifier is much more efficient than the chemical, but the original cost is many times greater; this type may be purchased in the market.

Current after being rectified is reduced about 30 in voltage and is of a pulsating character; this reduction is on a basis of 110-volt supply.

The article first cited by Mr. Smith was by H. L. Transtrom, who directed the following procedure:

Procure four glass jars; those used for ordinary wet-cell batteries are well adapted for this purpose, although any glass, rubber or porcelain jar will do. Cut four disks of dry birch wood to fit loosely in the tops of the jars, and four more disks 4 inches in diameter by $\frac{1}{2}$ inch thick. Screw the latter fast to the smaller disks to form covers for the jars.

Cut a 1-inch lead pipe into four 6-inch lengths and cut out of each with a hacksaw enough to permit bending one end together in such a manner that a long machine screw can be passed through it to a binding post on top of the cover.

Cut four rectangles of soft aluminum 5 by 6 inches by $\frac{1}{8}$ inch thick, with a projection $\frac{3}{4}$ inch long and $\frac{1}{2}$ inch wide on one of the longer sides; this is to be bent over at right angles. Screw these plates fast to the $\frac{1}{2}$ inch disk, concentrically with the lead pipe, and countersink the projection into the wood so that it is flush with the under side of the cover disk. Bore a hole through the projection and the disk and fasten a machine screw through it to the binding post.

Figure 1.
Section of Completed
Cell.

Figure 2.
Manner of Connecting
Cells for Use.

When the four cells (figure 1) are complete, fill a large jar with enough cold water to fill the four smaller jars about three-quarters full. Into the cold water pour one pound of pure ammonium phosphate and stir until it is all dissolved. Put an equal quantity of this solution in each jar.

The rectifier is now complete, but it remains to be connected up properly as shown in figure 2. A rheostat should be used in series with the alternating current and the rectifier. For purposes requiring little current a 16-candle-power lamp can be used as a rheostat.

D. P. Morrison, in the February, 1910, issue of *Popular Electricity*, gives instructions for making an electrolytic rectifier that will deliver a direct current of 3 to 6 amperes at 15 to 25 volts from an alternating current reduced to about 30 volts by a rheostat. This apparatus consists of four cells made in much the same manner as those described above with the excep-

tion that a carbon rod or plate replaces the lead pipe. The electrolyte to be used is a solution of sodium phosphate acidulated with sulphuric acid. The jars are filled with a saturated solution of sodium phosphate to within 1 inch of the top, then, assuming that the alternate current voltage is 30, sulphuric acid is added to each jar until the direct current measures 5 amperes on a full load. This rectifier is connected up for use in the manner shown in figure 2.

T. C. Stanleigh is the author of the article in *Electrician and Mechanic*. Each cell in his apparatus contains two lead plates and one aluminum plate. For use with a low-voltage transformer current of 25 volts or less the jars are to be filled with diluted sulphuric acid. With a 110-volt current the jars should be filled with a saturated aqueous solution of sodium bicarbonate, or sodium borate. For a 220-volt current a saturated solution of ammonium phosphate is the best electrolyte.

In using a rectifier with a high-voltage current care must be taken to prevent the full force of the flow at the start by interposing a rheostat or other resistance.

When a 4-cell rectifier is delivering a current of more than 5 amperes it will become heated resulting in a falling off in efficiency. To obviate this, Mr. Morrison suggests passing a current of cold water through a coil of glass tubing immersed in the electrolyte.

Bovine.—"Inquisitive," Pennsylvania.—As we have said in regard to the making of chewing gum and several other things, something more than a mere formula is needed by the man who would engage in manufacturing certain preparations, the "formula," indeed, sinking to a place of secondary importance as compared with knowledge and skill of the manipulator, born of experience, and factory equipment. The proprietors of bovine supply a very simple formula for it, but whether a druggist can take this formula and turn out a successful preparation, is quite another matter. The formula follows:

Defibrinated bullock's blood.....	65 per cent.
Desiccated egg albumin.....	19 per cent.
Bourbon whisky.....	10 per cent.
Pure glycerin.....	5 per cent.
Boric acid.....	1 per cent.

Atropine in Oil.—R. J. W., New York, has been asked to make a solution of atropine sulphate in olive oil, 4 grains to the ounce, but finds that the salt does not dissolve in the medium to that extent, and asks for help.

If a solid will not dissolve in a liquid, hot or cold, there is no way to make it do so; but sometimes the solid or the liquid may be changed without interfering with the therapeutic results which the prescriber of the combination had in mind. In this case perhaps the best thing to do is to suggest to the physician that an equivalent quantity of the alkaloid be used, instead of the salt, as atropine may be dissolved in olive oil by the use of a gentle heat.

Pepsin Chewing Gum.—S. W., Colorado.—Some suggestions and formulas for making chewing gum appear in the *Circular* for February, page 83. During the process of manufacture, pepsin may be incorporated in gums made according to these formulas, in any desired proportion.

Sour Milk and Longevity.—J. E. F., Massachusetts.—Dr. Elie Metchnikoff, a European savant, after a study of the effect of sour milk on the human organism, concluded that a certain milk bacillus, which he speaks of as the Bulgarian bacillus, has a beneficent influence on the intestinal fluids of those who take it into their systems. This bacillus, he believes, tends to retard that hardening of the arteries which is largely responsible for many of the ills of old age, if not for the ill of old age itself.

From a recent article on the subject by Dr. Metchnikoff, appearing in the *New York Times*, we quote:

This fermentation in our digestive intestines may be responsible not only for diseases of the digestive apparatus, but it is also the source of poisoning the organism.

Several years ago I suggested to combat the process of fermentation in the digestive organ and its injurious consequences by the aid of milk ferments. I supposed that the acid produced by these microbes would be effectual in hindering the multiplication of the ferment-producing microbes.

I saw clearly all the difficulties connected with the effort of introducing the new milk microbes into the intestinal flora, which is already occupied by numerous other microbes. To secure the most certain result, I selected a milk microbe which is the strongest acid producer. It is of Bulgarian origin, and is to be found in sour milk in the Balkan States and even in the Don region in Russia.

To prove the effect of the milk microbes it was necessary to take them for a long time daily—for weeks and months—so I used only the pure culture of such microbes. Yagurt, as well as kephir, koumiss, and other various sorts of sour milk, which are for sale, had to be excluded, in view of the fact that these products contain other microbes, some of which are injurious to the human body.

Pure cultures of milk microbes may be prepared either in sterilized or simply boiled milk, or in various bouillons containing some sugary ingredients.

These cultures should be taken in the form of sour milk, or bouillon—this is better than to take them in a more or less dried form. Although the milk bacilli live also in such a form, it is harder for them to multiply and resist the struggle against the microbes which are already accustomed to living in the intestines.

It should be remembered that milk microbes, especially the best of them, such as the Bulgarian bacilli, are not easily adapted to our digestive apparatus. For this they need sugary substances which are not to be found in the remote regions of our digestive apparatus.

Of all foodstuffs used by man, only dates (as our collaborator Alberto Bertello proved by his investigations) are capable of bringing such sugary substances into those regions of the digestive apparatus. Having established the fact that dates constitute a very wholesome food, which may be seen from the long experience of some Arabian nations, we decided to prepare these fruits with pure cultures of Bulgarian bacilli in the form of very tasty candy.

Unfortunately difficulties were encountered which made it impossible to prepare these candies for the public at a low price. As there is as yet no way in which to make them more accessible to the public, one may content himself with using cakes prepared with live and quite active Bulgarian bacilli, adding some good dates to the mixture.

After several years of use, milk ferments have made for themselves a solid place in therapeutics. In certain countries physicians have tried successfully to use them in curing intestinal diseases.

The facts we have gathered show that milk bacilli can hinder the activity of typhoid and other bacilli.

The purpose we are pursuing in our investigations is to transform our intestinal flora from a so-called wild state, which is inhabited by injurious microbes, to one that should be cultivated and beneficial to our health.

The facts I have gathered prove that this aim is not at all a dream. It is but necessary to recall that dangerous typhoid bacilli can be driven out and replaced by the Bulgarian bacillus. It is indisputable that this is only the first step in the series of experiments which should be made in the effort to disarm the danger threatened to us by the intestinal microbes. I am willing to admit that the remedies recommended thus far are quite imperfect.

There is still a great deal to be done. The present meth-

ods are but of a preliminary nature. Recently failures were cited among cases of treatment of intestinal diseases by the aid of milk bacilli. I am convinced that a considerable portion of these failures was due to the poor quality of the preparations used. Through commercial motives, some manufacturers of milk ferments prepare them in pressed form, which cannot be recommended, as in such form the bacilli are in a state of insufficient activity.

Analyzing these products, I very often found instead of the Bulgarian bacillus other bacilli of entirely different forms, sometimes injurious. No wonder that such preparations are more harmful than useful.

I believe that it would be proper to subject the preparation of milk ferments by the pharmaceutical industry to the same control to which the preparation of antitoxin serums is subjected. I believe that under such conditions the treatment by the aid of milk bacilli would yield better results.

Having no patients on whom I could make systematic observations, I turned to myself. For many years my health left much to be desired. Having applied unsuccessfully various forms of treatment, I turned to my own method, and I consider the results satisfactory.

I discontinued the use of all drinks containing alcohol, and also the use of all raw foods. I drink only boiled water and boiled milk or very weak tea. As food I take every day a small quantity of meat, and especially carbohydrate stuffs, cooked vegetables, and stewed fruits. To this regimen I add from one to two pots of sour milk, prepared with paralactic bacilli, and also a small cake containing the Bulgarian bacilli, which I eat with jam. Besides this, I eat as many dates as I can containing Bulgarian bacilli, or simply cooked in boiling water.

This regimen I have kept up only recently. But for twelve years I have not used any raw fruits or raw vegetables, and have taken milk ferments in sour milk.

With the introduction of such a regimen my health has improved to such an extent that notwithstanding my sixty-five years I can do a great deal of work. I come of a family in which longevity was unknown (all my brothers dying much younger than I am now), and I consider that I owe this happy result to my regimen. There will be nothing surprising if my active life will stop very soon, for I did not commence to follow this rational regimen until I was already fifty-three years old, having done before that everything that could break down my health. I advise young people who wish to attain a healthy old age to commence this regimen as soon as possible.

Now we come to the question which is often debated in connection with the use of milk microbes, namely, the question of longevity.

In none of my works on this subject—notwithstanding the statements put into my mouth by certain journalists—did I ever declare that sour milk can prolong human life. I developed the thesis that in our premature senility the intestinal microbes must play an important role, and I proposed the use of milk microbes for the purpose of changing the flora and diminishing fermentation in the intestines.

As some of the poisons in the digestive organs act upon the arteries and cause arterio-sclerosis, one of the main symptoms of premature old age, there is nothing surprising in the supposition that the agents which hinder the activity of such poisons can slacken the premature feebleness of our organs. And as milk microbes occupy the first place among these agents, we have a right to suppose that they must exert a favorable influence in the sense of longevity. But it is still necessary to gather many facts to make this supposition an invincible reality.

Notes on this subject appear also in the issues of the CIRCULAR for April, 1910, page 164; and January, 1908, page 27.

Emulsion of Paraldehyde.—Senega is suggested in the *Prescriber* as a good emulsifying agent for paraldehyde. The following formula for an eligible preparation is offered by that authority:

Paraldehyde	4.0 c.c. (mils).
Syrup	6.0 c.c. (mils).
Tincture of orange.....	0.6 c.c. (mil).
Infusion of senega.....	12.0 c.c. (mils).
Water.....	enough to make 30.0 c.c (mils).

Moxie.—I. E., New York.—We do not know how this beverage is made, or what percentage of alcohol it contains, but have seen a statement to the effect that it was prepared from oats (*avena sativa*) and flavored with sassafras and wintergreen; although it is claimed by the manufacturers that it comes from a South American cane.

In expressing his opinion upon "valid evidence" and similar topics during the suit of the Moxie company versus the Modox company, Judge Brown in the United States circuit court, at Providence, R. I., had this to say a few years ago about the mystical origin of the name occasioning this contest: "The evidence raises serious doubts as to Lieut. Moxie, the discoverer. The existence of Lieut. Moxie can hardly be regarded as a trade secret. No one but Dr. Thompson seems to have known about him, so far as this record discloses. But wherever Dr. Thompson may have found the name 'Moxie,' there remains a strong suspicion that Lieut. Moxie got his name from Dr. Thompson."

Several years ago we printed a formula for a preparation said to resemble moxie, which is as follows:

Oil of sassafras.....	15 minims.
Oil of wintergreen.....	15 minims.
Alcohol	1 ounce.
Fluidextract of gentian.....	1 ounce.
Compound syrup of sarsaparilla....	8 ounces.
Caramel	1 ounce.
Syrup.....	enough to make 5 pints.

Onion Syrup.—J. M. C., Montana.—This may be made just as syrups of other "fruits" are, by slicing or contusing the bulbs and placing them in a suitable vessel, preferably one with an outlet at its bottom, alternating layers of onions with layers of sugar, and setting the vessel aside in a warm place. As to just how stable a syrup so made would be, we are unable to say, but believe that it would keep as well as one made in any other manner. As to its palatability—well, there is no accounting for tastes.

An artificial onion syrup may be made by the use of oil of garlic—natural or synthetic. This leaves nothing to be desired in the way of strength—except a lack of it.

A formula for syrup of garlic, adaptable to the making of a syrup of onion, was given in the *Pharmacopœia* of 1890, and may now be found in the appendix of the National Formulary.

We are glad to be able to say that the demand for flavor of this kind is so small that we believe we have not been called upon to supply information on the subject since the appearance of a note on "Extract of Onion" in the *CIRCULAR* for June, 1904, page 132.

Orrine Liquor Habit Cure.—F. X. D., Illinois.—We have learned nothing new about this preparation since the publication of our note on the subject in the *CIRCULAR* for May, 1910, page 235, in which we said that we did not know its composition but that it was said to contain a minute amount of a mercury salt as its active constituent. Orrine is mentioned in the "Great American Fraud" series in *Collier's Weekly* for September 22d, 1906. A note on various treatments for the liquor habit, with formulas, appears in the *CIRCULAR* for July, 1907, page 473; and one on the "fake" character of the advertised liquor-habit-cures is given in the issue for March, 1908, page 126.

An Exercise in Polypharmacy.—P. D. H., Pennsylvania, writes: "Please publish in your next issue how you would compound the enclosed prescription. Everything on the front and back of the blank was placed there by the doctor when given to the patient. What should be the color? and would there be any precipitate? The doctor will not permit any change in or any addition to the formula."

The prescription reads—

R	Urotropin	3ij.
	Caffein <i>Alk.</i>	3j.
	Pilocarp Mur.....	gr j.
	Nitroglycerin [sic].....	3j.
	Hydrarg Chlor Corros.....	gr ij.
	Mist. Basham's q. s.....	℥iv.

M et Sig—3j every 3 hours.

Dr. ———

Warm and filter to make clear solution.

On the reverse side were these directions:

Compound this prescription carefully, only heat until solution is formed; then filter while in solution, keep in warm place until filtered.

We did just about all that the doctor ordered except that we used 1 dram of solution of nitroglycerin instead of the explosive seemingly prescribed, as the nitroglycerin itself not only is not a medicine, but could be handled only with extreme risk; and the dosage of the solution corresponds to the quantity prescribed; if the "crude" were used, the quantity given would be enormously in excess. The resulting preparation was a clear cherry-red solution—for a few minutes. Then it became a white feathery mass of needle-like crystals. This was doubtless due to the precipitation of the caffeine by the mercuric chloride, the influence of this salt on alkaloids in solution being well known. One would also expect the mercuric chloride to precipitate the pilocarpine and also the urotropin. This last-named substance is rather an unknown quantity, but its official analogue is precipitated by the mercuric salt.

Because urotropin is decomposed by hot water, we compounded the mixture as follows: We made the Basham's mixture up to the point of adding the required amount of water. In this solution we dissolved the caffeine with the aid of a gentle heat. The urotropin and the pilocarpine hydrochloride we dissolved in about 3 drams of cold water and the mercuric chloride in a few drops of hot water. When the iron-caffeine solution had cooled a little we added the urotropin solution, then the solution of nitroglycerin, and lastly the solution of the mercuric chloride. In any case a dangerous precipitate is likely to occur.

Glycerite of Heroine.—C. O. H., Illinois.—Our knowledge of the composition and mode of preparation of *glyco-heroin* is limited to the statement which has appeared in the *CIRCULAR* a number of times to the effect that it is said to contain ½ grain of heroine hydrochloride to the ounce, combined with glycerin, balsam of tolu, white pine bark and ammonium hypophosphite, colored with caramel, and 3 per cent. of alcohol. It is not a difficult pharmaceutical operation, however, to prepare a glycerinated syrup containing the ingredients you mention. How this would compare with the preparation in question is of no importance if the therapeutic results are as you wish.

Directions for making a somewhat similar preparation, for use in veterinary practice, appear in the *CIRCULAR* for January, 1908, page 27.

Compound Solution of Resorcinol.—L. A., Pennsylvanica.—We know of no "recognized compound solution of resorcin"; neither have we any knowledge of a solution containing resorcinol and sodium thio-sulphate. The following preparation recognized in the British Pharmaceutical Codex might be called a compound solution of resorcin:

Spirit of Resorcin B. P. C.

Resorcinol	2.5 grammes.
Castor oil.....	2.5 c.c. (mils).
Cologne spirit.....	20.0 c.c. (mils).
Alcohol, enough to make....	100.0 c.c. (mils):

We should be glad to pass along any information our readers may have relative to a preparation with the name mentioned by our querist.

Pricing Prescriptions.—J. E., New York, wants particulars as to the tables of prescription prices referred to in an issue of the CIRCULAR a few years ago as having been compiled by Prof. Ruddiman and by the National Association of Retail Druggists.

Ruddiman, in his work on Incompatibilities in Prescriptions, gives the following table showing the "average of prices charged in the various sections of the United States for prescriptions not requiring extraordinary skill or calling for any very expensive ingredients:

Liquids.		Powders, Capsules, or Pills.	
1 ounce.....	20 to 25 cents.	1 to 4.....	15 to 25 cents.
2 ounces.....	30 to 35 cents.	5 to 6.....	25 to 30 cents.
3 ounces.....	35 to 40 cents.	8.....	30 to 35 cents.
4 ounces.....	40 to 50 cents.	10.....	35 to 40 cents.
6 ounces.....	60 to 65 cents.	12.....	40 cents.
8 ounces.....	75 cents.	24.....	50 to 75 cents.
Ointments.		Suppositories.	
½ ounce.....	25 cents.	½ dozen.....	40 to 50 cents.
1 ounce.....	30 to 35 cents.	1 dozen.....	75 to 100 cents.
2 ounces.....	40 to 50 cents.		

Below is a copy of a leaflet issued from N. A. R. D. headquarters:

The N. A. R. D. Prescription Pricing Schedule.

The Figures Are Compounding Fees Only.

Liquid Prescriptions: Minimum charge, 25 cents. All simple or compound mixtures, internal or external, dry or liquid, eye or private disease remedies, and veterinary.

Quantity.	Dose.	Dose.	Dose.	Dose.	Gargle and External only.
	1-5 M.	10-25 M.	dr. ss-dr. i.	dr. ii-oz. i.	
½ oz.	.25	.20	.15	.10	.10
1 oz.	.35	.30	.20	.15	.10
2 oz.	.45	.35	.25	.20	.15
3 oz.	..	.40	.30	.25	.20
4 oz.	..	..	.35	.30	.25
6 oz.	..	..	.40	.35	.30
8 oz.	..	..	.45	.40	.35
12 oz.	..	..	.55	.45	.40
16 oz.	..	..	.60	.55	.50
32 oz.	..	..	.75	.70	.65

Proprietaries: Original package, regular retail price. When costing over \$2, \$4 or \$8 per dozen, add 65 per cent. to cost. When transferred to new container, add 15 per cent. to regular retail price. When part of package is dispensed, double cost of amount used and add charge for container (see below).

Dry and Fatty Prescriptions: Minimum charge, 15 cents. These figures are compounding fees only.

Pills, Powders, Capsules, Wafers, Etc.: 4, 10 cents; 6, 15 cents; 8, 20 cents; 10, 25 cents; 12, 30 cents; 15, 35 cents; 20, 40 cents; 24, 45 cents; 30, 50 cents; 40, 60 cents; 50, 70 cents; 60, 80 cents; then every additional 10 up to 100, 5 cents. After that 10 cents for every additional 25.

Proprietaries costing 20 cents per 100 or less, 10 cents per dozen and 10 cents for labeling and package. Costing over 20 cents per 100, 15 cents per dozen and 10 cents for labeling and package; with those exceptions

as noted in the N. A. R. D. Price List. (A copy of which will be mailed to members for 25 cents. The price to non-members is 50 cents.)

Ointments and Cerates: ½ ounce, 20 cents; 1 ounce, 25 cents; 2 ounces, 35 cents; 3 ounces, 45 cents; 4 ounces, 55 cents; 6 ounces, 65 cents; 8 ounces, 75 cents; 16 ounces, \$1.

Suppositories, Bougies, Etc.: 1, 10 cents; 2, 20 cents; 3, 30 cents; 4, 40 cents; 5, 45 cents; 6, 50 cents; 8, 60 cents; 10, 65 cents; 12, 75 cents; 15, 90 cents; 18, \$1.05; 20, \$1.20; 24, \$1.35; 30, \$1.60; 36, \$1.80.

Containers: Pill and powder boxes, 5 cents; ointment boxes, 5 cents; ointment jars, 1 ounce, 5 cents; 2 to 4 ounces, 10 cents; 8 ounces, 15 cents; bottles, 8 ounces or less, 5 cents; 10 to 16 ounces, 10 cents; 32 ounces, 15 cents; ½ gallon, 20 cents; 1 gallon, 25 cents; glass stoppered bottles, three times the price of plain bottles.

Veterinary: Charge same as for other prescriptions.

Household Remedies, Mixtures, Etc.: Add regular retail price of ingredients (none less than 5 cents) and charge for container. If any compounding is necessary, charge at rate of \$1.50 per hour.

Marking Price on Prescriptions.

If a prescription or copy leave your store, mark it with N. A. R. D. price, as follows:

P H A R M O C I S T
1 2 3 4 5 6 7 8 9 0

Admissible Changes: If customer is poor, add a star (*) to price mark, showing you have gone below schedule price. If your present prices are lower than above, raise them gradually to schedule prices.

Important How to Fix Price: The price of the prescription is the compounding fee, + the cost of the container, + twice the cost of the material. (Exception: When the cost of material is over \$1, multiply cost by 1½ instead of 2.) These prices are based on an approximate \$1.50 per hour scale.

Soap Bubble Liquid.—E. B. B., New York.—Below we present a collection of formulas and suggestions for those who would experiment with soap bubbles:

I.

Castile soap.....	2 ounces.
Mucilage of acacia.....	2 drams.
Glycerin	4 ounces.
Water.....	enough to make 1 pint.

This should be diluted for use.

II.

Powdered castile soap.....	300 grains.
Granulated sugar.....	300 grains.
Soft, pure, warm water.....	2 pints.

Dissolve the soap in the warm water, set aside for twenty-four hours, decant to get rid of any sediment and add the sugar.

III.

Castile soap.....	3 drams.
Boiling water.....	1 pint.
Glycerin	2 ounces.

Proceed as in the above.

It is said that palm oil soap is superior to castile soap for making soap bubbles, and we have also heard that waterglass added to the suds from which the bubbles are blown, will make the latter tough.

Soap Bubble Flowers.

To make soap bubble flowers, bend a piece of copper wire into the shape of the flower, dip it into the soap bubble liquid, and place it under a glass jar. Behind the jar, set near a window, place a black background, against which the flower appears in changing colors as the light is reflected and refracted by the bubble film.

Yellowishness of "Lotio Alba."—J. L. A., Pennsylvania.—So indefinite is the composition of sulphurated potassa that its behavior when combined with zinc sulphate, as in the making of the popular "white wash," is liable to be quite uncertain. Sometimes "liver of sulphur" is a mixture of potassium trisulphide and potassium thiosulphate; if prepared at a higher temperature the mass consists principally of potassium trisulphide and potassium sulphate. In both products a little potassium carbonate and more or less sulphur are generally present.

In direct ratio to the proportion of combined sulphur present in sulphurated potassa is the depth of the color of aqueous solutions of the compound and the amount of free sulphur formed when the sulphurated potassa is decomposed. As this free sulphur will not combine with the other decomposition products formed in "lotio alba," upon the proportion of sulphur present depends largely the color of the precipitate in the "wash." Obviously if the yellowness is due to sulphur it can not be gotten rid of and can be obviated only by the use of sulphurated potassa containing no thiosulphate. A yellow tint may be imparted to the precipitate by iron or copper sulphide, salts of these two metals often being present as impurities in zinc sulphate. The yellow color of the "wash" may be in the liquid and not in the precipitate. In this case the addition of more zinc sulphate will usually rectify matters.

To avoid an undue amount of odor of hydrogen sulphide it is well to dissolve the sulphurated potassa and the zinc sulphate separately in portions of the water and filter the solutions through cotton or asbestos fiber before mixing them.

Father John's Medicine.—In a note on this subject in the CIRCULAR for last month, page 142, we said that it looked as if it were up to some old Boston druggist to supply a copy of the doctor's prescription in question. F. E. Dudman, at present of South Carolina, but for twenty-two years a druggist in Boston and Lynn, now writes:

The fact that "Father John's" is merely "Hyneman's black bottle" is generally conceded and I send you an old formula for the same by which I have made many gallons of this famous old emulsion. It is—

Cod liver oil.....	10 ounces.
Extract of glycyrrhiza.....	2½ drams.
Confection of almond.....	1 dram.
Spirit of peppermint.....	4 drams.
Compound tincture of lavender.....	4 drams.
Syrup of tolu.....	4½ ounces.

Make an emulsion.

We thank this "old Boston druggist," even if he is an "ex-," and again extend to all our readers an invitation to send in their practical notes and formulas whenever they have any to offer which they think would be of general interest.

Re-Silvering Mirrors.—F. R. S., Iowa.—A note on this subject, with formulas, may be seen in the CIRCULAR for March, 1907, page 267, and other articles along the same line appear in earlier issues. As few pharmacists are interested in the matter except from an academic standpoint, as no one without proper equipment and a considerable amount of experience should expect to turn out a satisfactory job of this kind, we think we should hardly be justified in taking the space to repeat these notes here.

Compound Phospho-Muriate of Quinine.—A. A., New Jersey.—We do not know anything more about the composition of the proprietary article you mention than is told on its label. According to that, each dram of the preparation contains—

Free phosphoric acid.....	2 minims.
Potassium phosphate.....	2¼ grains.
Magnesium phosphate.....	2¼ grains.
Calcium phosphate.....	2¼ grains.
Ferric phosphate.....	2¼ grains.
The equivalent, in "muriate," of quinine bi-sulphate.....	½ grain.
Strychnine	1/120 grain.
Flavoring and syrup.....	enough.

Amount of Cocaine Used in the United States.—L. L., New York.—Using the custom house reports as a basis of calculation, it is estimated that the amount of cocaine used in this country is in the neighborhood of 120,000 ounces annually. It is known, however, that much cocaine is smuggled into the country, there having been a conviction for this offense in this city only last month. The world's consumption of cocaine has been estimated at 12,000 kilos (about 423,300 ounces) per annum.

Danger of Repeating Serum Injections.—C. I., Michigan.—As your query is a medical rather than a pharmaceutical one, and yet of general interest to pharmacists, we have asked a physician who has made a special study of the question raised therein to answer it. This physician is Dr. R. G. Eccles, and his answer follows:

In reply to your correspondent who asks if it is true that antistreptococcic serum can be used only once, in the same individual, for blood poisoning, and if so why, I would say that it is not advisable to use any kind of alien serum more than once unless there are indications that the first injection was too small, and then the second injection should quickly succeed the first, say within twenty-four hours. The very remarkable fact has been discovered that all alien proteins (formerly called albumins) from every source—plant, animal, bacterium, or protozoon—if injected into a human being or an animal twice, and the second injection is given in from eight days to fourteen days of the first, may prove fatal in exceedingly minute amounts. The white of egg, three times crystallized to make its purity and freedom from all kinds of poisons absolutely certain, has repeatedly and promptly killed rabbits and guinea pigs. So deadly is egg-white, when administered in this way, that *one-fifty-thousandth of a cubic centimeter of a solution containing but one-millionth of a gramme of protein produced death.* (See the *Journal of Infective Diseases*, for October 20th, 1908, page 455).

Meat, milk, serums of many kinds, the proteins of wheat, corn, beans, peas, nuts, etc., etc., are all as deadly as disease when injected in the way mentioned. They do not kill as strychnine or aconite would—at a first injection—but neither strychnine nor arsenic is a circumstance in its deadliness compared with these common articles of food after our cells are sensitized to them. Given the so-called time of incubation—the eight to twelve days—and they produce fever, skin eruptions, malaise, fatigue, shortness of breath, and other of the many common signs of ordinary diseases, in minimal doses, and death in slightly larger ones. None of them seems to do any particular harm at the first dose. It is the second injection that is the serious one, producing what is technically known as anaphylaxis, and it is not serious under about eight days. Where there is an idiosyncrasy to one or other of the proteins named, the first injections are usually serious, for the patient has, somehow, become sensitized in advance. Herbivorous animals can be sensitized to meats, eggs, etc., by way of the stomach, but carnivorous animals are immune to such foods taken by that route. Carnivorous animals are capable of being sensitized to plant proteins by way of the stomach, but animal proteins do not

readily affect them through this channel. The herbivorous animal digests all plant proteins *completely*, but fails to do so by large quantities of animal proteins. The carnivorous animal digests all animal proteins *completely*, but fails to do so by large amounts of plant proteins forcibly fed. All proteins are rendered absolutely harmless, *no matter how often injected*, when they are completely digested, even in a test tube. An animal's own serum, or serum from its own species (autogenous serum), does not produce anaphylactic shock. Human serum injected into human beings can safely be repeated.

A hospital apothecary to whom the matter was mentioned says that the query brings out the strongest point to be made in favor of autogenous vaccines or bacterins, that is, that they do not produce the result to which you have referred. He says: "That there is produced a decided anaphylaxis by the use of the 'stock' vaccines is conceded by most practitioners and, often, in the smallest doses. Streptococcic bacterins have been administered in this institution in cases of septicemia in daily doses to the same patient without any deleterious effects, always, of course, of autogenous origin."

Anonymous Queries.—B. O., Nebraska.—Your attention is called to the standing notice at the head of this department in which it is stated that queries, to be answered by us, must be accompanied with the name and address of the writer. Not only do we keep that notice standing, but almost every month we print a note similar to this one, calling special attention to it; and now and then we give our reasons for having made such a rule.

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Mitchell's Magic Lotion.—F. G., California.

Woofter's Corn Remedy.—J. L. C., Massachusetts.

Caementium.—E. J. C., Michigan.

Booth's Mi-o-na.—E. J. C., Michigan.

Pazo Ointment.—E. J. C., Michigan.

Sanford's Liver Invigorator.—F. E. S., Michigan.

Casler's Oriental Paste.—P. P., Illinois.

Glycerin Skin Cream.

Hydrous wool-fat.....	4 ounces.
Glycerin	4 ounces.
Distilled water.....	4 ounces.
Castile soap.....	75 grains.
Oil of rose.....	15 drops.

Dissolve the soap in the water and add the glycerin. Place the wool-fat in a warmed mortar and gradually beat in the solution. When cool, add the perfume.

Benzin Ignited by Friction.

It has long been known that in rubbing articles in cleaning with benzin there is risk of producing an electric spark and consequent ignition of the highly inflammable liquid. This kind of accident occurred recently in a nearby town. A woman was cleaning some fur with benzin; while rubbing the fur a spark was produced, the benzin ignited and the woman was badly burned on the face, hands and arms. This accident again exemplifies the great danger of handling benzin. It is liable to become ignited from entirely unexpected sources. Even pouring from one vessel to another carries some risk of developing a spark.

Some Adhesives.

Liquid Cement.

Gelatin	100 parts.
Water	100 parts.
Zinc chloride.....	1 part.
Hydrochloric acid.....	enough.

Heat the gelatin with the water on a water-bath until the mixture becomes homogeneous. Add the zinc chloride and continue the heat until a portion of the mixture does not set solid when allowed to cool. Sometimes a little more zinc chloride is required. If the liquid is alkaline it must be neutralized with hydrochloric acid.

Liquid Glue.

Slaked lime.....	5 grammes.
Sugar	200 grammes.
Glue	enough.
Water	enough.

Mix the lime intimately with the sugar and add enough water to make 600 c.c. (mils). Heat the mixture to about 65° C. and maintain this temperature for about three hours, stirring the mixture occasionally. Allow the mixture to cool and settle; decant as much liquid as possible, and in this liquid dissolve glue in the proportion of 1 to 5.

Cement for Porcelain.

Sandarac	30 grammes.
Mastic	30 grammes.
Oil of turpentine.....	30 c.c. (mils).
Isinglass	enough.
Glue	enough.
Water	enough.
Alcohol (90%).....	500 c.c. (mils).

Dissolve the resins in the alcohol, and add the oil of turpentine. Make about 500 c.c. (mils) of a rather strong solution of glue in hot water and add to it a quantity of isinglass equivalent to the amount of glue used. Heat this mixture slowly until it begins to boil. Pour the hot liquid slowly into the alcoholic mixture, stirring constantly, until a paste, thin enough to strain through muslin, is formed.

Improved Copper Fungicide.

Perrin is quoted in the *Chemist and Druggist* as considering the following a more energetic horticultural fungicide than Bordeaux mixture:

Copper sulphate.....	1 part.
Sodium sulphate.....	1 part.
Soap	10 parts.
Water	40 to 90 parts.

Bismuth Gauze.

As a succedaneum for iodoform gauze, preferable because of its inodorosity and because it does not cause thyroidism, Wiener (*Internatl. Hosp. Rec. through Prescriber*) has introduced a bismuth gauze made as follows: Two ounces of bismuth subnitrate are thoroughly mixed with the same quantity of glycerin; 1 quart of warm water is gradually added, the mixture being constantly stirred so as to make a fine emulsion. A portion of about 21 yards of gauze is passed slowly through this emulsion three times so as to soak it thoroughly, after which it is wrung out. The gauze is then dried, cut into strips, loosely packed, and sterilized by steam for thirty minutes. The strength may be increased without harmful effects should the occasion warrant it.

Maine Board Questions.

Herewith is reprinted a set of questions recently supplied by the secretary of the Maine Board of Pharmacy. An examination of the files of the CIRCULAR for the past score or more of years does not discover another set of questions used by this board.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give to our readers, just as nearly as practicable, the questions as they were presented to the candidates.

Pharmacy.

1. (a) What is meant by the term Solution? (b) How much Silver Nitrate will be required to make four fluid ounces of a 3% solution? (c) What is the objection to the use of heat in making extemporaneous Saturated Solutions?

2. (a) Give official name for Seidlitz Powders. (b) State quantity and official name of each ingredient each powder contains. (c) Under what conditions should they be prepared and preserved?

3. (a) How much Corrosive Mercuric Chloride would be required to make one gallon of a 1 to 2000 solution? (b) Spirit of Camphor U. S. P. is made as follows:—

Camphor, 100.Gm.

Alcohol ad, 1000.Gm.

Camphor costs 96c. per pound, and Alcohol \$2.65 per gallon. What is the cost of a pint of Spirit of Camphor?

4. (a) Name five substances which are incompatible with solutions containing alkaloids. (b) How many minims of Tincture of Opium, U. S. P. correspond to one grain of Powdered Opium? (c) In a mixture of lard two pounds, wax four pounds, and spermaceti one pound, what is the per cent. of each constituent in the whole mixture?

5. What is meant by Distillation, Sublimation, Communion, Dialysis, Percolation?

6. What is the United States Pharmacopoeia?

7. (a) What is the meaning of the term Specific Gravity? (b) How would you define the term Specific Volume? (c) What is the weight (Avoirdupoise) of a pint of glycerine? (d) A druggist buys 500 Grammes of Ether for 75c. and sells four fluid ounces for 45c. Just how much profit does he make on the sale?

8. (a) Name the ingredients of Pulvis Glycyrrhizae Compositus. (b) Give official name and formula for Compound Chalk Powder. (c) Give official name and formula for Dover's Powder. (d) What is meant by a No. 40, No. 60, or No. 80 sieve?

9. (a) Name the different methods by which the U. S. P. medicinal syrups are prepared. (b) Give formula and method of preparing Syrup of Ferrous Iodide. (c) Name the ingredients of Compound Syrup of Squill.

10. (a) How much quinine, strychnine, and ferric phosphate would be required to make 1000 cubic Centimeters of elixir iron quinine and strychnine phosphates, so that each fluid drachm of finished elixir should contain 1.64 grain of strychnine, one grain of quinine, and two grains of ferric phosphate? (b) How many grains in two ounces of water? (c) If moist opium, containing 10½% morphine, loses 30% of its weight in drying, what per cent. of morphine will it contain when dry?

Pharmaceutical Chemistry.

1. (a) Define Specific Gravity. (b) Define Specific Volume. (Note. Illustrate each definition by example to show that they are clearly understood.) (c) How would you take the Specific Gravity of Glycerin by means of the Specific Gravity bottle?

2. (a) State the difference between a Mixture and Chemical Compound. Illustrate. (b) Give example of a Molecular Mixture. (c) What is the difference between Analytic and Synthetic methods in Chemistry? Illustrate.

3. Acids. (a) By what rule do acids receive their names? (b) What prefixes and affixes are used to the hydrogen acids and why? (c) What prefixes and affixes are used to the oxygen acids and why? (d) What acid radicals are found in the chemical formulas of the following: (a) sulphates, (b) Carbonates, (c) Sulphites, (d) Acetates, (e) Tartrates.

4. (a) What is the composition of common salt? (b)

What difference exists between Sodium Carbonate and Sodium Bicarbonate both in regards to physical and chemical properties? (c) How can commercial Sodium Bicarbonate be purified so as to answer Pharmacopœial requirements?

5. (a) What is Benzene? (b) Differentiate between Benzene, Benzin, Naptha, Gasoline. (c) Name two preparations common in pharmacy which are derived from Benzene, and show by equation the preparation of one of the two mentioned.

6. How much Sulphuric Acid will be required to dissolve 10 pounds (avoirdupois) of Zinc?

Mol.wt. Zinc 65;

Mol.wt. Sulphuric Acid 98.

Note. Write equation showing the reaction and leave all figures on examination paper.

7. Carbon. (a) Mention the allotropic forms. (b) What is Carbon Dioxide and how made? (c) Write the reaction which will produce Carbon Dioxide. (d) What relation have the carbon compounds to Organic Chemistry?

8. Iron. (a) What is meant by a Ferric Salt and a Ferrous Salt? (b) How can one be transformed to the other? (c) By what tests can one be distinguished from the other?

9. Aldehydes. (a) What is their general constitution? (b) Name five most familiar in pharmacy. (c) Give in words and equation the process of manufacture of one of the five mentioned.

10. Name two or more official preparations which are chemically incompatible with the following: arsenic, potassium Iodide, Hydrogen peroxide, Lead Acetate, Calomel.

Materia Medica.

1. Give the Botanical name, part or parts employed, active or chief constituents, and average doses of U. S. P. preparations of the following drugs: Peppermint, Cascara, Squill, Poke Root, Calabar Bean.

2. State about the following drugs their Pharmacopœial name: Botanical name of plant from which they are obtained; their habitat, constituents, medical properties and uses: Licorice Root, Buchu, Coca.

3. State which of the following oils are fixed, and which are volatile, also how and from what they are obtained: Oleum Amygdala Amara, Oleum Tigilii, Oleum Morrhuæ, Oleum Camphoræ, Oleum Eucalypti, Oleum Amygdalæ Duleis, Oleum Gaultheria, Oleum Olivæ, Oleum Caryophylli.

4. What is Ergot? What precautions should be taken in the drying and keeping of the same?

5. Cantharis: describe its origin, general appearance, its most active constituents. What are the official preparations? Give doses and uses of the same. Which solvent is best adapted to extract its active principle? Name antidotes for its toxic effect. Commercially which kind of Cantharis is the best? How should it be preserved?

6. Cardamomum: State origin habitat, description, constituents, names of pharmaceutical preparations in which it is used. What variety is the best? Mention two other varieties and three substitutes which should not be used.

7. Socratine Aloes: state habitat, part official, constituents, official preparation, properties, uses, doses and describe how it differs from Barbadoes Aloes.

8. What part of the plant yields the official Hyoscyamus? Name two alkaloids found in this plant.

9. What are Fungi? Name an important drug from this source and give its therapeutic uses.

10. What part of the fruit is nutmeg, and what relation does mace bear to nutmeg?

Polish for German Silver, Brass and Copper.

Sodium chloride.....	2 parts.
Oxalic acid.....	3 parts.
Water	40 parts.
Bolted pumice.....	100 parts.
Oil of turpentine.....	2 parts.
Soft soap.....	12 parts.
Lard oil.....	12 parts.

Dissolve the salt in the water and the acid in this solution. Mix the solution with the powdered pumice; incorporate the soap; then beat in the oils.

Some Questions in Drug Store Mathematics.

Here are a few questions which may interest the drug clerk who wants to keep his knowledge of arithmetic bright until such time as he is ready to "go before the board." We invite clerks to send in solutions of these examples and also to contribute problems of a similar nature for publication here. In these examples official strengths, temperature, etc., are to be understood unless the contrary is specified:

1. A druggist supplies a physician with drugs at a uniform profit of $16 \frac{2}{3}$ per cent. over the actual prime cost. An elixir cost the druggist 32 cents a pint, less a discount of 20 and 2 per cent. How much should the physician be charged for 12 ounces of it?

2. In a rectangular can measuring $4\frac{1}{2}$ by $6\frac{1}{2}$ inches there is oil to the depth of 5 inches. How many pints of oil are there in it?

3. A drug clerk receives a salary of \$18 a week, and is on duty 14 hours a day for 5 days, 6 hours a day on Wednesdays, and 5 hours on every other Sunday, with the alternate Sundays "off." A street car conductor receives a salary of \$12.50 a week and works 10 hours a day for 6 days, and 5 hours on 1 day, each week. Which one receives the higher wages per hour, and how much?

4. A boy of sixteen years, after two years at high school, began to learn the drug business. He received a salary of \$20 a month for the first year; \$25 a month the second year; \$30 a month the third year, and \$40 a month the fourth year. The fifth and sixth years he spent 8 months at college each year, earning \$25 a month during the sessions, \$50 a month during the first vacation, and \$60 a month during the second vacation. His total college fees were \$250. For five years after his graduation he received a salary of \$1,000 a year. Beginning the same year, his eighteen-year-old brother, after four years at high school, began to study medicine. He attended college 4 years, his total fees being \$450; his earnings nothing. Upon graduation he spent for office equipment \$400, and for a horse, harness and buggy, \$300. For his horse's board he paid \$14 a month; for office rent, \$10 a month; and for a boy \$12.50 a month. At the end of 11 years the druggist went into business for himself. As a clerk, how much had his earnings been in excess of what his profession had cost him, and how much must the physician's annual income have been in excess of the expenses enumerated, for him to have made as much as the druggist?

5. A druggist put in a soda water outfit at a cost of \$472, and he and his clerks attended to it at no additional expense for salaries. The cost of syrups, flavors, carbonated water, etc., for the 20 weeks the fountain was "open" was \$2.15 a day (no Sunday work); and the average number of drinks sold was 134 at 5 cents each. The next season he put in a 1900 outfit, hired a dispenser at \$20 a week; spent \$18.50 a day for syrups, crushed fruits, cream, ice cream, advertising, etc., and for the first 20 weeks sold an average of 520 drinks a day at 10 cents each, and 96 at 5 cents each (no Sunday work). During the "off" season of 32 weeks, his average expenses for ingredients and his average sales were just half what they were during the "rush" months, the salary of the dispenser being the same. How much were his profits on the soda business the first year and how much the second, after marking off 6 per cent. for interest on the cost of the outfit?

6. If stationery constitutes one-fourth of a druggist's stock and his annual sales of it amount to \$1,800, one-third of which is profit; and "patents" constitute one-half of his stock and his annual sales of them amount to \$4,200, one-tenth of which is profit, does the stationery furnish or the "patent" half of his stock yield him the greater profit, and how much?

7. With granulated opium at \$7 a pound, and alcohol at \$2.90 a gallon, what is the cost of the ingredients entering into 1000 c.c. (mils.) of tincture of opium?

8. What is the smallest number of even pints (no fractions of a pint to be used) of nitric acid (sp. gr. 1.40) that will balance an even number of pints of water?

9. A bottle filled with nitric acid (sp. gr. 1.40) weighed, with its contents 20 ounces. The same bottle filled with ammonia water, weighed 14 ounces; what is the weight of the bottle alone?

10. What is the weight (in grains) of potassium and what the weight of iodine in 20 grammes of potassium iodide?

Answers to February Questions.

1. 1 pound.
2. First clerk, \$720; second clerk, \$672.
3. 144.
4. $12.48 +$ ounces.
5. 10 cents.
6. 8 ounces, 268 grains.
7. (a) 50 per cent.; (b), $33 \frac{1}{3}$ per cent.
8. Loss (the difference between 20% and $16 \frac{2}{3}\%$).
9. Taking no account of the expenses of doing business, 8 cigars are profit; the loss of 9 cigars would mean actual loss.
10. Alcohol 2 parts, water 1 part.

Health as a National Asset.

In a paper read by F. F. Westbrook at the meeting of the Second National Conservation Congress and recently published in the *Journal of the American Medical Association*, the value of life and health to our national prosperity are pointed out. The author says that we cannot disassociate the conservation of health and life from that of our other national resources, and he points out the failures and difficulties of the past and the reasons why the fact has been so little appreciated up to date. Disease is a manifestation of life that is capable of modification, prevention or cure by human agency; and even death may be postponed by the same means. The national annual loss from neglect of these matters in the way of preventable disease and death has been estimated as high as a billion dollars annually. He points out, however, the difficulties we have to meet in the eradication of sickness and postponement of death. The absence of any general method for meeting the needs is one difficulty; there is no universal method of cure or prevention, and the individualistic tendency which we have to contend against is another. Public apathy in regard to the subject must be overcome. Private effort alone is too often inefficient. Law has to follow public opinion and the public is not yet fully educated as to its needs, though at the present time the public press and other publications, government and private, are overflowing with information on the subject. What Americans can do when supported by authority in the way of eradicating disease has been shown in our tropical dependencies. At home we have the brains to do the work; we have not yet learned to delegate the authority and pay the bills. The public health functions of the medical profession are noticed; as yet the public has not learned to employ the profession for its own collective good. The individual is willing to pay for his cure when he is sick, and communities pay the costs of epidemics, but what they seem to want is a cure not protection. There should be a better co-operation and understanding between the medical profession and the public.

Working Against Tuberculosis by Posters.

Twenty thousand large posters are being placed on the billboards in various places throughout the country by the National Association for the Study and Prevention of Tuberculosis. The National Billposters' Association has donated free space, the Poster Printers' Association has given free printing, and nine paper manufacturers have given the paper for the posters, which are of six different designs. In graphic form the posters show how fresh air, good food, and rest, cure tuberculosis; how bad air, overwork, and closed windows lead to it; and how the careless consumptive menaces the health of his family by spitting.

More Board Questions Answered.

Following up the subject of curious answers given by board examinees, we are herewith presenting a number of such answers. In the CIRCULAR for last month, page 151, appears the introductory article on this subject.

Pennsylvania.

Q. How, and why, is milk pasteurized?

A. Milk is pasteurized according to the pasteur institute by heating milk at a very high temperature with simply a pledget of cotton and access of air, but continuing this treatment on three consecutive days they claiming that in this time the germs and eggs which were layed before pasteurization began would have been hatched and would be killed by the continuous treatment, but if it is a question whether it isn't just as good to sterilization as sterilization usually kills if done properly and you might as well make an aquarium as a morgue of your stomach. [This is a good illustration of how good ideas may get mixed with bad, and go astray.]

A. By treating the cows with the same kind of food all the time because they want to be sure it is containing the same constituents.

Q. How are medicated waters made?

A. They are made by distillation, solution, decantation and sublimation.

A. Lead water is made by distillation.

Q. Why are the words "corrosivum," "mite," "flavum," "rubrum" used in the official titles of mercurial salts instead of the chemical names?

A. On account that the chemical names of the two chlorides is the same, and the same of the two oxides.

Q. How is mercuric iodide made?

A. By reaction between nitric acid and corrosive sublimate.

A. By rubbing together mercury oxid. flav. chloride, iodine and potassium iodide.

Q. Give the botanical name of yellow jessamine?

A. Hydrates canadensis.

A. Lobelia inflata.

A. Vibernum opulus.

A. Pilocarpus jub.

A. Cinchona bark.

A. Dativa stramonium.

A. Sarsaparilla.

Q. Give the Latin official title for oil of camphor.

A. Oil of camphor.

A. Camphorated oil.

A. Lin. camph.

A. Oleum camphoratum.

Q. Name the constituents of cow's milk.

A. Yeast, tartaric acid, etc.

Alabama.

Q. What is specific gravity? State how you would obtain the specific gravity of a liquid. Of a solid.

A. I don't know much about specific gravity, but think it has something to do with weighing. You would get the specific gravity of a solid by weighing it in the air and put it in water and measure the amount of the water with a barometer.

Q. How is glycerin obtained?

A. By getting calves and boiling them down.

Q. What is chemistry?

A. Chemistry is that branch of science which treats of the change which takes place on the outside of a molecule.

Q. Why is oxygen the most important of all the elements?

A. Because it is our life; something druggists get too little of. [This man ought to have passed on this answer alone.]

Iowa.

Q. What is the common synonym and principal medical use of linimentum calcis?

A. Synonym is opaldilcock and medicine properties ant acid.

[The following answers were recently given by a doctor of seven or eight years' practice, and thirty-five years of age, in an examination in pharmacy:]

A. Male fern, is aspidium, is a diuretic.

A. Colocynth is obtained from colocynt citridula seed, is a diuretic and poison.

A. Ichthyol is obtained from the head of the sperm whale.

A. Sparteine sulphate is obtained from the root and rhizome, is a cathartic.

A. Opium is a narcotic and contains 1½% of morphine.

A. Tulley's powder is co. chalk powder.

District of Columbia.

[In reply to our request for data for use in this article, the examiner on practical pharmacy wrote that the nature of his work was such that he could not give us questions and answers, but from his letter we cull the material given below.]

I have had applicants when directed to prepare the official glycerite of starch to stir the starch in a mortar with the water add the the glycerin and dispense same in a bottle as a shake mixture.

The carelessness of applicants as to cleanness often is overlooked so that pills, powders, suppositories, emulsions and almost all preparations that should be white when completed look as though they had been made in a dirty vessel or on the floor.

Prescriptions containing substances that produce a chemical reaction are often overlooked until too late, with the result that half of the prescription will be lost if the said reaction results in producing a gas, as in Basham's mixture, or making a solution of sodium salicylate by neutralizing the acid with sodium bicarbonate.

On one occasion I discovered an applicant when making a pill mass desiring to clean his spatula, rub the same vigorously on the sole of his shoe and use it without even wiping it, much less washing it. Certainly this can not be considered sanitary pharmacy and the applicant received no credit whatever for the work he did on this prescription. The same carelessness was characteristic of all his work, consequently the result was failure.

I find that a large majority of applicants have no conception of the proper manner of using delicate balances, but throw the material on the balance as they would weigh potatoes, spilling as much over the balance case as they have on the pan. The weights they throw around promiscuously and care nothing about dropping them on the floor and leaving them there.

On one occasion fifteen applicants lost more material on the balances, desk and floor than they consumed in filling the prescriptions. Fortunately, for them, they did not have to pay the bill for the same, and, for us, the material was not expensive.

I have had applicants give a demonstration of official process for percolation by macerating the drug for two hours in a closed vessel, packing the percolator and pouring on the menstruum, and stopping the same as soon as it had passed through the drug. In a large majority of cases the material was spoiled and the resulting tincture, if it had been completed, would have been worthless as it would not have represented the active constituents of the drug.

After considerable experience in examining applicants I have come to the conclusion that the trouble with many of them is that instead of being natural and doing the work set out for them as they would where they are employed they want to give an exhibition of their knowledge, with the result they do some very foolish things.

A board member, whose State it would perhaps be just as well not to mention here, writes:

I have been on the board so short a time that I have not seen very much as yet. The most striking defect I have observed is that candidates do not read the questions; they merely glance over the questions instead of carefully reading them. I find this to be the trouble in three-quarters of the cases. I used to think that the large majority were not fit to come before the board, but since I have been on the board I am so discouraged with the quality and lack of education of the candidates that I tremble for the future unless the educational requirements are raised. It appears to me that they do not realize the responsibility of their position. It does not in the least seem to hurt their pride if they do fail. "I'll try again," is what we hear, and some of them try five or six times.

We repeat our invitation of last month to all board members and former board members to contribute curious answers for publication here, as by studying such answers we can learn a good deal about what the candidates need, and also get ideas as to clarifying the language of some of the questions.

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

Has the Drug Clerk a Chance?

New York, February 17th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Much as has been said concerning the condition of the drug-clerk, hardly any of your correspondents touched the right key in their discussions. So I take the liberty to add my mite towards this interesting but seemingly unsolvable subject.

Why do drug clerks compare themselves to car conductors, bricklayers, plumbers and the like? In their letters to you they invariably quote working hours and wages of these men for comparison. This is a fallacy and illogical. The compeers of the drug clerk are not any of the above, but obviously men of some education and followers of "semi-professions" or professions.

In making comparisons why don't they or you take civil engineers, dentists or public accountants for examples? I know why you fail to enlighten us on the subject, and I do not blame you for failing to do so. For if you would publicly uphold our contentions (I am almost sure you do privately) you would lose many a penny. However, to come back to where we started from. The above-named vocations are similar in many points to ours, and by comparing remunerations you will find that civil engineers receive \$3.50 per day for eight hours' work, dentists get on an average \$25 per week, for eight hours a day, with alternate Sundays and holidays, while public accountants do not work for less than \$22 a week, of five days of eight hours each, and one of four hours. In none of these professions is as big a capital needed for launching in business as in ours. Two of them can be learned at night, and therefore while the student is earning a salary (one of the greatest inducements pharmacy has to offer); the third one, dentistry, is the only one requiring four years of study, but is on that account of a higher level than pharmacy.

This information is correct, having received same from friends who follow these vocations. Now tell us frankly, why should a drug clerk work for \$20 a week, of six days of twelve hours each, not mentioning anything about the holidays and Sundays which usually the boss takes himself, and about the menial work he has to do not only as an apprentice and junior, but usually as a registered man, too?

You contend that the good clerk has opportunities of advancement. Pray to what? What position is there above clerkship in the average store? The big stores, though they may loom large on the horizon, are yet small in number compared to the many 2 by 2 corner stores, where most of the clerks find employment, and therefore the chances of managerships are proportionately small.

I am an ex drug clerk, and with modest pride may say that I was a good one, or otherwise my boss would not have called me back after an absence of six months, and another druggist would not have offered me a position with quite a high salary six times,

which I just as often refused. Under these conditions I view the situation without bias, and quite agree with Mr. P. C. Wray (who, by the way, was a classmate of mine at the New York College), that the drug business is not the worst by any means, and usually looks better after some time "off." But that "time off" is hard to get, and will be so, until the influence-having journals, of which you are the foremost, will help us in our efforts to that end.

But time will help and I am sure you will, too.

VERITAS.

[If we wrote a letter to a subscriber calling him a crook, would he paste it to the under side of the glass of his show case so that all his customers could read it? We think not. Yet here is a correspondent who writes that we are actuated by mercenary motives to act unjustly toward a large class of our friends and subscribers, and we are publishing what he says. His charge falls by the weight of its own ridiculousness. Just what he means by the language he uses, no one can say, but he seems to be blaming us for allowing correspondents to make certain comparisons in our columns, instead of compelling them to make others more to his liking. Why a few drug clerks here and there break out now and then with a complaint that their class are the downtrodden of the earth, and that their employers and the journals and the balance of the world are in league to prevent them from ever having a show, passes the comprehension of the ordinary thinking, reasoning mortal.

If there is such a league it fails to be effective in many cases, for perhaps over 99 per cent. of the successful proprietors of to-day were drug clerks who could not be kept down. And that is not because conditions were better for the clerk (from the clerk's point of view) years ago than they are now. In the old-time apprentice days no such salaries as those paid these times were ever heard of. About all the younger fellows got was their board and clothes and a lot of mighty valuable training and experience, while the older ones did not fare a great deal better. In many cases the office of the apprentice was in the cellar, and his work consisted of powdering drugs, wrestling with barrels of linseed oil, kerosene, and spirit of turpentine, and doing other work that is too "menial" for the present-day high school lad whose father has a good position but (what some old-time people seem to think) the wrong idea of bringing up a boy to be a manly, independent man. In the morning before the old-style drug store apprentice began his day's work he had to sweep the store, fill and clean the kerosene lamps, polish the show cases, wash the windows, scour the shelves, rub the shop bottles, put coal on the furnace, and do a few more chores. But all this could not keep them down. From this old school of clerks graduated such men as Frederick Stearns, William R. Warner, A. P. Sharp, Louis Dohme, John Wyeth, D. C. Robbins, Eli Lilly, Gerhard Mennen, Robert W. Johnson, L. T. Lazell, W. J. M. Gordon, Dundas Dick, and Theodore Metcalf, among the dead, and hundreds of well-known successful wholesalers, manufacturers, teachers, authors and others, not to mention the retailers again, or our good friends, the doctors, among the living. And in the present-day school there are clerks training to occupy positions of equal prominence in the drug world of the coming generation. Of course, not all drug

looking about for competent authorities for the physiologic examination of the preparations of digitalis and strophanthus. I first decided to assign these to some pharmacologist in New York. However, on second consideration, I decided that it would be better to have this work done by Prof. Vanderkleed, whose recent lectures in this city impressed me very much, also since your firm has been pioneers in this line. This work was done for me as a personal favor and paid for. The report was handed in by me with no name attached, that of the firm was carefully omitted. The use of your name was not authorized by me nor did I have any knowledge of whose samples were being examined. All of the prescriptions examined were known only by numbers, hence partiality was shown no one.

Very truly yours,
V. Coblentz.

Dr. Vanderkleed did not know that this was for publication.

Some action taken on this matter by a meeting of druggists held March 23d is reported in another column.

To a representative of the CIRCULAR Mr. Mulford said: "Sensational methods are not favorably regarded by our house, and we believe that the greatest permanent good in the investigations of pharmaceutical conditions can be accomplished by pharmaceutical authorities acting under proper municipal, State or national control. Our efforts have been and consistently will be made in doing what we can to improve pharmaceutical conditions, as we recognize that whatever improves conditions for our patrons or for legitimate pharmacy, adds credit to those engaged in the occupation."

New York Druggists Affiliate for Protection.

Representatives of ten of the pharmacal organizations of this city, constituting a conference committee on matters of laws and pharmacal regulation held a well-attended meeting March 23d. When the assemblage had been duly convened Dr. William Muir, of Brooklyn, who acted as chairman told briefly of the work the committee had done and called attention to the fact that the board of health's anti-opiate ordinance (see last month's CIRCULAR, page 164) had again been amended by striking out the words "Any such prescription shall not be refilled." A motion prevailed to continue the conference committee; its permanency seems assured.

Resolutions voicing the thanks of the drug trade to the board of health were offered by C. O. Bigelow and passed. A copy of the resolutions will be sent to Dr. Lederle, the health commissioner.

C. A. Mayo was elected secretary and treasurer of the conference committee. A communication was sent to the several associations asking for a donation of \$5 to defray the incidental expenses of the committee.

A discussion arose concerning the recently displayed activity of the New York *World* in matters pharmacal (see above). Dr. G. C. Diekman in explaining the origin of the investigations said that a physician was reported to have informed a man closely connected with the newspaper that the demise of one of his patients had been hastened, if not altogether caused, by the dispensing by a pharmacist of tincture of strophanthus (or digitalis—the speaker was not certain) that was therapeutically far from what a satisfactory preparation should be.

Dr. Diekman explained that the physiological testing of the preparations collected by the representatives of the newspaper had been done by the H. K. Mulford Company in ignorance of the purpose of the examination (see above). In this connection the speaker pointed out that druggists as a rule did not manufacture their own preparations of digitalis and strophanthus and that no standards were set for them in the United States Pharmacopoeia.

Peter Diamond was of the opinion that the matter should be let alone by druggists generally as it would work no hardship on those who were honest.

Dr. Diekman said that he had been asked to have the New York Board of Pharmacy co-operate in applying the pharmacy law in connection with the disclosures of the investigation, and he had agreed to do so. He asked for the opinions of others present, and his position was finally upheld, although for a time criticism of the board's proffering co-operation was rife.

C. O. Bigelow felt that the newspaper involved did not care what the honest druggist did, but was concerned only with punishing the guilty. He said that much of the dishonesty charged to the druggists was caused by ruinous competition in the prices charged for prescriptions encouraged by "shoppers."

S. V. B. Swann said that, meeting a number of druggists daily, he heard many statements to the effect that the

board of pharmacy was lax in the performance of its duties. He did not believe this to be true, but thought that the feeling existing was one of dissatisfaction.

Mr. Bigelow defended the board, which he said was conducting two hearings a month, having had six hearings with an average of eight accused persons at each hearing. Half the cases, he said, were settled at the headquarters of the board. Mr. Bigelow stated that more inspectors would be had shortly in this district.

Prof. W. C. Anderson had the impression that the newspaper investigation would help the board of pharmacy in its work. He regretted that anyone should get the impression that the board was not active.

Dr. Diekman referred to the fact that there was no board in existence from August until October last, and that it was not until February that the board could begin the active performance of its duties. He said that the board had been criticised for not revoking licenses and he pointed out the necessity of securing more than one conviction before a revocation was possible.

Otto Raubenheimer said that the board was handicapped in having no office in this city at present and also by a lack of funds to carry on the work.

The meeting was adjourned subject to the call of the chair.

Kings County Society.

At the regular monthly meeting of the Kings County Pharmaceutical Society, held March 14th, six names were added to the roll of members, and two additional applications for membership were received.

In the absence of the treasurer, Adrian Paradis, his report was read by Dr. William Muir. The balance to the credit of the society was reported to be \$381.63 and the report credited to the Brooklyn college \$11,742.66.

Following this report came a lengthy account of the doings in the legislative field of interest to pharmacists. Dr. Muir made this also, giving a synopsis of the different bills now pending in the State legislature. The committee favored the bill designed to prevent the sale of hypodermic syringes and needles, except upon the order of a physician or a veterinarian.

Another measure which sought to curtail the power of local authorities in relation to the regulation of pharmacy was discussed at length. The consensus of opinion seemed to be that to advocate such a law at this time would not be wise. Dr. Muir believed that the origin of legislative matters should be with the State association and not in local organizations as this measure was said to have originated. Otto Raubenheimer favored the bill, arguing that it was now time to act to preclude further board of health ordinances which would inflict hardships upon the druggist. A motion was carried after considerable discussion placing the society on record as maintaining a neutral position with regard to this bill.

It was suggested that the conference committee be empowered to investigate the traffic in cocaine and to confer with the police authorities if necessary in an endeavor to stop the unlawful sale of this drug. After considerable discussion a special committee of three was appointed to take up the matter.

Charles Heimerzheim reported a balance of \$39.25 remaining in the hands of the propaganda committee, and said that another supply of propagandic postal cards was ready for distribution.

Prof. W. C. Anderson told of a joint meeting of the doctors and druggists of Staten Island which had resulted in the formation of a local association to promote propagandic work and the furtherance of better relations between the representatives of the two professions.

Prof. Anderson also made a report concerning an interview with the authorities of the Brooklyn hospital alleged to have detracted the druggists in the matter of prescriptions (see last month's CIRCULAR, page 165). He said that he had been informed that prior to the establishment of the dispensary of the hospital, a certain druggist had filled most of the prescriptions and had endeavored to secure these prescriptions after the establishment of a dispensary. For this reason patients were being advised to patronize the dispensary. Prof. Anderson said that the hospital authorities had not taken thought of the reflection of their action upon pharmacists at large and would endeavor to have matters better adjusted.

Otto Raubenheimer, of the committee on pharmacy, in-

roduced Dr. J. L. Mayer, the speaker of the day, who presented a paper on "Milk Analysis." This paper appears in full on page 185 of this issue.

Owing to the lateness of the hour the paper was not discussed. The author was officially thanked by the society.

It was announced that the speaker for the April meeting would be Prof. Joseph Kahn, who would speak on "The Newer Synthetic Remedies."

New York German Apothecaries.

Following the opening duties of the meeting of the New York German Apothecaries' Society held March 2d, Emil Roller, chairman of the scientific committee, announced that at the meeting to be held April 6th, Dr. E. W. Ditrach would deliver a lecture on "Salvarsan." The social session discussed at the previous meeting he said would be held in the hall of the New York Turnverein April 13th or 20th.

Chairman O. P. Gilbert of the entertainment committee reported that the musical entertainment held February 23d had been in every way a gratifying success. So satisfactory was this affair that he favored holding similar ones in the future instead of the annual ball and dinner, as the musicals were equally enjoyable and far less expensive. Mr. Gilbert reported that the plans for the jubilee celebration in October were progressing rapidly. He announced that the summer outing would be held at College Point, Long Island, July 6th.

A synopsis of the pharmacal measures in the State legislature was given by S. V. B. Swann, chairman of the committee on legislation. He also told of the failure of the late Foster bill in congress and expressed the belief that a similar measure would be offered during the proposed special session of congress. Mr. Swann was of the opinion that there would be formed a joint legislative committee of the various local pharmacal organizations whose duty it would be to protect the pharmacists against any legislation on the part of legislators or local boards, which might be hurtful to the interests of the former. In the discussion following this report Otto Raubenheimer criticised that part of the anti-opiate ordinance which prohibited the refilling of prescriptions which contain more than a certain amount of opium, morphine, cocaine and their salts. [This provision has since been rescinded.] E. C. Goetting expressed satisfaction that the board of health had modified the ordinance. He felt convinced that the arguments which he had sent to Commissioner Lederle had been instrumental in causing the board to extend the restrictions to the patented derivatives of morphine and to permit the sale of certain official preparations.

Mr. Gilbert decried the alleged practice of some jobbers who sell drugs and medicines to the consumer at wholesale prices.

A motion to appropriate \$50 to the Hallberg memorial fund prevailed, but this action was reconsidered and the matter referred to the board of managers.

No scientific lecture had been provided for the meeting, and Mr. Roller introduced Albert Plaut who reviewed the legislative situation particularly with regard to the efforts to regulate the sale of narcotic drugs. Mr. Plaut considered the Foster bill an inadequate and burdensome measure and expressed pleasure at its failure. He favored an interstate anti-narcotic law, believing such a measure to be of real help.

Considerable discussion followed Mr. Plaut's address; and the society expressed its thanks to the speaker.

Instead of the annual reception and banquet the society this year enjoyed an evening of music, song and dancing. The delightful occasion was the evening of February 23d; the place, Terrace Garden. More than 300 persons were entertained with orchestral selections, vocal solos and groups, and laughable sketches. Messrs. Albert, Gilbert, Hirseman, Kantrowitz, Lehman, and Rieffelin of the committee on arrangements deserved the many expressions of appreciation voiced by those who shared the pleasure of the evening.

An inspector of the municipal department of health, of this city, caused the arrest recently of a druggist on Second avenue, who, the inspector alleged, had purchased about 325 ounces of cocaine during January and February of this year. The druggist claimed to have bought the drug for export purposes. He has been held for trial.

National Pharmaceutical Society.

An imposing array of speakers, an abundance of good things to refresh the inner man, and smoking material aplenty, greeted the many attending the "house-warming" of the National Pharmaceutical Society which occurred on the evening of February 20th, at the new club rooms, 2320 Eighth avenue, this city.

Dr. William Muir was the first speaker introduced. He compared the conditions in the pharmaceutical world at the present time with those of forty years ago; congratulated the society upon its growth and success and cautioned the members against the evils they should avoid. He also explained the recently amended anti-narcotic ordinance of the local board of health (see last month's CIRCULAR, page 164) and its advantages over the original ordinance to the retail druggist.

Dr. L. L. Roos of the local health board contributed to the program of the evening by criticising very openly the remarks of Dr. Muir relative to the regulation of the sale of opiates. He contended that the anti-narcotic ordinance should never have been changed from its original stringent form.

Prof. W. E. Anderson, who was the next speaker, took issue with Dr. Roos and the discussion was for a time quite warm.

Among the other speakers of the occasion were John R. Wall, Edward Schott, William E. Crews, Dr. G. C. Diekman, G. H. Hitchcock, C. A. Mayo, and H. S. Noël.

New York Chemists' Club in Its New Home.

The formal opening of the new quarters of the Chemists' Club of New York, in the Chemists' Building, 50 East Forty-first street, was appropriately celebrated March 17th to 19th.

The club was formed about twelve years ago and up to the present has occupied quarters in West Fifty-fifth street. The new building has been erected at a cost of about \$500,000 and it is believed to be the finest of its kind in the world. It combines the features of a first class club, including the restaurant and members' sleeping rooms, with finely equipped laboratories for analytical and consulting chemists and for research work. Other features are an auditorium and lecture room, and a large library and scientific museum.

Brooklyn Druggists Uphold Anti-Cocaine Crusade.

At a meeting of the conference committee of the pharmaceutical organizations of Kings county comprising Brooklyn and the contiguous towns held March 17th the following resolution was adopted:

Whereas, We have heard that in a report of a meeting in Brooklyn a speaker declared that it was current report that the anti-cocaine law was not being properly complied with in Greater New York; therefore be it

Resolved, That while we doubt the truth of this assertion we are anxious to put ourselves on record to assist the health officers in any way they may suggest in putting an end to any such illegal traffic as may be discovered or suspected.

A copy of this resolution was sent to the local department of health.

Long Island Drug Club.

Three new members were enrolled by the Long Island Drug Club, of Brooklyn, N. Y., at the meeting held February 20th.

Attention was given to the matter of a club house; and the directors were authorized to look for a suitable location and report at the March meeting.

At the conclusion of the business session there was an informal entertainment by several of the members, the contributions including declamations, vocal selections, and an exhibition of legerdemain.

Brooklyn Alumni Banquet.

Alumni, alumnae, members of the faculty, officers, and friends of the Brooklyn College of Pharmacy to the number of one hundred attended the annual reunion and banquet of the alumni association of the college, on March 2d. Dean W. C. Anderson was the toastmaster.

The principal speakers on the after-dinner program were Dr. A. S. Walsh, Dr. G. C. Diekman, Dr. William Muir, W. H. Weygand, president of the alumni, J. R. Wall, and C. H. Goddard.

looking about for competent authorities for the physiologic examination of the preparations of digitalis and strophanthus, I first decided to assign these to some pharmacologist in New York. However, on second consideration, I decided that it would be better to have this work done by Prof. Vanderkleed, whose recent lectures in this city impressed me very much, also since your firm has been pioneers in this line. This work was done for me as a personal favor and paid for. The report was handed in by me with no name attached, that of the firm was carefully omitted. The use of your name was not authorized by me nor did I have any knowledge of whose samples were being examined. All of the prescriptions examined were known only by numbers, hence partiality was shown no one.

Very truly yours,
V. Coblentz.

Dr. Vanderkleed did not know that this was for publication.

Some action taken on this matter by a meeting of druggists held March 23d is reported in another column.

To a representative of the CIRCULAR Mr. Mulford said: "Sensational methods are not favorably regarded by our house, and we believe that the greatest permanent good in the investigations of pharmaceutical conditions can be accomplished by pharmaceutical authorities acting under proper municipal, State or national control. Our efforts have been and consistently will be made in doing what we can to improve pharmaceutical conditions, as we recognize that whatever improves conditions for our patrons or for legitimate pharmacy, adds credit to those engaged in the occupation."

New York Druggists Affiliate for Protection.

Representatives of ten of the pharmacal organizations of this city, constituting a conference committee on matters of laws and pharmacal regulation held a well-attended meeting March 23d. When the assemblage had been duly convened Dr. William Muir, of Brooklyn, who acted as chairman told briefly of the work the committee had done and called attention to the fact that the board of health's anti-opiate ordinance (see last month's CIRCULAR, page 164) had again been amended by striking out the words "Any such prescription shall not be refilled." A motion prevailed to continue the conference committee; its permanency seems assured.

Resolutions voicing the thanks of the drug trade to the board of health were offered by C. O. Bigelow and passed. A copy of the resolutions will be sent to Dr. Lederle, the health commissioner.

C. A. Mayo was elected secretary and treasurer of the conference committee. A communication was sent to the several associations asking for a donation of \$5 to defray the incidental expenses of the committee.

A discussion arose concerning the recently displayed activity of the New York World in matters pharmacal (see above). Dr. G. C. Diekman in explaining the origin of the investigations said that a physician was reported to have informed a man closely connected with the newspaper that the demise of one of his patients had been hastened, if not altogether caused, by the dispensing by a pharmacist of tincture of strophanthus (or digitalis—the speaker was not certain) that was therapeutically far from what a satisfactory preparation should be.

Dr. Diekman explained that the physiological testing of the preparations collected by the representatives of the newspaper had been done by the H. K. Mulford Company in ignorance of the purpose of the examination (see above). In this connection the speaker pointed out that druggists as a rule did not manufacture their own preparations of digitalis and strophanthus and that no standards were set for them in the United States Pharmacopœia.

Peter Diamond was of the opinion that the matter should be let alone by druggists generally as it would work no hardship on those who were honest.

Dr. Diekman said that he had been asked to have the New York Board of Pharmacy co-operate in applying the pharmacy law in connection with the disclosures of the investigation, and he had agreed to do so. He asked for the opinions of others present, and his position was finally upheld, although for a time criticism of the board's proferring co-operation was rife.

C. O. Bigelow felt that the newspaper involved did not care what the honest druggist did, but was concerned only with punishing the guilty. He said that much of the dishonesty charged to the druggists was caused by ruinous competition in the prices charged for prescriptions encouraged by "shoppers."

S. V. B. Swann said that, meeting a number of druggists daily, he heard many statements to the effect that the

board of pharmacy was lax in the performance of its duties. He did not believe this to be true, but thought that the feeling existing was one of dissatisfaction.

Mr. Bigelow defended the board, which he said was conducting two hearings a month, having had six hearings with an average of eight accused persons at each hearing. Half the cases, he said, were settled at the headquarters of the board. Mr. Bigelow stated that more inspectors would be had shortly in this district.

Prof. W. C. Anderson had the impression that the newspaper investigation would help the board of pharmacy in its work. He regretted that anyone should get the impression that the board was not active.

Dr. Diekman referred to the fact that there was no board in existence from August until October last, and that it was not until February that the board could begin the active performance of its duties. He said that the board had been criticised for not revoking licenses and he pointed out the necessity of securing more than one conviction before a revocation was possible.

Otto Raubenheimer said that the board was handicapped in having no office in this city at present and also by a lack of funds to carry on the work.

The meeting was adjourned subject to the call of the chair.

Kings County Society.

At the regular monthly meeting of the Kings County Pharmaceutical Society, held March 14th, six names were added to the roll of members, and two additional applications for membership were received.

In the absence of the treasurer, Adrian Paradis, his report was read by Dr. William Muir. The balance to the credit of the society was reported to be \$381.63 and the report credited to the Brooklyn college \$11,742.66.

Following this report came a lengthy account of the doings in the legislative field of interest to pharmacists. Dr. Muir made this also, giving a synopsis of the different bills now pending in the State legislature. The committee favored the bill designed to prevent the sale of hypodermic syringes and needles, except upon the order of a physician or a veterinarian.

Another measure which sought to curtail the power of local authorities in relation to the regulation of pharmacy was discussed at length. The consensus of opinion seemed to be that to advocate such a law at this time would not be wise. Dr. Muir believed that the origin of legislative matters should be with the State association and not in local organizations as this measure was said to have originated. Otto Raubenheimer favored the bill, arguing that it was now time to act to preclude further board of health ordinances which would inflict hardships upon the druggist. A motion was carried after considerable discussion placing the society on record as maintaining a neutral position with regard to this bill.

It was suggested that the conference committee be empowered to investigate the traffic in cocaine and to confer with the police authorities if necessary in an endeavor to stop the unlawful sale of this drug. After considerable discussion a special committee of three was appointed to take up the matter.

Charles Heimerzheim reported a balance of \$39.25 remaining in the hands of the propaganda committee, and said that another supply of propagandic postal cards was ready for distribution.

Prof. W. C. Anderson told of a joint meeting of the doctors and druggists of Staten Island which had resulted in the formation of a local association to promote propagandic work and the furtherance of better relations between the representatives of the two professions.

Prof. Anderson also made a report concerning an interview with the authorities of the Brooklyn hospital alleged to have detracted the druggists in the matter of prescriptions (see last month's CIRCULAR, page 165). He said that he had been informed that prior to the establishment of the dispensary of the hospital, a certain druggist had filled most of the prescriptions and had endeavored to secure these prescriptions after the establishment of a dispensary. For this reason patients were being advised to patronize the dispensary. Prof. Anderson said that the hospital authorities had not taken thought of the reflection of their action upon pharmacists at large and would endeavor to have matters better adjusted.

Otto Raubenheimer, of the committee on pharmacy, in-

troduced Dr. J. L. Mayer, the speaker of the day, who presented a paper on "Milk Analysis." This paper appears in full on page 185 of this issue.

Owing to the lateness of the hour the paper was not discussed. The author was officially thanked by the society.

It was announced that the speaker for the April meeting would be Prof. Joseph Kahn, who would speak on "The Newer Synthetic Remedies."

New York German Apothecaries.

Following the opening duties of the meeting of the New York German Apothecaries' Society held March 2d, Emil Roller, chairman of the scientific committee, announced that at the meeting to be held April 6th, Dr. E. W. Dietrich would deliver a lecture on "Salvarsan." The social session discussed at the previous meeting he said would be held in the hall of the New York Turnverein April 13th or 20th.

Chairman O. P. Gilbert of the entertainment committee reported that the musical entertainment held February 23d had been in every way a gratifying success. So satisfactory was this affair that he favored holding similar ones in the future instead of the annual ball and dinner, as the musicals were equally enjoyable and far less expensive. Mr. Gilbert reported that the plans for the jubilee celebration in October were progressing rapidly. He announced that the summer outing would be held at College Point, Long Island, July 6th.

A synopsis of the pharmacal measures in the State legislature was given by S. V. B. Swann, chairman of the committee on legislation. He also told of the failure of the late Foster bill in congress and expressed the belief that a similar measure would be offered during the proposed special session of congress. Mr. Swann was of the opinion that there would be formed a joint legislative committee of the various local pharmacal organizations whose duty it would be to protect the pharmacists against any legislation on the part of legislators or local boards, which might be hurtful to the interests of the former. In the discussion following this report Otto Raubenheimer criticised that part of the anti-opiate ordinance which prohibited the refilling of prescriptions which contain more than a certain amount of opium, morphine, cocaine and their salts. [This provision has since been rescinded.] E. C. Goetting expressed satisfaction that the board of health had modified the ordinance. He felt convinced that the arguments which he had sent to Commissioner Lederle had been instrumental in causing the board to extend the restrictions to the patented derivatives of morphine and to permit the sale of certain official preparations.

Mr. Gilbert decried the alleged practice of some jobbers who sell drugs and medicines to the consumer at wholesale prices.

A motion to appropriate \$50 to the Hallberg memorial fund prevailed, but this action was reconsidered and the matter referred to the board of managers.

No scientific lecture had been provided for the meeting, and Mr. Roller introduced Albert Plaut who reviewed the legislative situation particularly with regard to the efforts to regulate the sale of narcotic drugs. Mr. Plaut considered the Foster bill an inadequate and burdensome measure and expressed pleasure at its failure. He favored an interstate anti-narcotic law, believing such a measure to be of real help.

Considerable discussion followed Mr. Plaut's address; and the society expressed its thanks to the speaker.

Instead of the annual reception and banquet the society this year enjoyed an evening of music, song and dancing. The delightful occasion was the evening of February 23d; the place, Terrace Garden. More than 300 persons were entertained with orchestral selections, vocal solos and groups, and laughable sketches. Messrs. Albert, Gilbert, Hirsman, Kantrowitz, Lehman, and Rieffelin of the committee on arrangements deserved the many expressions of appreciation voiced by those who shared the pleasure of the evening.

An inspector of the municipal department of health, of this city, caused the arrest recently of a druggist on Second avenue, who, the inspector alleged, had purchased about 325 ounces of cocaine during January and February of this year. The druggist claimed to have bought the drug for export purposes. He has been held for trial.

National Pharmaceutical Society.

An imposing array of speakers, an abundance of good things to refresh the inner man, and smoking material a-plenty, greeted the many attending the "house-warming" of the National Pharmaceutical Society which occurred on the evening of February 20th, at the new club rooms, 2320 Eighth avenue, this city.

Dr. William Muir was the first speaker introduced. He compared the conditions in the pharmaceutical world at the present time with those of forty years ago; congratulated the society upon its growth and success and cautioned the members against the evils they should avoid. He also explained the recently amended anti-narcotic ordinance of the local board of health (see last month's CIRCULAR, page 164) and its advantages over the original ordinance to the retail druggist.

Dr. L. L. Roos of the local health board contributed to the program of the evening by criticising very openly the remarks of Dr. Muir relative to the regulation of the sale of opiates. He contended that the anti-narcotic ordinance should never have been changed from its original stringent form.

Prof. W. E. Anderson, who was the next speaker, took issue with Dr. Roos and the discussion was for a time quite warm.

Among the other speakers of the occasion were John R. Wall, Edward Schott, William E. Crews, Dr. G. C. Diekmann, G. H. Hitchcock, C. A. Mayo, and H. S. Noël.

New York Chemists' Club in Its New Home.

The formal opening of the new quarters of the Chemists' Club of New York, in the Chemists' Building, 50 East Forty-first street, was appropriately celebrated March 17th to 19th.

The club was formed about twelve years ago and up to the present has occupied quarters in West Fifty-fifth street. The new building has been erected at a cost of about \$500,000 and it is believed to be the finest of its kind in the world. It combines the features of a first class club, including the restaurant and members' sleeping rooms, with finely equipped laboratories for analytical and consulting chemists and for research work. Other features are an auditorium and lecture room, and a large library and scientific museum.

Brooklyn Druggists Uphold Anti-Cocaine Crusade.

At a meeting of the conference committee of the pharmaceutical organizations of Kings county comprising Brooklyn and the contiguous towns held March 17th the following resolution was adopted:

Whereas, We have heard that in a report of a meeting in Brooklyn a speaker declared that it was current report that the anti-cocaine law was not being properly complied with in Greater New York; therefore be it

Resolved, That while we doubt the truth of this assertion we are anxious to put ourselves on record to assist the health officers in any way they may suggest in putting an end to any such illegal traffic as may be discovered or suspected.

A copy of this resolution was sent to the local department of health.

Long Island Drug Club.

Three new members were enrolled by the Long Island Drug Club, of Brooklyn, N. Y., at the meeting held February 20th.

Attention was given to the matter of a club house; and the directors were authorized to look for a suitable location and report at the March meeting.

At the conclusion of the business session there was an informal entertainment by several of the members, the contributions including declamations, vocal selections, and an exhibition of legerdemain.

Brooklyn Alumni Banquet.

Alumni, alumnae, members of the faculty, officers, and friends of the Brooklyn College of Pharmacy to the number of one hundred attended the annual reunion and banquet of the alumni association of the college, on March 2d. Dean W. C. Anderson was the toastmaster.

The principal speakers on the after-dinner program were Dr. A. S. Walsh, Dr. G. C. Diekmann, Dr. William Muir, W. H. Weygand, president of the alumni, J. R. Wall, and C. H. Goddard.

Pennsylvania's Proposed New Pharmacy Law.

One of the most voluminous bills ever considered by the Pennsylvania legislature is the measure designed to codify and make more stringent the laws of the State regulating the sale of drugs and the practice of pharmacy, introduced by Representative Hecht, of Philadelphia. The bill was prepared by S. L. Clements, attorney for the board of pharmacy, and has the approval of the pharmacal organizations of the State generally.

The bill provides for the establishment of "the Pennsylvania Drug Commission," composed of five of "the most skillful pharmacists in Pennsylvania who are not teachers or instructors in any college," who are to be appointed by the governor for five-year terms. From these members are to be elected a president, a secretary and a treasurer, the salary of the secretary, who is to be the executive officer, not to exceed \$3,000 per annum.

Should the bill become a law, proprietors of pharmacies and licensed stores must obtain annual licenses at a cost of \$1 each, and in each pharmacy there must be a copy of the Pharmacopoeia, of the National Formulary and, under certain conditions, of the American Homeopathic Pharmacopoeia.

The bill provides that examinations are to be held four times a year, applicants for license as pharmacists to have had five years' practical experience and be graduates of a recognized school of pharmacy. Assistant pharmacists are provided for. The New York law is copied with regard to the revocation of licenses, and to reciprocal licensure.

The anti-narcotic provisions of the bill are very stringent. Except in the case of preparations for external use and bona-fide medicinal preparations containing less than a stated amount, opium and its derivatives may be sold at retail only on prescriptions which are not to be refilled. Restrictions are also placed about the prescribing of narcotics and the illegal possession of these drugs is defined. Still more stringent are the restrictions relative to cocaine, its salts and analogues.

The character of the label for drugs of other than official strength is quite clearly set forth in the bill, which says that the label on such drugs must bear the statement "not of official strength." In other respects the misbranding features of the bill are similar to those of the federal food and drugs act.

This measure would repeal all other pharmacy laws at present on the statute books of the State.

The "patent medicine" bill of Representative E. H. Fahy, of Philadelphia, providing for the publication of the formula of proprietary medicines on the outside wrapper and label of the bottle, box or other container, has been so amended by its author as to provide that the act shall not apply to a registered druggist manufacturing his own specialties to be sold at retail from his own place of business.

One Million Dollars for the Philadelphia College of Pharmacy.

In order that the Philadelphia College of Pharmacy may erect and equip a suitable building to form one of a notable group of structures to be used for educational purposes, an alumnus of the college living in England has offered to donate \$1,000,000 to his alma mater. The city is constructing a new boulevard between the city hall and the Greene street entrance to Fairmount Park, and an effort will be made to induce a number of large educational institutions at present scattered throughout the city, to build along this thoroughfare on sites to be donated by the city. In discussing the matter Prof. Remington said:

"The present location of the college on Tenth street above Arch, although admirably suited for conditions ten years ago, has become surrounded by high business buildings and the fire risk has become immensely increased. The 15,000 books, constituting probably the most valuable collection of the kind in existence, are crowded into alcoves and shelves clear up to the ceiling of the library, and the overflow is stowed away in adjoining rooms until they too are nearly full.

"While there are many details to be worked out, we are up to the point where we have had plans prepared for a group of three buildings. One will be for administration purposes, another will be for the library, and the third for research work, all communicating. The cost will be not less than \$500,000, and it will take as much more to equip them. How long it will take to bring all the details to a satisfactory conclusion, it is impossible to say. Much de-

pends on the city and much upon our ability to raise the funds necessary for the cost and equipment of the building, but I expect in two, or possibly three, years to see the Philadelphia College of Pharmacy located out along the parkway on a site to be provided by the city between the city hall and Fairmount Park."

The name of the wealthy and generous alumnus has not been made public, but a number of those who have been wondering who he is recall the fact that Henry S. Wellcome, of Burroughs, Wellcome & Co., London, is a graduate of the college, and is reputed to have been very successful in the conduct of his business.

At a dinner given by Howard B. French, president of the college, to celebrate its ninetieth birthday, the members of the board of trustees, the faculty, the mayor of Philadelphia, heads of two sister colleges and several prominent representatives of the trade in Philadelphia, were present. On this occasion Mr. French, in the capacity of toastmaster, gave an interesting historical sketch of the college.

Mayor Reyburn emphasized the close relationship between the city's educational institutions and its general welfare, strongly advocating the centralizing of institutions of this class along the city's new boulevard so that they might derive all the benefits of close association, neighborly contact and ideal location.

Dr. J. W. Holland, dean of Jefferson Medical College, spoke of the close relation between pharmacy and medicine and mentioned some of the famous men in the sister professions who had attended both these venerable Philadelphia institutions. He referred to the fact that while Jefferson College was founded four years later than the Philadelphia College of Pharmacy, they graduated their first classes in the same year, 1826.

Brief addresses were also made by Henry F. Walton, president of the Medico-Chirurgical College, Prof. Joseph P. Remington, dean of the Philadelphia College of Pharmacy; Joseph L. Lemberger, of Lebanon, Pa., who succeeded the late Mahlon N. Kline as vice-president of the institution; Profs. Henry Kraemer, Samuel P. Sadtler and Frank X. Moerk.

Philadelphia Cocaine Pedler Sentenced to Jail.

Benjamin P. Ashmead, a United States drug inspector at the port of Philadelphia, has been convicted of selling cocaine illegally. The jury did not have to leave the box in order to agree upon a verdict.

After looking into the man's record and hearing pleas that sentence be suspended, Judge Carr sentenced him to serve a term of nine months in prison.

Ashmead is the inspector referred to by Christopher Koch in his statement before a congressional committee, reported in the CIRCULAR for February, page 71.

Pittsburg Anti-Cocaine Crusade.

The grand jury sitting at Pittsburg, Pa., in March, returned twenty-six indictments against druggists of that city charged by the Pennsylvania Board of Pharmacy with selling cocaine, as such or in nostrum "cures" of one sort or another. The city police officials are co-operating at every point with the pharmacy authorities and it is believed that the illegal sale of the drug will soon be effectually stamped out.

E. E. Szatmary, of Duquesne, who plead guilty to a charge of illegally selling cocaine was sentenced March 17th, to serve sixty days in jail.

Interprofession Fraternizing in Western Pennsylvania.

The druggists of Meadville, Pa., had as their guests at their annual banquet held March 8th, the matrons of the hospitals of the city and the members of the local medical society. Sociability was the entire motive. The address of the evening was by Dr. C. P. Woodring on "Impressions of Pharmacy and Medicine Abroad."

Wiley-Kelton Nuptials.

Dr. Harvey W. Wiley, chief of the bureau of chemistry, of the United States department of agriculture, and Miss Anna Campbell Kelton, an assistant in the library of congress, were married February 27th, at the home of the bride's mother in Washington.

News of the Pharmacy Boards.

List of Board Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

ALABAMA—May 15th, at Birmingham. E. P. Galt, Selma.

ARIZONA—April 12th, at Phoenix. A. G. Hulett, Phoenix.

ARKANSAS—May 8th, at Little Rock. J. F. Dowdy, Little Rock.

CALIFORNIA—April 12th, at San Francisco. Louis Zeh, San Francisco.

COLORADO—S. L. Bresler, Denver.

CONNECTICUT—June 6th, at Hartford. J. A. Levery, Bridgeport.

DELAWARE—Albert Dougherty, Wilmington.

DISTRICT OF COLUMBIA—April 13th and 14th, at Washington. S. L. Hilton, Washington.

FLORIDA—June 12th and 13th, at Tampa. D. W. Ramsaur, Palatka.

GEORGIA—C. D. Jordan, Monticello.

IDAHO—April 11th, at Idaho Falls. J. M. Starrh, Shoshone.

ILLINOIS—F. C. Dodds, Springfield.

INDIANA—April 11th and 12th, at Indianapolis. W. H. Ruder, Salem.

IOWA—June 6th, at Des Moines. E. J. Moore, Des Moines.

KANSAS—May 25th, at Topeka. W. E. Sherriff, Ellsworth.

KENTUCKY—April 11th and 12th, at Louisville. J. W. Gayle, Frankfort.

LOUISIANA—May 9th to 11th, at New Orleans. F. A. Earhart, New Orleans.

MAINE—April 12th and 13th, at Augusta. F. W. Bucknam, Skowhegan.

MARYLAND—April 12th and 13th, at Baltimore. Ephraim Bacon, Roland Park.

MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.

MICHIGAN—E. J. Rodgers, Port Huron.

MINNESOTA—April 18th, at Minneapolis. C. T. Heller, St. Paul.

MISSISSIPPI—October 3d, at Jackson. L. H. Wilkinson, Greenwood.

MISSOURI—April 10th, at Kansas City. C. E. Zinn, Kansas City.

MONTANA—April 12th, at Butte. T. M. Kehoe, Billings.

NEBRASKA—A. V. Pease, Fairbury.

NEVADA—May 3d, at Reno. R. L. Prouty, Tonopah.

NEW HAMPSHIRE—F. H. Wingate, Nashua.

NEW JERSEY—April 20th, at Trenton. H. A. Jorden, Bridgeton.

NEW MEXICO—April 10th and 11th, at Albuquerque. A. J. Fisher, Santa Fe.

NEW YORK—May 24th and 25th, at New York, Albany and Buffalo. W. L. Bradt, Albany.

NORTH CAROLINA—July 7th, at Morehead City. F. W. Hancock, Oxford.

NORTH DAKOTA—June 20th, at Fargo. W. S. Parker, Lisbon.

OHIO—June 20th to 23d, at Columbus. F. H. Frost, Columbus.

OKLAHOMA—April 11th and 12th, at Oklahoma City. J. C. Burton, Stroud.

OREGON—C. G. Huntley, Oregon City.

PENNSYLVANIA—June 8th and 9th, at Pittsburg and Philadelphia. L. L. Walton, Williamsport.

RHODE ISLAND—May 2d, at Providence. J. E. Brennan, Pawtucket.

SOUTH CAROLINA—F. M. Smith, Charleston.

SOUTH DAKOTA—July 12th, at Lead. E. C. Bent, Dell Rapids.

TENNESSEE—April 18th, at Memphis. I. B. Clark, Nashville.

TEXAS—May 16th, at San Antonio. R. H. Walker, Gonzales.

UTAH—April 18th and 19th, at Salt Lake City. W. H. Dayton, Salt Lake.

VERMONT—D. F. Davis, Barre.

VIRGINIA—April 25th, at Richmond. T. A. Miller, Richmond.

WASHINGTON—P. Jensen, Tacoma.

WEST VIRGINIA—May 5th and 6th, at Wheeling. A. Walker, Sutton.

WISCONSIN—April 11th and 12th, at Madison. Edward Williams, Madison.

WYOMING—C. B. Gunnell, Evanston.

Alabama Board.

At a meeting of the Alabama Board of Pharmacy held at Montgomery in February the following were successful in the examination for applicants for registration:

As pharmacists—B. R. Bell, of Atlanta, Ga.; B. F. Beveny, of Littleton; C. W. Bradford, of Atlanta, Ga.; M. F. Claudy, of Birmingham; J. H. Collier, of Montgomery; S. A. Cruce, of Birmingham; J. A. Eaves, of Atlanta, Ga.; G. L. Giles, of Live Oak, Fla.; J. J. Hendricks, of Talladega; O. E. Jordan and T. H. Lauder, both of Atlanta, Ga.; M. A. McWilliams, of Auburn; J. J. Mooring, of Atlanta, Ga.; B. F. Moseley, of Auburn; T. F. Neighbors, of Goodwaters; J. J. Rams, of Atlanta, Ga.; J. V. Ward, of Birmingham; M. O. Williams, of Atlanta, Ga.; G. W. Wills, of Madisonville, Tenn.; and W. B. Wisdom and C. A. Wornock, both of Atlanta, Ga.

As assistants—C. T. Beacham, of Dexter, Ga.; C. L. Berk, of Ensley; W. H. Hoover, of Jasper; L. A. Faircloth, of Swansboro, Ga.; R. W. Payne, of Macon, Ga.; and W. H. Traylor, of Montgomery.

The next meeting of the board will be held May 15th, at Birmingham.

California Board.

In the report of the California Board of Pharmacy to Governor Gillett it is shown that during 1910 fifty-two arrests were made for alleged violations of the pharmacy law, forty-two of which resulted in conviction. One hundred and eighty-four persons were arrested for selling poisons without a prescription from a physician. These arrests resulted in 121 convictions, 36 compromises, 13 dismissals and 5 postponements of judgment.

Florida Board.

Out of fifteen applicants for registration examined by the Florida Board of Pharmacy at a meeting held January 23d and 24th, at St. Augustine, the following five persons were successful:

Louis Bas, of Orlando; George Bickings, of Palm Beach; J. C. Johnston, of Jasper; J. C. Matthews, of Jacksonville; and K. G. Oglesby, of Bartow.

The board amended its by-laws so as to require a minimum passing mark of 50 per cent., in any one subject. The issuing of temporary certificates was authorized.

The next meeting of the board will be held at Tampa, June 12th and 13th.

This being the annual meeting an election of officers occurred. The retiring officers were re-elected as follows: President, E. Berger, of Tampa; vice-president, Leon Hale, of Tampa; and secretary and treasurer, D. W. Ramsaur, of Palatka.

Kansas Board.

One hundred and fifty-five merchants' licenses were granted by the Kansas Board of Pharmacy during the quarter ending February 15th; four pharmacists were registered; to one person a temporary certificate was given, and four received duplicate certificates.

At the meeting held on the above date at Wichita the following graduates of recognized schools of pharmacy were registered without examination:

J. Gerkens, of Lawrence; E. R. Hess, of Ottawa; S. N. Nite, of Topeka; and Walter Sledd, of Sterling.

There were sixty-nine applicants to be examined for registration; of this number the following twenty-nine were successful:

I. R. Aber, of Mound Valley; H. P. Craft, of Wichita; L. H. Combs, of Herrington; B. H. Crocker, of Hoisington; H. C. Deatz, of Hutchinson; J. G. Durham, of Douglass; Margaret Dykes, of Wichita; W. A. Fish, of Humboldt; J. A. Follick, of Minneola; W. L. Johnson, of Newton; W. J. Laird, of Wichita; E. McLaughlin, of Kansas City; C. O. Morris, of Valley Center; Miss Lee D. Mulvaney, of Kansas City; B. R. Murphy, of Meade; T. E. Payne, of Kansas City; J. H. Pinney, of Dorrance; M. S. Poorman, of Arlington; R. W. Quackenbush, of Wichita; A. T. Richardson, of Topeka; F. H. Ricketts, of Springhill; R. I. Roby, of Stafford; F. Shoemaker, of Fort Scott; A. E. Soiseth, of Turner; Harry Venning, of Allen; Lillian A. West, of Kansas City; R. H. Williams, of Winfield; and A. W. Wilson and H. R. Wilson, both of Carney.

The next meeting will be held May 25th, at Topeka.

Pennsylvania's Proposed New Pharmacy Law.

One of the most voluminous bills ever considered by the Pennsylvania legislature is the measure designed to codify and make more stringent the laws of the State regulating the sale of drugs and the practice of pharmacy, introduced by Representative Hecht, of Philadelphia. The bill was prepared by S. L. Clements, attorney for the board of pharmacy, and has the approval of the pharmacal organizations of the State generally.

The bill provides for the establishment of "the Pennsylvania Drug Commission," composed of five of "the most skillful pharmacists in Pennsylvania who are not teachers or instructors in any college," who are to be appointed by the governor for five-year terms. From these members are to be elected a president, a secretary and a treasurer, the salary of the secretary, who is to be the executive officer, not to exceed \$3,000 per annum.

Should the bill become a law, proprietors of pharmacies and licensed stores must obtain annual licenses at a cost of \$1 each, and in each pharmacy there must be a copy of the Pharmacopoeia, of the National Formulary and, under certain conditions, of the American Homeopathic Pharmacopoeia.

The bill provides that examinations are to be held four times a year, applicants for license as pharmacists to have had five years' practical experience and be graduates of a recognized school of pharmacy. Assistant pharmacists are provided for. The New York law is copied with regard to the revocation of licenses, and to reciprocal licensure.

The anti-narcotic provisions of the bill are very stringent. Except in the case of preparations for external use and bona-fide medicinal preparations containing less than a stated amount, opium and its derivatives may be sold at retail only on prescriptions which are not to be refilled. Restrictions are also placed about the prescribing of narcotics and the illegal possession of these drugs is defined. Still more stringent are the restrictions relative to cocaine, its salts and analogues.

The character of the label for drugs of other than official strength is quite clearly set forth in the bill, which says that the label on such drugs must bear the statement "not of official strength." In other respects the misbranding features of the bill are similar to those of the federal food and drugs act.

This measure would repeal all other pharmacy laws at present on the statute books of the State.

The "patent medicine" bill of Representative E. H. Fahy, of Philadelphia, providing for the publication of the formula of proprietary medicines on the outside wrapper and label of the bottle, box or other container, has been so amended by its author as to provide that the act shall not apply to a registered druggist manufacturing his own specialties to be sold at retail from his own place of business.

One Million Dollars for the Philadelphia College of Pharmacy.

In order that the Philadelphia College of Pharmacy may erect and equip a suitable building to form one of a notable group of structures to be used for educational purposes, an alumnus of the college living in England has offered to donate \$1,000,000 to his alma mater. The city is constructing a new boulevard between the city hall and the Greene street entrance to Fairmount Park, and an effort will be made to induce a number of large educational institutions at present scattered throughout the city, to build along this thoroughfare on sites to be donated by the city. In discussing the matter Prof. Remington said:

"The present location of the college on Tenth street above Arch, although admirably suited for conditions ten years ago, has become surrounded by high business buildings and the fire risk has become immensely increased. The 15,000 books, constituting probably the most valuable collection of the kind in existence, are crowded into alcoves and shelves clear up to the ceiling of the library, and the overflow is stowed away in adjoining rooms until they too are nearly full.

"While there are many details to be worked out, we are up to the point where we have had plans prepared for a group of three buildings. One will be for administration purposes, another will be for the library, and the third for research work, all communicating. The cost will be not less than \$500,000, and it will take as much more to equip them. How long it will take to bring all the details to a satisfactory conclusion, it is impossible to say. Much de-

pends on the city and much upon our ability to raise the funds necessary for the cost and equipment of the building, but I expect in two, or possibly three, years to see the Philadelphia College of Pharmacy located out along the parkway on a site to be provided by the city between the city hall and Fairmount Park."

The name of the wealthy and generous alumnus has not been made public, but a number of those who have been wondering who he is recall the fact that Henry S. Wellcome, of Burroughs, Wellcome & Co., London, is a graduate of the college, and is reputed to have been very successful in the conduct of his business.

At a dinner given by Howard B. French, president of the college, to celebrate its ninetieth birthday, the members of the board of trustees, the faculty, the mayor of Philadelphia, heads of two sister colleges and several prominent representatives of the trade in Philadelphia, were present. On this occasion Mr. French, in the capacity of toastmaster, gave an interesting historical sketch of the college.

Mayor Reyburn emphasized the close relationship between the city's educational institutions and its general welfare, strongly advocating the centralizing of institutions of this class along the city's new boulevard so that they might derive all the benefits of close association, neighborly contact and ideal location.

Dr. J. W. Holland, dean of Jefferson Medical College, spoke of the close relation between pharmacy and medicine and mentioned some of the famous men in the sister professions who had attended both these venerable Philadelphia institutions. He referred to the fact that while Jefferson College was founded four years later than the Philadelphia College of Pharmacy, they graduated their first classes in the same year, 1826.

Brief addresses were also made by Henry F. Walton, president of the Medico-Chirurgical College, Prof. Joseph P. Remington, dean of the Philadelphia College of Pharmacy; Joseph L. Lemberger, of Lebanon, Pa., who succeeded the late Mahlon N. Kline as vice-president of the institution; Profs. Henry Kraemer, Samuel P. Sadtler and Frank X. Moerk.

Philadelphia Cocaine Pedler Sentenced to Jail.

Benjamin P. Ashmead, a United States drug inspector at the port of Philadelphia, has been convicted of selling cocaine illegally. The jury did not have to leave the box in order to agree upon a verdict.

After looking into the man's record and hearing pleas that sentence be suspended, Judge Carr sentenced him to serve a term of nine months in prison.

Ashmead is the inspector referred to by Christopher Koch in his statement before a congressional committee, reported in the CIRCULAR for February, page 71.

Pittsburg Anti-Cocaine Crusade.

The grand jury sitting at Pittsburg, Pa., in March, returned twenty-six indictments against druggists of that city charged by the Pennsylvania Board of Pharmacy with selling cocaine, as such or in nostrum "cures" of one sort or another. The city police officials are co-operating at every point with the pharmacy authorities and it is believed that the illegal sale of the drug will soon be effectually stamped out.

E. E. Szatmary, of Duquesne, who plead guilty to a charge of illegally selling cocaine was sentenced March 17th, to serve sixty days in jail.

Interprofession Fraternizing in Western Pennsylvania.

The druggists of Meadville, Pa., had as their guests at their annual banquet held March 8th, the matrons of the hospitals of the city and the members of the local medical society. Sociability was the entire motive. The address of the evening was by Dr. C. P. Woodring on "Impressions of Pharmacy and Medicine Abroad."

Wiley-Kelton Nuptials.

Dr. Harvey W. Wiley, chief of the bureau of chemistry, of the United States department of agriculture, and Miss Anna Campbell Kelton, an assistant in the library of congress, were married February 27th, at the home of the bride's mother in Washington.

News of the Pharmacy Boards.

List of Board Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

ALABAMA—May 15th, at Birmingham. E. P. Galt, Selma.
ARIZONA—April 12th, at Phoenix. A. G. Hulett, Phoenix.
ARKANSAS—May 8th, at Little Rock. J. F. Dowdy, Little Rock.
CALIFORNIA—April 12th, at San Francisco. Louis Zeh, San Francisco.
COLORADO—S. L. Bresler, Denver.
CONNECTICUT—June 6th, at Hartford. J. A. Levery, Bridgeport.
DELAWARE—Albert Dougherty, Wilmington.
DISTRICT OF COLUMBIA—April 13th and 14th, at Washington. S. L. Hilton, Washington.
FLORIDA—June 12th and 13th, at Tampa. D. W. Ramsaur, Palatka.
GEORGIA—C. D. Jordan, Monticello.
IDAHO—April 11th, at Idaho Falls. J. M. Starrh, Shoshone.
ILLINOIS—F. C. Dodds, Springfield.
INDIANA—April 11th and 12th, at Indianapolis. W. H. Ruder, Salem.
IOWA—June 6th, at Des Moines. E. J. Moore, Des Moines.
KANSAS—May 25th, at Topeka. W. E. Sherriff, Ellsworth.
KENTUCKY—April 11th and 12th, at Louisville. J. W. Gayle, Frankfort.
LOUISIANA—May 9th to 11th, at New Orleans. F. A. Earhart, New Orleans.
MAINE—April 12th and 13th, at Augusta. F. W. Bucknam, Skowhegan.
MARYLAND—April 12th and 13th, at Baltimore. Ephraim Bacon, Roland Park.
MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.
MICHIGAN—E. J. Rodgers, Port Huron.
MINNESOTA—April 18th, at Minneapolis. C. T. Heller, St. Paul.
MISSISSIPPI—October 3d, at Jackson. L. H. Wilkinson, Greenwood.
MISSOURI—April 10th, at Kansas City. C. E. Zinn, Kansas City.
MONTANA—April 12th, at Butte. T. M. Kehoe, Billings.
NEBRASKA—A. V. Pease, Fairbury.
NEVADA—May 3d, at Reno. R. L. Prouty, Tonopah.
NEW HAMPSHIRE—F. H. Wingate, Nashua.
NEW JERSEY—April 20th, at Trenton. H. A. Jorden, Bridgeton.
NEW MEXICO—April 10th and 11th, at Albuquerque. A. J. Fisher, Santa Fe.
NEW YORK—May 24th and 25th, at New York, Albany and Buffalo. W. L. Bradt, Albany.
NORTH CAROLINA—July 7th, at Morehead City. F. W. Hancock, Oxford.
NORTH DAKOTA—June 20th, at Fargo. W. S. Parker, Lisbon.
OHIO—June 20th to 23d, at Columbus. F. H. Frost, Columbus.
OKLAHOMA—April 11th and 12th, at Oklahoma City. J. C. Burton, Stroud.
OREGON—C. G. Huntley, Oregon City.
PENNSYLVANIA—June 8th and 9th, at Pittsburg and Philadelphia. L. L. Walton, Williamsport.
RHODE ISLAND—May 2d, at Providence. J. E. Brennan, Pawtucket.
SOUTH CAROLINA—F. M. Smith, Charleston.
SOUTH DAKOTA—July 12th, at Lead. E. C. Bent, Dell Rapids.
TENNESSEE—April 18th, at Memphis. I. B. Clark, Nashville.
TEXAS—May 16th, at San Antonio. R. H. Walker, Gonzales.
UTAH—April 18th and 19th, at Salt Lake City. W. H. Dayton, Salt Lake.
VERMONT—D. F. Davis, Barre.
VIRGINIA—April 25th, at Richmond. T. A. Miller, Richmond.
WASHINGTON—P. Jensen, Tacoma.
WEST VIRGINIA—May 5th and 6th, at Wheeling. A. Walker, Sutton.

WISCONSIN—April 11th and 12th, at Madison. Edward Williams, Madison.

WYOMING—C. B. Gunnell, Evanston.

Alabama Board.

At a meeting of the Alabama Board of Pharmacy held at Montgomery in February the following were successful in the examination for applicants for registration:

As pharmacists—B. R. Bell, of Atlanta, Ga.; B. F. Beveny, of Littleton; C. W. Bradford, of Atlanta, Ga.; M. F. Claudy, of Birmingham; J. H. Collier, of Montgomery; S. A. Cruce, of Birmingham; J. A. Eaves, of Atlanta, Ga.; G. L. Giles, of Live Oak, Fla.; J. J. Hendricks, of Talladega; O. E. Jordan and T. H. Lauder, both of Atlanta, Ga.; M. A. McWilliams, of Auburn; J. J. Mooring, of Atlanta, Ga.; B. F. Moseley, of Auburn; T. F. Neighbors, of Goodwaters; J. J. Rams, of Atlanta, Ga.; J. V. Ward, of Birmingham; M. O. Williams, of Atlanta, Ga.; G. W. Wills, of Madisonville, Tenn.; and W. B. Wisdom and C. A. Wornock, both of Atlanta, Ga.

As assistants—C. T. Beacham, of Dexter, Ga.; C. L. Berk, of Ensley; W. H. Hoover, of Jasper; L. A. Faircloth, of Swansboro, Ga.; R. W. Payne, of Macon, Ga.; and W. H. Traylor, of Montgomery.

The next meeting of the board will be held May 15th, at Birmingham.

California Board.

In the report of the California Board of Pharmacy to Governor Gillett it is shown that during 1910 fifty-two arrests were made for alleged violations of the pharmacy law, forty-two of which resulted in conviction. One hundred and eighty-four persons were arrested for selling poisons without a prescription from a physician. These arrests resulted in 121 convictions, 36 compromises, 13 dismissals and 5 postponements of judgment.

Florida Board.

Out of fifteen applicants for registration examined by the Florida Board of Pharmacy at a meeting held January 23d and 24th, at St. Augustine, the following five persons were successful:

Louis Bas, of Orlando; George Bickings, of Palm Beach; J. C. Johnston, of Jasper; J. C. Matthews, of Jacksonville; and K. G. Oglesby, of Bartow.

The board amended its by-laws so as to require a minimum passing mark of 50 per cent., in any one subject. The issuing of temporary certificates was authorized.

The next meeting of the board will be held at Tampa, June 12th and 13th.

This being the annual meeting an election of officers occurred. The retiring officers were re-elected as follows: President, E. Berger, of Tampa; vice-president, Leon Hale, of Tampa; and secretary and treasurer, D. W. Ramsaur, of Palatka.

Kansas Board.

One hundred and fifty-five merchants' licenses were granted by the Kansas Board of Pharmacy during the quarter ending February 15th; four pharmacists were registered; to one person a temporary certificate was given, and four received duplicate certificates.

At the meeting held on the above date at Wichita the following graduates of recognized schools of pharmacy were registered without examination:

J. Gerkens, of Lawrence; E. R. Hess, of Ottawa; S. N. Nite, of Topeka; and Walter Sledd, of Sterling.

There were sixty-nine applicants to be examined for registration; of this number the following twenty-nine were successful:

I. R. Aber, of Mound Valley; H. P. Craft, of Wichita; L. H. Combs, of Herrington; B. H. Crocker, of Hoisington; H. C. Deatz, of Hutchinson; J. G. Durham, of Douglass; Margaret Dykes, of Wichita; W. A. Fish, of Humboldt; J. A. Follick, of Minneola; W. L. Johnson, of Newton; W. J. Laird, of Wichita; E. McLaughlin, of Kansas City; C. O. Morris, of Valley Center; Miss Lee D. Mulvaney, of Kansas City; B. R. Murphy, of Meade; T. E. Payne, of Kansas City; J. H. Pinney, of Dorrance; M. S. Poorman, of Arlington; R. W. Quackenbush, of Wichita; A. T. Richardson, of Topeka; F. H. Ricketts, of Springhill; R. I. Roby, of Stafford; F. Shoemaker, of Fort Scott; A. E. Soiseth, of Turner; Harry Venning, of Allen; Lillian A. West, of Kansas City; R. H. Williams, of Winfield; and A. W. Wilson and H. R. Wilson, both of Carney.

The next meeting will be held May 25th, at Topeka.

Maryland Board.

The Maryland Board of Pharmacy is waging war upon those druggists who permit unregistered employees to perform pharmacists' duties in their stores. One druggist of Canton, a suburb of Baltimore, has been held under bail of \$500 to await the action of the grand jury; he is charged with leaving his store in charge of an unregistered clerk who compounded a prescription while alone.

Massachusetts Board.

Two examinations were held during the month of February by the Massachusetts Board of Pharmacy. Thirty-four candidates for registration were examined; eight were successful as pharmacists and nine as assistants. Their names follow:

As pharmacists—J. J. Barry, of Lowell; J. P. Barry, of Lynn; F. B. Chase, of Boston; N. L. Jean, of Arlington; A. T. Miller, Joseph Musman, and C. A. Papanti, all of Boston; and Daniel Reidy, Jr., of East Weymouth.

As assistants—D. J. Cavan, of Haverhill; J. H. Coakley, of Brockton; H. S. Cummings, of Quincy; J. F. Fagan, of Boston; C. W. Gibbs, of Providence, R. I.; A. M. McDermott, of Lowell; J. A. McGinty, of Holyoke; J. H. Moran, of North Adams; and C. A. Wells, of Salem.

Missouri Board.

At the meeting of the Missouri Board of Pharmacy held at Springfield, March 13th, there were seventy-seven applicants for registration. As a result of the examination forty-four secured pharmacists' license and eight were licensed as assistants. The successful ones are:

As pharmacists—V. A. Ashbridge, of St. Louis; C. B. Allen, of Shelby; B. Bardenwerper, of St. Louis; J. E. Boyd, of Sarcoxie; H. M. Carlisle, of Parma; H. E. Carter, of Licking; T. C. Dowles, of Kansas City; J. S. Elledge, of Lathrop; C. B. Ellis, of Kansas City; W. R. Gentry, of Independence; R. A. Greer, of Kansas City; A. B. Grier, of Strafford; W. A. Handley, of Edgerton; T. V. Harrington, of Kansas City; H. E. Harrison, of Plattsburg; R. F. Heidman, of New Haven; Everette Holmes, of St. Joseph; A. F. Hunt, of Buffalo; H. B. Jacobs, of Kansas City; W. L. Johnson, of Newton, Kan.; G. G. Kenbach, of Kansas City; W. W. Largent, of Portageville; C. J. Lempe, of New Cambria; W. L. Lierman, of Sedalia; D. A. McCollum, of Joplin; C. M. McConkey, of Lathrop; Paul McConnell, of Sarcoxie; C. J. McDonald, of Springfield; J. H. McKenna, of Joplin; C. R. Phifer, of Springfield; T. J. Phillips, of Joplin; W. W. Rodman, of Kansas City; William Roney, of St. Joseph; A. G. Ross, of Springfield; R. R. Sharp, of Topeka, Kan.; Frank Shoemaker, of Ft. Scott, Kan.; G. A. Shores, of Galt; A. E. Solseth, of Kansas City; E. H. Staton, of St. Louis; R. P. Stauffer, of Kansas City; E. E. Wassah, of Golden City; L. E. Westhoff, of La Grange; C. Y. White, of St. Louis; and J. J. Zumsteg, of Kirksville.

As assistants—Irl Bralt, of Sarcoxie; J. W. Burhaus, of Stoutland; Ernst Coday, of St. Louis; W. A. Goodnight, of Pleasant Hope; G. T. McKim, of Schell City; W. L. McQuarry, of Ash Grove; L. St. C. Shumate, of Reeds Springs; and Paul Van Evercarran, of Hannibal.

The next meeting of the board will be held April 10th, at Kansas City.

Five persons have recently been prosecuted by the board and fined for conducting drug stores contrary to law.

New Hampshire Board.

At the February meeting of the New Hampshire Board of Pharmacy out of seven persons applying for registration the following two were successful:

Z. A. Davis, of Dover; and L. N. Newton, of Manchester.

Pennsylvania Board.

The Pennsylvania Board of Pharmacy at a meeting held at Harrisburg, February 18th, examined 119 applicants for registration. Thirteen of these were successful as pharmacists and twenty-six as assistants. The names of the successful ones are:

As pharmacists—H. O. Dahlin, of Pittsburg; F. E. Eitner, of Easton; C. W. Greeninger, of Philadelphia; J. H. Henderson, of Kittanning; S. O. Jonkus, of Mahanoy City; C. H. Kline, Jr., of Philadelphia; J. P. Lengel, of Wayne; P. S. Pittenger, of Philadelphia; G. E. Ritchey, of Carlisle; F. G. Smith, of Westchester; I. S. Smith and R. L. Thomas, both of Pittsburg; and M. G. Waschko, of Mauch Chunk.

As assistants—J. A. Beaver, of Lock Haven; W. S. Brown, of Chambersburg; D. J. Brown, of West Hazleton; P. D. Coble, of Chambersburg; E. W. Colborn, of Philadelphia; R. R. Colley and X. K. Collmann, both of Wilkes-Barre; Lena De Gregoris, of Philadelphia; M. E. Engstrom, of Warner; J. M. Fry, of Lititz; H. F. Gerrity, of Pottstown; F. W. Hackett, of Bowdoinham; P. H. Jackson, of Blossburg; D. G. Kitzmiller, of Harrisburg; S. S. Kovacs, of Johnstown; A. F. McCormick, of Falls Creek; A. P. Macphree, of Philadelphia; W. W. Martin, of Shinglehouse; J. W. Murphy, of Curwensville; J. W. Parker, of Hawley; Robert Rabb, of Duncannon; E. F. Rouse, of Homestead; I. M. Rudminas, of Philadelphia; G. H. Stevens, of Rosemont; Leo Trambley, of Johnsonburg; and Brady Whitley, of Philadelphia.

The next meeting of the board will be held at Pittsburg and Philadelphia, June 8th and 9th.

Rhode Island Board.

At a meeting held March 7th, the Rhode Island Board of Pharmacy disposed of some routine matters and examined two candidates for registration; neither of these were passed.

The next meeting of the board will be held May 2d, at Providence.

Texas Board.

A regular meeting of the Texas Board of Pharmacy was held at Dallas, January 17th, seventy-seven candidates appearing for examination, about one-half of whom were successful. The ones who passed are:

As pharmacists—D. B. Blaine, A. O. Carden, P. D. Carroll, F. F. Chalfant, J. Y. Davidson, C. A. Duncan, A. E. Finlay, Jesse Grimes, W. M. Kerby, Rudolph Klein, G. C. Mangum, J. L. Mayes, L. A. Miles, L. Murphrey, J. A. Robertson, P. O. Roemer, H. O. Steglich, and C. D. Young, all of Dallas; E. L. Beckman, of Rowena; E. B. P. Black, of Sealy; W. E. Bratton, of Galveston; T. B. Bryden, of Marlen; J. G. Holland, of Ft. Worth; W. F. Humphrey, of New Waverly; Clifton Jarrett, of Ft. Worth; W. A. King, of Shreveport, La.; W. R. Manon, of Galveston; I. L. Pawelek, of Falls City; W. H. Ramsey, of Stephenville; J. E. Stone, of Jasper; G. G. Stripling, of Nacogdoches; O. L. Stuart, of Ft. Worth; L. E. Walker, of Columbus, O.; A. D. Wehinger, of Ft. Worth; C. A. Wilson, of Houston; M. L. Zacha, of Reinhardt; and Louis Zrubek, of Cistern.

As assistants—R. J. Blohm, of Ft. Worth; and J. H. Langhorne, of Henderson.

At this meeting the board decided to add bacteriology and physiology to the subjects embraced in the questions at future examinations. It was also decided that applications for examination must be in the hands of the secretary at least ten days prior to the meeting.

The next meeting of the board will be held at San Antonio, May 16th.

With the Women's Organization.

One of the most enjoyable occasions in the four years' existence of the Philadelphia chapter of the Women's Organization of the National Association of Retail Druggists was the birthday celebration February 16th and 17th. Representatives of a number of the sister chapters were present.

National President Mrs. Nellie F. Lee was "at home" to 150 callers on the afternoon of the 16th. On the following evening occurred the annual reception and dance at the Philadelphia College of Pharmacy building.

Mrs. Lee was the recipient of a silver belt-buckle in a W. O. N. A. R. D. design.

Wilmington (Del.) chapter, many of whose members had been present at the Philadelphia birthday party, entertained their Quaker City sisters at a reception and musical at the New Century Club, Wilmington, March 16th.

Baltimore Association.

Legislative conditions were discussed at length at the meeting of the Baltimore Retail Druggists' Association held February 18th. There seemed to be much dissatisfaction with the State food and drugs law as the criticisms of this measure were numerous.

The association elected the following officers: President, W. W. Cherry; vice-presidents, R. E. L. Williamson, Charles Morgan, and A. E. Muse; recording secretary, C. L. Meyer; corresponding secretary, Ephraim Bacon; and treasurer, W. M. Fouch.

Tri-Professional Fraternizing at Chicago.

Doctors, druggists and dentists totalling about 750 attended the "get-together" dinner given March 9th under the auspices of the Chicago Retail Druggists' Association with the assistance of the Chicago Medical Society and the Chicago Dental Society. President B. A. S. Hoelzer, of the C. R. D. A., acted as chairman, and Dr. A. H. Ferguson, president of the medical society, was toastmaster.

Mr. Hoelzer spoke briefly, extending fraternal greetings to the assembled guests, and then introduced Dr. Ferguson. The toastmaster entered upon his duties with a brief, eloquent discourse on "Harmony." He declared strongly in favor of letting in the public and extending to them all the benefits of co-operation.

O. U. Sisson, chairman of the C. R. D. A., committee on U. S. P. and N. F. propaganda, was in the nature of things the leading presenter of the druggists' cause. His address was lengthy but pertinent throughout; and his advice, that the professions get closer together because good business and professional ethics pointed in that way, was heartily received.

Dr. W. E. Quine, dean of the College of Physicians and Surgeons of Chicago, told of the worthiness of official medicaments from the prescriber's point of view. He gave to the pharmacists great credit for their activity in acquainting the medical profession with non-secret remedies. Dr. P. F. Buckley, a dentist, replied to the toast of "Unity," setting forth the trials of the dental profession through the exploiters of proprietary medicines. He called for a union of the professions for the betterment of mankind.

Dr. William Cuthbertson urged the doctors, druggists and dentists to combine to drive the fake nostrum from the medical world.

Wilhelm Bodemann heralded the prominence of Hyde Park in affairs politic and pharmaceutic. He told of the long-ago get-together meetings of the doctors and druggists of his section of the city and the beginning of propagandic work at these meetings ten years ago. In concluding he defined the propaganda as "just simple, old-fashioned honesty combined with good common sense," and urged his hearers to practice as well as preach the propagandic tenets.

Park Wins in the Supreme Court.

At last the supreme court of the United States has handed down its opinion in the long-drawn-out suit of the Dr. Miles Medicine Company vs. John D. Park & Sons Company. The former concern is a manufacturer of proprietary medicines and the latter is a "cut-rate" house which persists in selling proprietary medicines regardless of attempts on the part of their manufacturer to fix prices at which they shall be sold. The Miles people applied for an injunction which was denied by the circuit court of appeals. Justice Lurton, since raised to the supreme bench, delivered the opinion of the court of appeals. This opinion is now sustained by the supreme court, Justice Hughes delivering the opinion of that tribunal, Justice Holmes alone dissenting.

Getting Together in Ohio.

The Mahoning County (O.) Medical Society entertained about twenty-five members of the Youngstown Retail Druggists' Association at its February meeting. A discussion of National Formulary preparations was the feature of the occasion.

Dr. W. A. P. Andrews, of this city, was the principal speaker, pointing out the advantages of the official preparations over proprietaries. In the general discussion there seemed to be a unanimity with regard to the usefulness of the National Formulary.

Not a B. & B. Representative.

Bauer & Black, of Chicago, report that a person calling himself Howard W. Lester is calling upon the drug trade and presenting neatly printed business cards purporting that he represents the "Bauer & Black Mfg. Co., 2610-26 Dearborn street, Chicago, Ill." As this person is not and has never been in the employ of Bauer & Black they are warning the trade so as to preclude his obtaining money or other favors through a false impression.

Abe Martin says: "They make maple syrup out of corn-cobs that you can't tell from th' adulterated."

Porterial Philosophy.*

"There he goes; that be what they calls hustling," grunted William, as the new assistant brushed a measure-glass off the counter in his hasty passage.

"Ah, but I do tell ye, sir, it only be the man as is not clever enough to do his work quietly as needs to hustle."

"Ye don't quite follow me? Well, now, just ye watch men as go rushing about their work as if they'd a pound o' cowhage down their backs, an' ye'll find as they've very little to show for all their galloping."

"Aye, an' ye'll find it the same everywhere, an' ye'll notice as one of them coon singers'll make more noise an' confusion in two minutes than ye'll find in t' Bank of England in a twelvemonth."

"Mind ye, sir, I do not say as how there do not be hustlers as can get through their work, but them as does be of a rather different variety."

"I remember well the finest hustler as ever I met. He came here as second assistant, an' was that quiet ye might have thought that he'd gone to sleep."

"Well, that man used to lean on t' counter an' look round with a far-away look in his eyes. At first master was terr'ibly annoyed, but after a bit he found that whenever he got a good suggestion it came from that young chap, an' of course that quietened him a bit."

"An' I tell ye, sir, that lad was as full of good ideas as asafetida is full of smell."

"Aye, an' he could do two men's work in one man's time, because he'd allus got things arranged to make his work easy, an' never had to go looking for something as he'd put somewhere some time last week."

"Nay, I tell ye, that man was just the kind of hustler as I like. Never created nasty draughts, he didn't. No, he just used to save his legs by hustling his brain a bit."

"An' ye can take it from me, sir, a hustler is the one as knows how to do his hustling with his brain."

New Prerequisite Bill in Pennsylvania.

A bill providing for a bureau of preliminary professional education in Pennsylvania has been introduced in the legislature of that State by Representative D. J. Shern, of Philadelphia.

The bill provides for a board to be composed of physicians, dentists and pharmacists in equal numbers who shall certify to the fitness of a student before he can enter a college in that State granting degrees in medicine, dentistry or pharmacy. High school graduates shall be certified without examination.

What Is Tragacanth?

The United States has brought an action against J. L. Hopkins & Co., of this city, for the alleged adulteration and misbranding of tragacanth. The defendants claim that the offense, if one has been committed, grew out of a difference of opinion among authorities as to what constitutes tragacanth.

Prof. Henry Kraemer, of Philadelphia, has been elected a number of the council on pharmacy and chemistry of the American Medical Association, in place of the late Prof. C. S. N. Hallberg, of Chicago. Prof. Kraemer is one of the best posted leaders and teachers in American pharmacy, his specialty being botany and crude and powdered vegetable drugs, and he is also one of the truest men and most diligent and least spectacular workers in the ranks of his profession.

The Kentucky Agricultural Experiment Station proposes to conduct a school at which druggists may learn something of the application of food and drugs laws to their business, and how to conduct all parts of their business in compliance with such laws. Lectures in this school will be delivered during a term of about ten days, probably in the latter part of April or early in May. Those interested should address R. M. Allen, Lexington, Ky.

Dr. H. W. Wiley has accepted the invitation of the board of trustees of the New Jersey College of Pharmacy to speak on "Our Pure Food Laws" at the commencement exercises of the college, to be held in Krueger Auditorium, Newark, May 9th.

* Being the philosophizings of William the Porter as recorded by Bruce Logan in the Chemist and Druggist, of London, England.

Maryland Board.

The Maryland Board of Pharmacy is waging war upon those druggists who permit unregistered employees to perform pharmacists' duties in their stores. One druggist of Canton, a suburb of Baltimore, has been held under bail of \$500 to await the action of the grand jury; he is charged with leaving his store in charge of an unregistered clerk who compounded a prescription while alone.

Massachusetts Board.

Two examinations were held during the month of February by the Massachusetts Board of Pharmacy. Thirty-four candidates for registration were examined; eight were successful as pharmacists and nine as assistants. Their names follow:

As pharmacists—J. J. Barry, of Lowell; J. P. Barry, of Lynn; F. B. Chase, of Boston; N. L. Jean, of Arlington; A. T. Miller, Joseph Musman, and C. A. Papanti, all of Boston; and Daniel Reidy, Jr., of East Weymouth.

As assistants—D. J. Cavan, of Haverhill; J. H. Coakley, of Brockton; H. S. Cummings, of Quincy; J. F. Fagan, of Boston; C. W. Gibbs, of Providence, R. I.; A. M. McDermott, of Lowell; J. A. McGinty, of Holyoke; J. H. Moran, of North Adams; and C. A. Wells, of Salem.

Missouri Board.

At the meeting of the Missouri Board of Pharmacy held at Springfield, March 13th, there were seventy-seven applicants for registration. As a result of the examination forty-four secured pharmacists' license and eight were licensed as assistants. The successful ones are:

As pharmacists—V. A. Ashbridge, of St. Louis; C. B. Allen, of Shelby; B. Bardenwerper, of St. Louis; J. E. Boyd, of Sarcoux; H. M. Carlisle, of Parma; H. E. Carter, of Licking; T. C. Dowles, of Kansas City; J. S. Elledge, of Lathrop; C. B. Ellis, of Kansas City; W. R. Gentry, of Independence; R. A. Greer, of Kansas City; A. B. Grier, of Strafford; W. A. Handley, of Edgerton; T. V. Harrington, of Kansas City; H. E. Harrison, of Plattsburg; R. F. Heidman, of New Haven; Everette Holmes, of St. Joseph; A. F. Hunt, of Buffalo; H. B. Jacobs, of Kansas City; W. L. Johnson, of Newton, Kan.; G. G. Kenbach, of Kansas City; W. W. Largent, of Portageville; C. J. Lempe, of New Cambria; W. L. Lierman, of Sedalia; D. A. McCollum, of Joplin; C. M. McConkey, of Lathrop; Paul McConnell, of Sarcoux; C. J. McDonald, of Springfield; J. H. McKenna, of Joplin; C. R. Phifer, of Springfield; T. J. Phillips, of Joplin; W. W. Rodman, of Kansas City; William Roney, of St. Joseph; A. G. Ross, of Springfield; R. R. Sharp, of Topeka, Kan.; Frank Shoemaker, of Ft. Scott, Kan.; G. A. Shores, of Galt; A. E. Soiseth, of Kansas City; E. H. Staton, of St. Louis; R. P. Stauffer, of Kansas City; E. E. Wassah, of Golden City; L. E. Westhoff, of La Grange; C. Y. White, of St. Louis; and J. J. Zumsteg, of Kirkville.

As assistants—Irl Bralt, of Sarcoux; J. W. Burhaus, of Stoutland; Ernst Coday, of St. Louis; W. A. Goodnight, of Pleasant Hope; G. T. McKim, of Schell City; W. L. McQuarry, of Ash Grove; L. St. C. Shumate, of Reeds Springs; and Paul Van Evercarran, of Hannibal.

The next meeting of the board will be held April 10th, at Kansas City.

Five persons have recently been prosecuted by the board and fined for conducting drug stores contrary to law.

New Hampshire Board.

At the February meeting of the New Hampshire Board of Pharmacy out of seven persons applying for registration the following two were successful:

Z. A. Davis, of Dover; and L. N. Newton, of Manchester.

Pennsylvania Board.

The Pennsylvania Board of Pharmacy at a meeting held at Harrisburg, February 18th, examined 119 applicants for registration. Thirteen of these were successful as pharmacists and twenty-six as assistants. The names of the successful ones are:

As pharmacists—H. O. Dahlin, of Pittsburg; F. E. Eitner, of Easton; C. W. Greeninger, of Philadelphia; J. H. Henderson, of Kittanning; S. O. Jonkus, of Mahanoy City; C. H. Kline, Jr., of Philadelphia; J. P. Lengel, of Wayne; P. S. Pittenger, of Philadelphia; G. E. Ritchey, of Carlisle; F. G. Smith, of Westchester; I. S. Smith and R. L. Thomas, both of Pittsburg; and M. G. Waschko, of Mauch Chunk.

As assistants—J. A. Beaver, of Lock Haven; W. S. Brown, of Chambersburg; D. J. Brown, of West Hazleton; P. D. Coble, of Chambersburg; E. W. Colborn, of Philadelphia; R. R. Colley and X. K. Collmann, both of Wilkes-Barre; Lena De Gregoriis, of Philadelphia; M. E. Engstrom, of Warner; J. M. Fry, of Lititz; H. F. Gerrity, of Pottstown; F. W. Hackett, of Bowdoinham; P. H. Jackson, of Blossburg; D. G. Kitzmiller, of Harrisburg; S. S. Kovacs, of Johnstown; A. F. McCormick, of Falls Creek; A. P. Macphee, of Philadelphia; W. W. Martin, of Shinglehouse; J. W. Murphy, of Curwensville; J. W. Parker, of Hawley; Robert Rabb, of Duncannon; E. F. Rouse, of Homestead; I. M. Rudminas, of Philadelphia; G. H. Stevens, of Rosemont; Leo Trambly, of Johnsonburg; and Brady Whitley, of Philadelphia.

The next meeting of the board will be held at Pittsburgh and Philadelphia, June 8th and 9th.

Rhode Island Board.

At a meeting held March 7th, the Rhode Island Board of Pharmacy disposed of some routine matters and examined two candidates for registration; neither of these were passed.

The next meeting of the board will be held May 2d, at Providence.

Texas Board.

A regular meeting of the Texas Board of Pharmacy was held at Dallas, January 17th, seventy-seven candidates appearing for examination, about one-half of whom were successful. The ones who passed are:

As pharmacists—D. B. Blaine, A. O. Carden, P. D. Carroll, F. F. Chalfant, J. Y. Davidson, C. A. Duncan, A. E. Finlay, Jesse Grimes, W. M. Kerby, Rudolph Klein, G. C. Mangum, J. L. Mayes, L. A. Miles, L. Murphrey, J. A. Robertson, P. O. Roemer, H. O. Steglich, and C. D. Young, all of Dallas; E. L. Beckman, of Rowena; E. B. P. Black, of Sealy; W. E. Bratton, of Galveston; T. B. Bryden, of Marlen; J. G. Holland, of Ft. Worth; W. F. Humphrey, of New Waverly; Clifton Jarrett, of Ft. Worth; W. A. King, of Shreveport, La.; W. R. Manon, of Galveston; I. L. Pawelek, of Falls City; W. H. Ramsey, of Stephenville; J. E. Stone, of Jasper; G. G. Stripling, of Nacogdoches; O. L. Stuart, of Ft. Worth; L. E. Walker, of Columbus, O.; A. D. Wehinger, of Ft. Worth; C. A. Wilson, of Houston; M. L. Zacha, of Reinhardt; and Louis Zrubek, of Cistern.

As assistants—R. J. Blohm, of Ft. Worth; and J. H. Langhorne, of Henderson.

At this meeting the board decided to add bacteriology and physiology to the subjects embraced in the questions at future examinations. It was also decided that applications for examination must be in the hands of the secretary at least ten days prior to the meeting.

The next meeting of the board will be held at San Antonio, May 16th.

With the Women's Organization.

One of the most enjoyable occasions in the four years' existence of the Philadelphia chapter of the Women's Organization of the National Association of Retail Druggists was the birthday celebration February 16th and 17th. Representatives of a number of the sister chapters were present.

National President Mrs. Nellie F. Lee was "at home" to 150 callers on the afternoon of the 16th. On the following evening occurred the annual reception and dance at the Philadelphia College of Pharmacy building.

Mrs. Lee was the recipient of a silver belt-buckle in a W. O. N. A. R. D. design.

Wilmington (Del.) chapter, many of whose members had been present at the Philadelphia birthday party, entertained their Quaker City sisters at a reception and musical at the New Century Club, Wilmington, March 16th.

Baltimore Association.

Legislative conditions were discussed at length at the meeting of the Baltimore Retail Druggists' Association held February 18th. There seemed to be much dissatisfaction with the State food and drugs law as the criticisms of this measure were numerous.

The association elected the following officers: President, W. W. Cherry; vice-presidents, R. E. L. Williamson, Charles Morgan, and A. E. Muse; recording secretary, C. L. Meyer; corresponding secretary, Ephraim Bacon; and treasurer, W. M. Fouch.

Tri-Professional Fraternizing at Chicago.

Doctors, druggists and dentists totalling about 750 attended the "get-together" dinner given March 9th under the auspices of the Chicago Retail Druggists' Association with the assistance of the Chicago Medical Society and the Chicago Dental Society. President B. A. S. Hoelzer, of the C. R. D. A., acted as chairman, and Dr. A. H. Ferguson, president of the medical society, was toastmaster.

Mr. Hoelzer spoke briefly, extending fraternal greetings to the assembled guests, and then introduced Dr. Ferguson. The toastmaster entered upon his duties with a brief, eloquent discourse on "Harmony." He declared strongly in favor of letting in the public and extending to them all the benefits of co-operation.

O. U. Sisson, chairman of the C. R. D. A., committee on U. S. P. and N. F. propaganda, was in the nature of things the leading presenter of the druggists' cause. His address was lengthy but pertinent throughout; and his advice, that the professions get closer together because good business and professional ethics pointed in that way, was heartily received.

Dr. W. E. Quine, dean of the College of Physicians and Surgeons of Chicago, told of the worthiness of official medicaments from the prescriber's point of view. He gave to the pharmacists great credit for their activity in acquainting the medical profession with non-secret remedies. Dr. P. F. Buckley, a dentist, replied to the toast of "Unity," setting forth the trials of the dental profession through the exploiters of proprietary medicines. He called for a union of the professions for the betterment of mankind.

Dr. William Cuthbertson urged the doctors, druggists and dentists to combine to drive the fake nostrum from the medical world.

Wilhelm Bodemann heralded the prominence of Hyde Park in affairs politic and pharmaceutic. He told of the long-ago get-together meetings of the doctors and druggists of his section of the city and the beginning of propagandic work at these meetings ten years ago. In concluding he defined the propaganda as "just simple, old-fashioned honesty combined with good common sense," and urged his hearers to practice as well as preach the propagandic tenets.

Park Wins in the Supreme Court.

At last the supreme court of the United States has handed down its opinion in the long-drawn-out suit of the Dr. Miles Medicine Company vs. John D. Park & Sons Company. The former concern is a manufacturer of proprietary medicines and the latter is a "cut-rate" house which persists in selling proprietary medicines regardless of attempts on the part of their manufacturer to fix prices at which they shall be sold. The Miles people applied for an injunction which was denied by the circuit court of appeals. Justice Lurton, since raised to the supreme bench, delivered the opinion of the court of appeals. This opinion is now sustained by the supreme court, Justice Hughes delivering the opinion of that tribunal, Justice Holmes alone dissenting.

Getting Together in Ohio.

The Mahoning County (O.) Medical Society entertained about twenty-five members of the Youngstown Retail Druggists' Association at its February meeting. A discussion of National Formulary preparations was the feature of the occasion.

Dr. W. A. P. Andrews, of this city, was the principal speaker, pointing out the advantages of the official preparations over proprietaries. In the general discussion there seemed to be a unanimity with regard to the usefulness of the National Formulary.

Not a B. & B. Representative.

* Being the philosophizings of William the Porter as recorded by Bruce Logan in the *Chemist and Druggist*, of London, England.

Druggists Repudiate a Newspaper Lie.

An editorial article, top of column, large headline in regular editorial style, and all, appeared in a recent issue of the Fort Madison (Iowa) *Evening Democrat*, the gist of which was that a "local druggist is authority for the statement," etc., the "statement" being a thinly disguised advertisement of a proprietary article. Only last month (page 122) the CIRCULAR had something to say about deceptive advertisements of the nature of the one now under consideration. It seems that the druggists of Fort Madison are not dependent upon any law-making body to defend them from the kind of thing mentioned. They have a quicker way of setting themselves right with the public. Next day after the publication of the article in question, there appeared in the same paper the following notice:

The undersigned local druggists hereby deny the statement, published as editorial or reading matter in the *Evening Democrat* of March 3d, 1911. Such deceptive advertisements are repudiated by all honorable druggists.

Geo. H. Schafer & Co.

Axt Drug Co.

McKibben Drug Co.

Haver & Vincent.

Santa Fe Pharmacy.

By A. H. Stempel, Mgr.

Representing all the drug stores of Fort Madison, Iowa.

Just how the editor and publisher of the *Democrat* relished publishing a statement which, in effect, said that they had lied, and lied for money, for the purpose of misleading their readers, does not appear.

Warning Against Pedlers of Morphine Tablets.

Parke, Davis & Co., of Detroit, Mich., point out that manufacturing pharmacists often lose by theft considerable quantities of tablets containing narcotic drugs. In this connection they report that a man described as being about 5 feet 10 inches in height, having light brown hair, and wearing a light gray overcoat, who seemed to know the price of morphine, cocaine, etc., called on the Hort-Schaeffer Drug Company, of Omaha, Neb., about January 23d, and tried to sell 5,000 Parke, Davis & Co.'s hypodermic tablets No. 26, at \$5 per thousand. He said he had sold 30,000 already and had 5,000 more to sell. He refused to call again to see Mr. Hort. When the clerk tried to get the package number the stranger took back the tablets, remarking: "If you don't want them o. k., I can sell them without any trouble." He claimed to be from the East—either New York or Philadelphia—and said he sold different things at different times, and that now was the "time to get in easy as morphine, etc., was going up all the time."

Dean Oldberg to Retire.

The school of pharmacy of Northwestern University, Chicago, will celebrate its twenty-fifth anniversary April 12th. One of the features of the occasion will be a banquet at the Hotel Sherman.

In conjunction with this celebration, the faculty, alumni and students of the school have planned certain exercises in honor of Prof. Oscar Oldberg, who will then complete his twenty-five years of service as dean of the school, and retire from active teaching, the condition of his health requiring that he reside in a different climate during the winter.

The new officers of the Louisville (Ky.) Retail Druggists' Association are: President, J. J. Sieberg; vice-president, H. H. Bertelkamp; secretary, J. G. Krull; and treasurer, William Voteller. Simon N. Jones declined re-election to the office of president after having served in that capacity for twenty years.

Twenty-odd registered clerks of Racine, Wis., have organized the Racine Drug Clerks' Association with social and commercial objects. The following officers were elected: President, Charles Seyfurth; vice-president, Frank Weissse; secretary, Edward Schweitzer; and treasurer, J. Bittner.

New officers of the Baltimore Drug Exchange are: President, Henry F. Baker; secretary, Willoughby M. McCormick; treasurer, Dr. A. R. L. Dohme; executive committee, Frank G. Baily, J. Emory Bond, Alfred E. Mealy, A. C. Meyer and Parker Cook.

J. B. Webb, of DeWitt, Ia., treasurer of the Iowa Pharmaceutical Association for the past twenty-three years, has retired from business because of failing health.

Obituaries.

JOHN ATTFIELD.

The announcement of the death in London of Prof. John Attfield, one of the leading authorities on pharmaceutical chemistry, was received at this office by cablegram March 20th. Prof. Attfield enjoyed a high reputation in chemical and pharmaceutical circles in this country, and his works were recognized as a standard in many colleges and institutions. During the last few years his health had been impaired and he had retired from active work.

Dr. Attfield was born in Barnet, Herts, England. He received his education at his native place, entering the Pharmaceutical Society's school at the age of fifteen. He was first prize-man in all subjects in 1853 and 1854, and in the latter year became demonstrator of chemistry at St. Bartholomew Hospital, which place he retained until 1862. During this period he published the results of a number

JOHN ATTFIELD.

of researches on various chemical and pharmaceutical subjects, which secured for him election as Fellow of the Royal Society. He was then elected to the professorship of practical chemistry in the School of Pharmacy of the Pharmaceutical Society, in which he remained until 1896. He was one of the originators of the British Pharmaceutical Conference, which had for its object original scientific researches in connection with drugs, in 1863, its senior secretary from 1863 to 1880 and its president in 1882, 1883 and 1884. He was also president of the Herts National Historical Society from 1885 to 1887, and was one of the founders and for nine years a member of the council of the Institute of Chemistry. He held honorary membership in twenty-three societies and colleges of pharmacy in Europe and the United States.

Dr. Attfield's best known work is the manual of Pharmaceutical Chemistry, which is still in use in most schools of pharmacy. He was also author of lectures on the Relation of the British Pharmacopœia to Research, in 1864, and an improved Chemical Nomenclature for British and other Pharmacopœias, in 1871 and 1874. He was one of the three editors of the British Pharmacopœia of 1885, and was editor of two works on addenda to that Pharmacopœia in 1890 and 1898, as well as editor of the Colonial Addendum in 1900. He was the originator and maker of annual reports on the progress of pharmacy, and to his influence was partly due the union of pharmacists with physicians in the completion of the British Pharmacopœia in 1888.

Dr. Attfield for many years had a very large practice as a consulting and analytical chemist, and was frequently engaged as an expert in litigations on chemical subjects. He was a man of attractive personality and was always to

the front in upholding the standards of pharmacy. On his retirement from the professorship of chemistry in the School of Pharmacy his old pupils and assistants all over the world united in presenting him a service of plate and a handsome album containing their autographs. He was especially popular in Chicago for his aid in setting the college of pharmacy there on its feet after the great fire.

G. G. MINOR.

G. G. Minor, president of the Owens & Minor Drug Company, Ltd., of Richmond, Va., died at his home in that city February 27th. Mr. Minor was born at Richmond, December 3d, 1848, and spent the greater part of his life there. He started in business when quite young at Charlottesville, Va., as a clerk in a drug store. Then he entered the employ of the old Bodeker Drug Company, at Richmond, and from there he moved to the Powers-Taylor Drug Company, with whom he was employed until some twenty-eight years ago, when he went into business for himself in partnership with O. O. Owens.

JACOBUS H. VAN'T HOFF.

Prof. Jacobus Henricus van't Hoff, of the University of Berlin, the famous Dutch chemist and a Nobel prize winner in 1901, died at Berlin March 2d.

Prof. van't Hoff was born at Rotterdam in 1852, and received his education at the universities of Leyden, Bonn, Paris and Utrecht. He became a teacher in the veterinary school at Utrecht in 1876, moved to Amsterdam University in 1878, and to Berlin in 1896.

Following are recently reported deaths of other persons in the pharmaceutical world:

WILLIAM D. BANNARD, of Manistee, Mich.; December 30th, aged forty-five years.

GEORGE W. BROOKS, of Brooklyn, N. Y.; March 3d, aged seventy-four years.

WILLIAM BRUGMA, of Grand Rapids, Mich.; February 23d, aged seventy-two years.

W. H. BUNCH, of Beloit, Kansas; aged sixty years.

FRANK C. DAVIS, of Philadelphia, Pa.; January 11th.

FRANK DORSEY, of Baltimore, Md.; February 22d, aged fifty-six years.

GEORGE W. FORSYTHE, of Natrona, Pa.; February 23d; aged fifty-two years.

CHARLES GESICK, of Oklahoma City, Okla.

CHAUNCEY GILLET, of San Francisco, Cal.; March 8th.

HENRY J. GOLDING, of Corinne, Mass.; January 23d.

G. F. GOLDSBY, of Amite City, La.; February 17th, aged forty-two years.

F. M. GOODING, of Wilmington, Del.; March 19th, aged sixty-four years.

ROY L. GREER, of Portland, Ore.; February 24th.

ANDREW JEFFREY, of Toronto, Canada; February 25th, aged sixty-three years.

MAX KLEMCKE, of this city, March 5th.

LOUIS KLINZING, of Rochester, N. Y.; February 21st.

SAMUEL S. MARCY, of Cape May, Pa.

WILLIAM ERNEST MAYHEW, of San Francisco, Cal.; February 23d.

S. K. MORLEY, of Austin, Texas; March 12th, aged sixty-six years.

MAURICE MORRISSEY, of Morristown, N. J.; February 23d, aged seventy-four years.

CHARLES F. NIEDRINGHAUS, of St. Louis, Mo.; March 16th.

DANIEL F. O'CONNELL, of this city, February 18th, aged fifty-four years.

CHARLES W. PERRY, of Natick, Mass.; February 13th, aged fifty-one years.

CHARLES RIDGEWAY, of Yellow Springs, Ohio; aged seventy-four years.

Dr. FENWICK ROBERTSON, of Pikesville, Ind.; aged eighty-one years.

JOHN G. SCHAUFFERT, of Belleville, Mo.; March 8th.

EDWARD V. SEEBER, of Watertown, N. Y.; February 15th, aged sixty-five years.

SAMUEL S. SEELEY, of Bath, N. Y.; March 20th, aged seventy-seven years.

STANLEY G. SMITH, of Harrisburg, Pa.; January 1st, aged thirty-three years.

JOSEPH NAGLEE STEEL, of Brooklyn, N. Y.; February 23d.

A. C. TAYLOR, of Vineland, N. J.; March 22d, aged eighty-six years.

SAMUEL R. TILTON, of Catlin, Ill.

EDWARD WALTZ, of this city, March 14th, aged fifty-nine years.

J. HARRY WATSON, of Perry, N. Y.; March 16th, aged fifty-four years.

CHARLES WENKEL, of Ione, Cal.; March 14th, aged thirty-nine years.

JAMES A. WHITE, of Youngstown, Ohio; March 11th, aged fifty-five years.

JOHN A. WILLISON, of Terre Haute, Ind.; aged fifty-eight years.

Dr. MAURICE JOHN WHITE, of Burlington, Vt.; March 2d, aged forty-seven years.

Dr. Friedrich Engelhorn, proprietor of the business of C. F. Boehringer & Soehne, Waldorf-Manheim, Germany, died recently at the age of fifty-five years.

H. H. Deakyne, of Atlantic City, N. J., has the sympathy of his many friends because of the death of his mother at Clayton, Del., March 14th.

Just before the expiration of the sixty-first congress, the Mann public health bill passed the lower branch of that body, too late, however, for the senate to take action on it.

The Government Not So Slow.

Referring to the statement made in the CIRCULAR for last month in connection with the progress of work on the ninth revision of the Pharmacopœia, that the digests of criticisms prepared by the United States public health and marine-hospital service would probably not be completed until after the publication of the new Pharmacopœia, it may now be said that the government bureau was not requested to undertake the work of preparing these digests until three or four years after the issuance of the eighth revision of the Pharmacopœia, and that since that time it has given a good account of itself.

The Druggists Circular

Entered at the New York Post Office as second-class matter.

ESTABLISHED 1857.

Published monthly at
100 William street, New York, by
THE DRUGGISTS CIRCULAR,
William O. Allison, President and Treasurer.
D. G. Bogert, Secretary.

Address all communications to The Druggists Circular.

Subscription Rates.

For the United States and Mexico, TWO DOLLARS PER YEAR; if paid in advance, ONE DOLLAR AND FIFTY CENTS. Foreign and Canadian subscriptions, \$2 a year, payable in advance. Remittances should be made by Check, Express Order on New York, Post Office Order or Draft on New York, payable to The Druggists Circular.

Net Advertising Rates.

Special prices are charged for preferred positions.

Changes for standing advertisements should reach us before the TWELFTH of the month, as we commence printing on that date. New advertisements sent in before the 23rd of any month can be inserted in the following issue.

No order given to any representative of this paper becomes binding until approved by the publisher or manager.

Questionable or undesirable advertisements will not be accepted.

Classified Opportunities.

Advertisements are inserted under this heading without display except as to a portion of the first line; the charge is at the rate of 25 cents for six words, each figure, abbreviation or initial being considered one word. Terms: invariably cash with order.

THE DRUGGISTS CIRCULAR

A Practical Journal of Pharmacy and General Business Organ for Druggists

VOL. LV. NUMBER 5

NEW YORK, MAY, 1911.

WHOLE NUMBER 653.

Exit the Direct-Contract Plan.

There seems to be an impression on the minds of at least a considerable portion of the public, lay and pharmaceutical, caused by a recent decision of the supreme court, that hereafter there can be no legal plan by which a manufacturer of a proprietary article—drug or food—may protect the selling price of his goods. This impression is not a wholly correct one, for in his dissenting opinion Justice Holmes pointed out a way in which prices may be protected. This learned jurist said that by making the retail dealer an agent in law as well as in name, and retaining the title to the goods until they left the hands of the retailer, the manufacturer could control prices.

The decision in question is that in the case of the Dr. Miles Medical Company against the John D. Parks & Sons Company. This case has been in the courts and before the drug world for several years. It was for the purpose of compelling the upholding of the direct-contract price which the complainant had fixed for its goods. Retailers as well as wholesalers were parties to the contracts which had been entered into direct with the complainant. Lower courts had held that this direct-contract plan of marketing proprietary articles was a combination in restraint of trade and illegal, and the complainant had finally brought the case to the supreme court. That tribunal of last resort has now sustained the lower courts, and the plan has been relegated to the scrap-heap.

In delivering its judgment in the case, the supreme court, speaking through Justice Hughes, reviewed the forms of contracts in detail, told how the defendant had refused to sign a contract and had obtained its supply of the Miles goods by inducing those who had signed, to disregard the restrictions placed upon them. That these goods had been consigned the bill failed to allege. The supreme court pointed out that the court below had considered the jobbers' contracts as an effort "to disguise the wholesale dealers in the mask of agency," and had regarded the wholesaler as the "general owner and engaged in selling for himself and not as a mere agent of another." In citing this view of the lower court Justice Hughes alluded to the frequent recurrence in the allegations of the plaintiff's bill of such words as "sold" and "sale." As to the retailers' contract, he said that it "is clearly an agreement looking to sale and not to agency," and, "the so-called 'retail agents' are not agents at all, either of the complainant or of its consignees, but are contemplated purchasers who buy to sell again, that is, retail dealers." He quoted the de-

cision of Judge Lurton, in the Hartman case (reported in the CIRCULAR for April, 1907, page 332, and editorially commented upon in the same issue, page 290), in which that authority had said that to call purchasers of direct-contract-plan goods "agents" was simply to juggle with words. Parenthetically it may be mentioned that Judge Lurton was considerably abused by some of those who wished to see a different decision from him in that case, and his knowledge of law and his opinion as to facts were questioned. However, President Taft has elevated him to the supreme court bench, although he did not sit with that court when it was considering the case now under discussion.

The fundamental contentions of the plaintiff, as summarized by Justice Hughes, were "(1) that the restrictions are valid because they relate to proprietary medicines manufactured under a secret process; and (2) that, apart from this, a manufacturer is entitled to control the prices on all sales of his own products." In disposing of these, the learned justice said that while the manufacturer of a patented article was entitled to certain privileges in return for the invention he had made, which would become public property at the expiration of his grant, the manufacturer of goods under a secret process was entitled to no such consideration. Reiterating a principle of law that often has been laid before the readers of the CIRCULAR, Justice Hughes said:

The complainant relies upon the ownership of its secret process and its rights are to be determined accordingly. Any one may use it who fairly, by analysis and experiment, discovers it. But the complainant is entitled to be protected against invasion of its right in the process by fraud or by breach of trust or contract. *Tabor vs. Hoffman*, 118 N. Y., p. 36; *Chadwick vs. Covell*, 151 Mass. 190. The secret process may be the subject of confidential communication and of sale or license to use with restrictions as to territory and prices. *Fowle vs. Park*, 131 U. S. 88.

In other words, the fact that the plaintiff happened to have a monopoly in the manufacture of its preparations did not give it a right to such monopoly, as would be the case with goods protected by patent.

As to the second question, whether the complainant, irrespective of the secrecy of its process, was entitled to control the sale of goods of its own manufacture, the court said that the basis of the argument appeared to be that as a manufacturer may make a certain article and sell it, or not, as he chooses, he therefore has a right to fix the price at which the purchaser may dispose of it. The court said that this argument was not sound. A general restraint upon alienation,

it said, was ordinarily invalid. Again quoting Judge Lurton in the Hartman case, Justice Hughes said that such restraints were "generally regarded as obnoxious to public policy, which is best subserved by great freedom of traffic in such things as pass from hand to hand." Judge Lurton has pointed out that in *Coke upon Littleton* we read that if a man be possessed of a horse and "give his whole interest or property therein, upon condition that the donee or vendee shall not alien the same, the same is void, because his whole interest and property is out of him, so as he hath no possibility of reverter; and it is against trade and traffic and bargaining and contracting between man and man."

Citing its own decision in the copyrighted book case, with which CIRCULAR readers are more or less familiar, the court said that a manufacturer could not by rule and notice, in the absence of contract or statutory right, even though the restrictions be known to purchasers, fix prices for future sales.

The court quoted with approval the following: "The public have an interest in every person's carrying on his trade freely; so has the individual. All interference with individual liberty of action in trading, and all restraints of trade of themselves, if there is nothing more, are contrary to public policy, and therefore void. That is the general rule. But there are exceptions." It could not see that the present case was one of these exceptions, but held:

Agreements or combinations between dealers, having for their sole purpose the destruction of competition and the fixing of prices, are injurious to the public interest and void. They are not saved by the advantages which the participants expect to derive from the enhanced price to the consumer. . . . The complainant's plan falls within the principle which condemns contracts of this class. It, in effect, creates a combination for the prohibited purposes. No distinction can properly be made by reason of the particular character of the commodity in question. It is not entitled to special privilege or immunity. It is an article of commerce and the rules concerning the freedom of trade must be held to apply to it. . . . Nor does the fact that the margin of freedom is reduced by the control of production make the protection of what remains, in such a case, a negligible matter. And where commodities have passed into the channels of trade and are owned by dealers, the validity of agreements to prevent competition and to maintain prices is not to be determined by the circumstances whether they were produced by several manufacturers or by one, or whether they were previously owned by one or by many. The complainant having sold its produce at prices satisfactory to itself, the public is entitled to whatever advantage may be derived from competition in the subsequent traffic.

The questions involved were carefully considered and the decision reviewed by Judge Lurton in delivering the opinion of the circuit court of appeals in *Park vs. Hartman*, supra, and, in following that case, it was concluded below that the restrictions sought to be enforced by the bill was invalid both at common law and under the act of congress of July 2d, 1890. We think that the court was right.

In this manner did the court decide against the complainant under both the common law and the statutes.

In his dissenting opinion Justice Holmes agreed with the rest of the bench that the interest of the public was the thing to be conserved, but thought the

way to do this was to let the complainant carry out its own plan. He thought that the value and importance to the public of free competition as a means of fixing a fair price on commodities were greatly exaggerated. "I cannot believe," he said, "that in the long run the public will profit by this court permitting knaves to cut reasonable prices for some ulterior purpose of their own and thus to impair, if not to destroy, the production and sale of articles."

As to the effect of the decision it may be said that the trade was prepared for it by the disposition of this and similar cases in the lower courts several years ago. It does not mean that price cutting will again become rampant. The folly of price wars has so impressed itself upon the minds of the manufacturing, wholesale, and retail trades that no such contest is likely to gain much headway during the lifetime of the present generation. We have realized the losses which price wars entail, and our experience has shown us the futility of endeavoring to build up trade by cutting off our own noses to spite the faces of our competitors.

Speaking for the wholesale trade and as the recognized although unofficial organ of the National Wholesale Druggists' Association, the *Oil, Paint and Drug Reporter* says of the decision: "Wholesalers and jobbers realize the absolute need for stability of prices in proprietary articles, and we believe they will continue to maintain the wholesale prices named in the lists of manufacturers, although there may be no contract or agreement to that effect. There is no doubt about the right of a manufacturer to refuse to sell or consign goods to anyone he chooses to keep off his books." This calls to mind the fact that in another Miles case (reported in the CIRCULAR for August, 1909, page 421) Justice Lanning of the United States circuit court quoted Judge Archbald, who, in the Loder case, had said: "Undoubtedly the originator and compounder of a proprietary medicine may shape his own policy, and sell or withhold from selling, as he pleases, according to supposed self-interest or whim, fixing prices and naming the terms and conditions at and upon which alone he will do so, refusing to those who will not comply. And so far as this is confined to his own goods, and pursued by independent and individual action, it cannot be challenged."

N. A. R. D. Notes, owned and published by the National Association of Retail Druggists, which organization was the means of forcing price-restriction plans upon the manufacturing and wholesale branches of the trade in general, in commenting upon the present turn of affairs, admonishes its readers to "keep a stiff upper lip," saying that it is glad the question is settled and out of the way. It sees in the decision "something of value to the price-protection movement rather than a blow which will disintegrate it." Now that it has been made clear what may not be done, says *Notes*, those who wish to map out a price-protection campaign are in a better position than ever before to proceed along lines which will lead to results.

It Pays to Read a Good Drug Journal.

In a paper published in the CIRCULAR for May, 1903, page 100, Dr. Joseph L. Mayer deprecated the tendency of many druggists to fail to heed friendly advice, and their disposition to give slight attention to many things presented for their guidance in the pharmaceutical journals. He then told how some druggists by continued cleaning of the weights used in their prescription departments, in the course of time materially lighten those weights and thus run a risk of being arrested for dispensing some solution under strength, or of getting into complications with inspectors in other ways.

Evidently some of the druggists in this city did not take the time to read Dr. Mayer's article, or if they did, failed to heed the friendly advice given them therein, for the new and very active commissioner of weights and measures for this city has been inspecting the weights found in drug stores here and there, with the result that some of them have been reported light.

Those druggists who take the time to see what is in the journals devoted to their interests will find that time well spent, and those who do not—well, some of them have to spend a good deal more time in explaining things which could easily have been prevented, and are sometimes called upon to lay out money when their explanations are unsatisfactory. We sympathize with those who innocently break the law and are punished, and do what we can to reduce their number to the vanishing point.

The Witness Against New York Druggists.

Of the druggists in this city, good, bad and indifferent, whom a newspaper of the "yellow" variety has been hounding for the past month or more, one only, we believe, has so far been tried for his alleged offense, and he was acquitted. In defense of such men as are guilty of dangerous carelessness, or substitution or adulteration in the sale of drugs, we have nothing to say. The sooner the ranks of pharmacy are cleared of them, the better it will be for the public and for all competent and honest druggists. But for a newspaper to cast discredit upon an entire business by the use of the unfair methods so well understood and so frequently employed in the offices of the "yellow" press, is to put itself in the class of reprehensible evil-doers. Much harm has been done to individuals and to the public at large by the campaign to which we refer—a campaign in which truth and falsity, righteous condemnation and vilification were so interwoven that few not familiar with the subject could say how much of the crusade was justified by actual conditions and how much was "yellow" sensationalism—and it is to be hoped that some compensatory good will accrue to the careful and honorable men who constitute the main body of pharmacists. These latter are to be congratulated upon the fact that at a general meeting of the druggists of Greater New York, the action of the State board of pharmacy in coming to the aid of the district attorney in his efforts to bring the guilty to justice, was

approved. These things were chronicled in the CIRCULAR for last month.

One of the features of the investigation which no doubt impressed many newspaper readers not well informed in matters pharmaceutical as giving to it great weight was the eulogistic manner in which the paper in question introduced the chemist who had analyzed the drugs bought. Great stress was laid upon the fact that this chemist, Dr. Virgil Coblentz, was a professor in Columbia University; was a member of the revision committee of the United States Pharmacopoeia; and that somebody had said that he was one of the "few big men of the nation." This merely goes to show how dissociated facts may be used to mislead those who are unfamiliar with their true place in the history of events. That Dr. Coblentz is a professor in Columbia University, that he is a member of the committee of revision of the United States Pharmacopoeial Convention, and that he is one of the big men (in a class in which few men care to be placed) of the country, is true. But let us look further. He is a professor in Columbia University because of his professorship in the College of Pharmacy of the City of New York, which a few years ago entered into a working agreement with the university under which it became a department of the latter. He has not been a professor in Columbia University for twenty years as his "yellow" sponsor proclaims. It would seem, however, that Columbia University or the trustees of the college had tired of seeing testimonials concerning proprietary preparations printed in popular mediums over a name followed by the statement that the writer is a professor in the college or in the university, for a few weeks ago the resignation by Dr. Coblentz of his professorship in the college was accepted. So far there is no report to the effect that he has resigned from the committee of revision of the United States Pharmacopoeial Convention, although there has been some official dissatisfaction expressed at seeing the name of the committee tacked on to testimonials.

It is worthy of remark, too, that the name of the Professor was conspicuously absent from the list of delegates to the recent United States Pharmacopoeial Convention appointed by the College of Pharmacy of the City of New York. This conspicuity was emphasized by the fact that he had been a delegate from that body to the 1900 convention. Just why he was not re-appointed to represent the institution with which he was and had for long been identified, it might be indelicate to insist upon knowing.

This leaves the "big man" boast still to be looked into.

Prof. Coblentz's reputation as a chemist received a severe jolt in the American Pharmaceutical Association a few years ago. A sample of a chemical which he had certified contained ash, twenty-seven per cent., and ether-insoluble matter, thirty-seven and a fraction per cent., was found by a committee consisting of the late Prof. A. B. Prescott, Prof. Edward Kremers, and Prof. C. E. Caspari to contain less than three per cent. of ash and about five per cent. of ether-

insoluble matter. Prof. Coblenz endeavored to explain his report as to what he found in the preparation by saying that he had discovered twenty-seven one-hundredths of one per cent. of ash in the sample, and that "if any other figures were on the package it was a glaring error on the part of my assistant, who selected and marked the samples." An examination of the marking on the samples, however, revealed that the writing, even to the signature, "V. Coblenz," showed such a remarkable resemblance to specimens of the Professor's own chirography that those who compared them were unable to discover any difference. And in any case, twenty-seven one-hundredths of one per cent. is a long way from three per cent.

These are some of the things that have gone on the records of American pharmacy about a man who was selected for his part in this crusade, which has many more or less disreputable features, on account of the high positions he holds, his eminence as a chemist, and his unimpeachable credibility as a witness! These are excerpts from the record of the man whose testimony as to the percentages of drugs found in mixtures is depended upon to deprive citizens of reputations they have been all their lives in building up, as well as of their property, and perhaps even of their liberty!

A Branch of the Drug Business which Is Opposed to Public Policy.

Looking at the matter purely as a legal one, the supreme court of the United States has decided that the direct-contract plan of controlling the prices of proprietary goods is unenforceable. This fact was mentioned briefly in the CIRCULAR for last month, and the decision is commented upon editorially in this issue. The supreme court did not consider the merits of the medicines, whose sale, and the attempts to control which, gave rise to the legal action. Other courts, however, have done this, and if all such tribunals had presiding over them men of the type of Judge James R. Macfarland, of Pittsburg, we should perhaps see less of the time of our judiciary taken up in adjudicating differences growing out of the sale of nostrums.

In the case of the Miles Company against May (see the CIRCULAR for April, 1906, page 143), Judge Macfarland found, as conclusions of law, that the advertisements of the Miles Company were contrary to the statute against indecency in advertising; that the false statements of the plaintiff barred its action; and that the business of the plaintiff was contrary to public policy. He said: "On further consideration it is our opinion that the public health requires protection against these preparations and that the vender of remedies of unknown ingredients advertised and sold as remedies for disease should not be aided by courts of equity. If he sees fit to keep them a 'trade secret' and to persuade the public to 'dose' with his mysteries, let him not come into chancery. . . . The attempt to diagnose cases of heart disease, for example, without a physical examination cannot be too severely reprobated. . . . For one sick to diagnose his own

case is the height of folly, yet this plaintiff advises the poor deluded victim to pass upon subjects often baffling the highest medical skill, to settle the nature of the disease, and to then take 'Dr. Miles' nervine' or 'heart cure' or some other high sounding preparations of unknown ingredients, recommended in glowing testimonials. . . . The enormous business done by the proprietors of medicines and the serious menace which it is to the health and lives of the public, requires us to scrutinize carefully the ground upon which the plaintiff stands, and as it has shown that it belongs to the reprehensible class, we decline to grant the decree." It should be noted that Judge Macfarland held that as a matter of law the plaintiff would have been entitled to the relief sought but for the fact that it came into court with what the court, as just set forth, regarded as "unclean hands."

In speaking of the circuit court decision in the Hartman case four years ago, the CIRCULAR said that it was one which should help pharmacy, as it might lead to a cessation of the "pitiful task of 'boosting' disreputable nostrums."

The retail drug trade has many heavy loads to carry at best; it should not unnecessarily handicap itself by appearing before the public as a supporter and defender of the makers of nostrums whose sale is regarded by a chancellor in equity as "contrary to public policy."

Druggists and the Newspapers.

Two paragraphs quoted below from an editorial article in the CIRCULAR for March, 1901, are just as timely now as they were ten years ago, as, indeed, the whole article is. The reason the daily newspapers in the large cities are ever ready to say a slurring word about the druggist and never a word except of praise about the large department stores, is not hard to find.

We are glad that we have a personal acquaintance with a lot of druggists whom we consider respectable citizens, for if we did not know any of them personally the newspapers would force us to the conclusion that they were allowed at large merely because there had been no means devised by which their places in the community could be properly supplied.

But the newspapers cannot keep the public and the druggist apart, and so their lies, their innuendoes, and their parading of the black sheep in blacker type, is of little avail.

The context showed that what we meant by "little avail" was, little avail in making the public believe that all druggists were shady characters.

COLLEGE OF PHARMACY GRADUATION is a good thing, but it does not seem quite to do away with the necessity for board examinations. Two of our States have "prerequisite" laws which require that before a candidate can qualify for board of pharmacy examination he must be graduated by a "recognized" college. These two States are Pennsylvania and New York. At the examination held by the board of the first-named State, February eighteenth, one hundred and nineteen graduates of recognized colleges of pharmacy were candidates for license, of which number, thirteen passed as pharmacists and twenty-six as assistants. The same month the new board of phar-

macy appointed by the educational authorities of this State held its first examination. The total number of candidates examined was seventy, and we understand that considerably over half of them applied for certificates as pharmacists, only fifteen of the latter being successful. As bad as New York's showing is, on a percentage basis, it is far from being as bad as her sister State's. What kind of pharmaceutical education can it be that our young men and women receive during their two or three years at college, if, when they are fresh from the class rooms and quizzes only one in every three or four or half a dozen or more is able to pass a board examination? Or, what kind of a board examination are they expected to pass? Our colleges are supposed to teach their students what the latter should know in order to follow the profession of pharmacy. Our boards are supposed to ascertain whether or not the candidates for license they examine have learned a minimum of what it is necessary for them to know before they may be trusted to follow the profession of pharmacy. There is something wrong somewhere, and we pharmacists ourselves should find out what the trouble is and remedy it without waiting for some "yeller" or "muck-raker" in the lay press to lampoon, cartoon, excoriate and humiliate us for our shams, shortcomings or inconsistencies.

WHEN DAILY NEWSPAPERS BEGIN to discuss a more or less technical subject, the public is sure to be much "edified" and the technical man is apt to be either grieved or amused according to the humor he happens to be in. Referring to the direct-contract-plan decision of the supreme court, a daily newspaper writer delivers himself of this weighty opinion: "It would seem to be a reasonable assumption that if a retail druggist sells an article at a cut rate it is a matter which principally concerns the druggist and the purchaser. . . . The manufacturer in the meantime has been paid his own price for his product and has reaped his profit. That ought to be satisfactory to him and he should not undertake to dictate to the retailer the price at which the article shall be sold." All of which sounds very reasonable—to those who have not studied the subject. In actual practice, however, the interest of the manufacturer in maintaining the retail price of his medicinal specialty is greater than that of the retailer, for if there ceases to be a profit in the handling at retail of the specialty, the retailer will quickly turn his attention to something of a similar nature in which there is a profit, and Mr. Manufacturer, not Mr. Druggist, will be the loser. Manufacturers in all lines are realizing more and more the power wielded by the retailer, and are conducting their businesses accordingly.

ETHICS, ETHICAL and such words are not only shamefully over-worked but are frequently sadly abused. One might infer from much of the current literature that a drug store in which nothing is sold but supplies for the sick, no matter upon how low a moral plane it is conducted, is an "ethical" store, while another in which soda water, stationery and other side lines form the larger part of the stock is not "ethical," regardless of the fact that its proprietor is a man who is scrupulously honorable, just and considerate in all his dealings. As a matter of fact ethics are in and of the man, not the goods or the store. They are something like honesty and morality. Codes of ethics are bodies of rules intended to govern the

moral conduct of those to whom the rules properly apply. It is not ethical for a physician to prescribe a nostrum, because should he do so he not only is betraying the confidence which his patient reposes in his learning and integrity, but is furthering a deceitful and obnoxious business. Likewise, it is unethical for a pharmacist to dispense a drug that is not up to the standard or to sell a low-grade water bag for a high-grade price, although it is perfectly ethical for him to handle hardware and garden seeds, if the goods are what they should be. There are ethics in business just as much as there are in the professions, although the code may not be so strictly enforced in the former as in the latter; and a physician or pharmacist may present the outward appearance of being strictly professional while really being less ethical than an honest grocer.

TOO HARD ON THE NOSTRUM FAKERS it is almost impossible to be. Maybe sometimes some of our readers may feel that we are a bit severe on this class of our fellow citizens, but if such is the case their feeling is probably due to the fact that they are not so well acquainted with the ways of this class of industrious "workers" as we happen to be. The wiley nostrum faker is not in business for his own or anybody's else health; he is in business to make money, and the more of his medicine he can get the public to take and the longer he can get them to take it, the better he likes it. And when he can not "work" them any longer, he sells their names to one of his brother fakers and lets the brother "work" them a while, in the meantime getting a new list for his own use. Maybe the two fakers exchange lists; anything to catch the "sucker"—and "suckers" are not as numerous now, in the "patent"-medicine man's pond, as they once were. Just the other day we clipped the following from one of our city papers:

Wanted—Mailing list of probable buyers of patent medicines; rural districts; state terms and particulars. — Building, Washington, D. C.

The nostrum men know that the buying of what they term "patent medicines" is a manifestation on the part of the buyer of a certain kind of temperament, and that people who possess this kind of temperament are as likely to buy one nostrum as another. We all know that some people have a mania for taking any and every kind of medicine they can hear of, and for recommending that their friends and chance acquaintances do likewise. Just give the nostrum man the names of this kind of "suckers" and trust him to do the rest—"the rest" in such cases being the separation of the poor deluded one from his or her coin.

DRUG CLERKS' COST OF LIVING, like other people's cost of living, has gone up in the past few years—although, happily, a slight tendency in the opposite direction is noted just at present. What is a drug clerk's actual cost of living? Maybe he is a single man, maybe married. We assume that he is fairly well educated, moves in a good social circle, and has to make a presentable appearance both while on duty and off. What ought it to cost him to live? What should he pay for his board, his clothes, his books, pleasures, recreations and hobbies? He may live in a large city or in a country town; he may board with the proprietor's family or with his own; he may room over the store or at a hotel or own or rent a house; he may be a great lover of good literature and buy standard works and subscribe for the magazines; perhaps on his day off he sails a boat, plays golf,

rides a horse or a bicycle, or indulges in baseball. What does he have to spend? What should his clothes cost and how many should he have? Let the drug clerks answer these questions—or the proprietors, either, as to that. We want to hear from all sorts from everywhere. Their views reduced to print should make interesting reading. Names will be withheld upon request. Let the answers come.

COUNTER-PRESCRIBING AND SUPPLYING SIMPLE HOUSEHOLD REMEDIES are sometimes so close together that they seem to overlap and so make it nearly or quite impossible to say just where the dividing line between them lies. Of course no druggist should engage in the former, yet we feel sure that in spite of all we can say and do to discourage it, there will always be some who will allow their natural kindness of heart, their desire not to give offense, to induce them to go further in the direction of attempting to allay the ills of their customers than a strict compliance with the code of pharmaceutical ethics would allow. Still, we feel that by reminding druggists now and then of their duties, responsibilities and limitations with respect to this matter, we may do something to improve the status of pharmacy and aid in driving quackery out of the drug business, with which, unhappily, it is now so intimately associated in the minds of the public as to be considered by many as a necessary part of it.

DRUG CLERKS' SALARIES generally range from about twelve-and-a-half to twenty-five dollars a week. One drug clerk wrote to the CIRCULAR about his "weekly insult of eighteen dollars." The ministry is one of the "three learned professions" and some statistician has figured out that excluding those of the largest one hundred and fifty cities, the ministers of this country receive an average salary of five hundred and seventy-three dollars—less than twelve dollars a week. Of course, some of them get house rent free, a lot of gratuitous produce, and half rates at schools and on railroads, but most of them are settled men with families, men who have reached their goal, while drug clerks are usually young fellows who are simply in training for their life work. Practically all the successful retail druggists and a large proportion of the wealthy wholesalers went through the training that the drug clerks are now receiving.

DRUGGISTS HAVE "STOOD FOR" A LOT, but we believe nobody has ever said about them anything like this, taken from a newspaper report of a talk made by the New York commissioner of weights and measures, before a local woman's club: "Mr. Walsh told the women that they had no idea of the 'meanness, lowness, and rottenness'—not of other people's grocers and butchers, but of their own high-class tradesmen."

SATURATING THE HEAD WITH KEROSENE is recommended by the "editress" of a beauty column department as a remedy for nits. The treatment is certainly heroic and it seems that it should either kill or cure the cause of almost any trouble, from brain fever to nasal catarrh.

Newspapers tell of the death of a Yonkers woman the other day, caused by drinking wood alcohol in mistake for grain alcohol.

What does it profit a merchant to gain an argument and lose a customer?

Some Remarks on Adulteration, with Especial Reference to Buchu.

BY WILLIAM MANSFIELD, PHAR. D.

Since the enactment of the national food and drugs law, which gives to the Pharmacopœia added dignity and authority, examinations of crude and powdered drugs have been conducted with even greater care than heretofore. Investigations have shown that in some cases there has been an entire substitution of one drug for another, as, for example, ruellia or phlox for spigelia. Another form of adulteration, and one which is disquietingly common, is the addition to (or failure to separate from) an official drug an unofficial part of the drug plant. An example of this is seen in

Figure 1.

Adulterants of Buchu Stems.

Foreign twigs, grass, stems, etc., separated from the leaves and stems of buchu.

colocynth which has been powdered before the separation and rejection of its seed.

The substitution of ruellia and phlox for spigelia is due almost wholly to the lack of botanical knowledge possessed by the collectors, it being a well-known fact that there is little if any scientific collecting of drugs at the present time. This is due perhaps to the fact that the employment of labor more skilled, and consequently higher priced, would make the collecting of many drugs unprofitable commercially. I have not the least doubt, however, that could the collecting of drugs be directed scientifically, there would be no need to change the purity standards of the Pharmacopœia in certain specific cases; for instance, so as to allow 5 per cent. of clove stems in cloves, as has been proposed, and to allow stems in buchu leaves. Very often the amount of substitution of one plant part for another depends largely on the commercial value of the drug adulterated.

Buchu will perhaps illustrate this point as well as any of the official drugs. I might mention that in the last few years buchu has become less abundant, with a consequent rise in value from year to year. For-

merly the leaves were collected and sent to market with only traces of the stems present. To-day it is difficult to purchase buchu which does not contain

stems varying in amounts from 5 to 50 per cent. Such buchu, of course, does not conform to the official requirements, yet buchu adulterated with stems is imported and sold as an everyday matter. These facts tend to prove dishonesty rather than carelessness on the part of the collectors and dealers. It is argued in some quarters that the official standards must be changed to meet the trade conditions. To do this, it seems to me, would be a dangerous procedure if car-

Figure 2.

Cross Section of Buchu Stem.

1. Trichome. 2. Wavy epidermis. 3. Cortical parenchyma. 4. Secretory cells and cavity. 5. A group of bast fibers. 6. Sieve cells. 7. Medullary ray. 8. Phloem parenchyma. 9. Conducting cells. 10. Wood fibers and wood parenchyma. 11. Pith parenchyma.

This is a drawing of a radial section of a buchu stem 1.6 millimeters in diameter, showing a few of the epidermal cells modified into thick-walled roughish unicellular trichomes (1). The remaining epidermal cells have a thick wavy outer wall (2). Beneath the epidermis are several rows of cortical parenchyma cells (3) which extend to the bast bundles and in which are found the secretory cavities with the thin walled secretory cells (4). The bast fibers (5) occur in groups, varying greatly in size; the walls are whitish and of variable thickness. Inside the bast fibers, the small irregular sieve cells (6) occur in groups, sur-

Figure 3.

Cross Section of Mature Buchu Stem.

1. Wavy epidermis. 2. Thin side-wall enclosing dark cell content. 3. Thick outer-wall of the cork cells. 4. Reddish brown cell contents of the cork cells. 5. Cork cambium. 6. Phelloderm. 7. Cortical parenchyma.

In this figure is seen the cork formation or secondary growth as seen in the older, larger buchu stems. The wavy epidermis (1) which is the primary epidermis and which has disappeared on many portions of the stem, has thin side-walls and dark cell contents (2). Next to the epidermal cells occur several rows of peculiar arched cork cells with thick white outer-walls (3) and reddish-brown cell contents (4). The cork cambium (5) is typical in form, and it has formed one or two layers of phelloderm cells (6) which have the same form as the cambium cells but with thicker walls. Next to the phelloderm occur the cortical parenchyma cells. The remaining structure of the mature stem is identical with that of figure 2.

ried too far. Before lowering the pharmacopœial standards, the cause of the additions of stems, etc., should be carefully considered. In many cases the changed medicinal value of the drug due to changes in standards can be determined only by investigation. Any lowering of standard will, to a certain degree, de-

rounded by the phloem parenchyma (8). The radially elongated cells of the medullary rays (7) extend outward from the xylem increasing in number in the outer portions of the wood, and extending nearly to the bast fibers. No distinct cambium layer is visible. The conducting cells (9) occur throughout the xylem surrounded by the wood fibers and wood parenchyma (10). The latter is not very abundant in buchu. The medullary rays border on the conducting cells and extend outward to the phloem. The pith parenchyma cells are nearly circular in outline and often show a perforated end-wall when a cell happens to be cut just above or below that point.

Figure 4.

Powdered Buchu Stems. (For Explanation, See Bottom of Opposite Page.)

crease the efficiency of the drug, necessitating the administration of larger doses in order to produce the desired effect. Take, for example, colocynth. If 10 per cent. of seed is allowed in the ground drug, then the medicinal value of colocynth will be reduced in just that proportion. Buchu stems having the same active constituents as the leaves, but in smaller amounts, the activity of buchu will be reduced if 10 per cent. of stems is allowed in it, but just how much reduced is uncertain.

In drugs like ipecac, buchu and aconite, I can see no good reason for not permitting the presence of a small percentage of a plant part which is not now official, provided its collection with the official part cannot be avoided, or that in its separation from the official part unnecessary expense is involved. Hundreds of tons of domestic and imported drugs are used yearly in the extraction of their active constituents, and there should be a sharp line drawn between drugs used in this manner and those which enter into galenic preparations. The first mentioned class of drugs should not be excluded from commerce because they do not conform to pharmacopœial requirements. Some method could be devised by which the use to which the crude drugs were to be put could be determined, and standards fixed for them accordingly. It is a well-known fact that belladonna stems, like those of buchu, contain active constituents similar to those found in the leaves but in smaller amounts. If it is a commercial possibility to extract the alkaloids from the stems, then they should be allowed in commerce for that purpose.

Buchu containing a limited amount of stems will doubtless be allowed in the next Pharmacopœia, and whether this turns out to be a correct prophecy or not, it is desirable that the structure of the powdered leaves and stems be understood by those who may be called upon to differentiate between them and to identify the foreign matter with which the leaves and even the stems are frequently adulterated. With this in mind I have prepared the accompanying charts, by the aid of which any microscopist should be able to make the identification and differentiation.

Co-operation as to Credits.

By VICTOR LAURISTON.

At the end of a couple of months in Carisford, Wilkins gave more than ordinary heed to his books. His study of them he followed up with a number of personally conducted collecting tours. This in turn led to some earnest telephoning; and the telephoning proved the prelude to a little business conference at Schott's store, to which came Wilkins in his usual quiet, business-like way, and three other druggists with ill-concealed curiosity sticking out all over them.

Schott had the oldest drug business in Carisford, and the largest; Hawkhurst was a chill, suspicious sort of man; and Matten had a gruff, impetuous way which paid little heed to strange suggestions and resented any jolt from the rut. Watson alone looked good-naturedly at the new-comer when Schott, curious as were the others, indicated Wilkins as the individual responsible for calling the druggists of Carisford together for the first time in history.

"It's just this way," commented Wilkins, briefly. He felt that his reception would be cold, and the feeling made his manner a bit awkward. "Quite a few fellows have got into me—or rather, into my books—since I came here, and I dare say all of you have had the same experience. It has occurred to me that if we got together, and pooled our knowledge on the subject of dead-beats and slow-pays, it would save us each a nice little pile of dollars."

Wilkins had been staring modestly at the floor while speaking. Now he glanced up enthusiastically, despite his forebodings still expectant of encouragement. A chill frown passed around the circle.

It was Schott who spoke. "We are very careful with our credits," he remarked, frigidly, "and I think we are quite capable of looking after them. It's a pretty slick dead-beat that can get ahead of us. If he does get credit," he concluded, pompously, "I can just assure you that he'll earn it."

"Looks to me like a case of the careful man burning his fingers pulling the careless chap's chestnuts out of the fire," barked Matten. "Now, I watch my credits pretty closely. But suppose you, Wilkins, not

Explanation of Figure 4, Opposite Page.

1. Trichomes. 2. Epidermal cells, the larger pieces reddish-brown; the small aggregations white. 3. Transverse cortical parenchyma. 3'. Longitudinal cortical parenchyma with sphaero-crystalline masses of hesperidin. 4. Bast stereome. 5. Spiral, scalariform and reticulate conducting cells. 6. Rosette crystals of calcium oxalate. 7. Wood parenchyma near the pith with porous walls. 8. Pith parenchyma with porous side and end walls. 9. Wood fibers with oblique pores.

Powdered buchu stem has many striking features which make it easy of identification when mixed with buchu leaves. A few unicellular rough, thick, white-walled trichomes (1) occur distributed throughout the field. They are straight or slightly curved and vary in length from 40 to 100 microns; in thickness at the bast they measure from 10 to 22 microns. The central cavity varies greatly, and in some trichomes seems to have disappeared entirely. The epidermal cells (2) are very characteristic, occurring singly or in groups of two or more. The cells from the older stems often appear reddish-brown by transmitted light, while the epidermal cells from the younger stems appear whitish-opaque (porcelain-like). They are usually six-sided and angular in outline. The cortical parenchyma cells (3) on transverse view have a rounded cell cavity and intercellular spaces between the walls. The double walls vary in thickness, the greatest thickness being about 9 microns. The parenchyma

cells (3) on longitudinal view show square ends and often contain sphaero-crystalline masses of hesperidin. The thin-walled sieve cells and the surrounding cells are scarcely ever seen in the powder. The white-walled pointed stereomes (4) are a characteristic feature of the powder; they vary greatly in length, in diameter and in the thickness of their walls. In a number eighty powder the fibers are mostly broken. The greatest length of the unbroken fibers is 1.25 microns. The thickest wall measured 5 microns and the greatest observed width was 25 microns. The spiral reticulate and scalariform thickened conducting cells occur scattered throughout the powder. The reticulate and scalariform cells usually occur with wood fibers. It is an interesting fact that the spiral thickenings in conducting cells is usually separate from the side-wall and nearly always appears as indicated at 5. An occasional rosette crystal of calcium oxalate (6) is seen in the field. The wood parenchyma (7) which makes up a very small percentage of the xylem is not readily found in the powder. The pith parenchyma cells (8) have thick porous side walls and perforated side walls. The wood fibers (9) usually occur in masses surrounding the conducting cells; when occurring singly, the oblique pores readily distinguish them from the bast fibers.

The diagnostic elements of powdered buchu stems are: First, trichomes; second, reddish-brown and white-angled epidermal cells; third, the long white bast fibers.

knowing the town or being careless, don't keep your eyes peeled and fail to handle the credit proposition quite so well. If I put into the pool all the knowledge I've been piling up these ten years and you what you've picked up in about ten weeks, I'm the loser and you're the gainer."

"That's just the size of it," commented Hawkhurst, briefly.

Wilkins glanced despairingly at Watson. "What do you say, friend?" he inquired. Watson shrugged his shoulders. "You've heard the verdict," he remarked with a touch of kindness. "I wouldn't object to going into the scheme, for the sake of the profession; but I can't see that it's much use unless we all go in together."

"It's up to each to hoe his own row," added Schott, in his usual icy tones.

"It's up to each to hoe his own row," repeated Wilkins, in an odd voice. "Very well, gentlemen." He bowed, and walked out without another word; but he heard Matten laughing after him, and barking some contemptuous comment of his colleagues.

During the day the new druggist pondered the problem very seriously in odd moments when he wasn't busy waiting on customers, filling prescriptions, opening packing cases and keeping Jimmy on the move. Afterward he sat late in the little upstairs office, conning over his books by the light of an incandescent bulb and jotting down the names of the delinquents. "Fifty dollars behind," he commented grimly. "Fifty dollars in ten weeks. Whew! It's hard lines in a town like Carisford." And then he drew up a little catechism.

"Just charge 'em up an' I'll pay you on Saturday night," remarked a shoddy looking character next day; and Wilkins, with a smile, drew out his catechism.

"Name?" "Arthur Jawkes." "Street address?" "One twenty-two Courtland." "Where employed?" "Carisford Iron Works." "How do you wish to pay?" At the sound of the third question the telephone bell tinkled.

"Ain't this a rum go?" exclaimed Mr. Jawkes good-naturedly, somewhat taken aback by the innovation.

Wilkins laughed. "This is often used in the large cities," he remarked.

The dispensary curtains were pushed aside, and Jimmy's round face appeared, with his right eye wrinkled out of sight.

"You prefer weekly settlements, Mr. Jawkes?" commented Wilkins. "That will be perfectly satisfactory. That's a rather heavy parcel—I'll be glad to have the boy take it up for you. Pleased to meet you. Call again."

Half a dozen times during the first day the same performance was enacted, without undue ostentation. Twice Jimmy from behind the curtains winked his left eye, with the result that credit was refused.

"Ain't got any such name on the pay-roll?" explained Jimmy the first time, after the man's departure; while "Fired him last week," was his second comment.

The two rejected were added to the store's dead-beat directory, and Wilkins once more went after some of the other dead-beats. He moreover sedulously cultivated the acquaintance of the grocer on one side of his store and the hardware-man on the other. To these he imparted quite a bit of information, and received a great deal more in return. Dead-

beatism in all places runs, as it were, in strata; and this fact Wilkins speedily discovered. Special study taught him to discriminate.

One day he chanced to meet Watson. "How are the dead-beats coming on?" asked Watson, with a touch of geniality.

"Not so bad," replied Wilkins, urbanely.

"Did that old fellow, Buffer, who just skipped out get into you any?" added Watson.

"Five cents the first week I was here," laughed the new druggist. "How'd you fare?"

"Two-ninety-eight," laughed Watson. "But he managed to squeeze nearly forty dollars' worth of goods out of our friend Schott."

"That's hard," returned Wilkins, complacently. "Why, after what I wrote off three weeks ago I've added to the books only about a dollar that seems at all shaky."

Watson's eyes opened wide. "You must watch them pretty closely," he muttered, as Wilkins, grinning, moved on.

In the middle of the afternoon Wilkins had an anxious telephone call from Matten. "Say, Wilkins," asked he, abruptly, "d'you know a fellow named Hooper? Is he any good? I've got eleven dollars against him and he doesn't seem to be moving."

Wilkins laughed softly. "What about the careful man's fingers and the careless man's chestnuts?" he inquired. Then added: "Which Hooper is it?"

"John R."

"He came to me just a week ago," returned Wilkins, "and I turned him down hard. I know a merchant he has got into pretty heavily."

"Guess I know one, too," muttered Matten. "Thanks, old man."

Wilkins sat and grinned; and then grinned some more. "Say, Jimmy," he exclaimed, "I guess we see ourselves the oasis in the desert, and the caravan traveling our way. Hawkhurst was at me yesterday—wanted to load up with dates (I mean data) regarding half a dozen wolves in the fold. There's just our friend Schott left to come in."

But Schott hung out, obdurately; and Wilkins went his business way, picking up all the information he could. He made the standing of his credit customers a study—an unobtrusive study, but nevertheless a careful one. He used his catechism, sometimes indirectly, at other times directly but politely, on each new applicant for credit; and, before a second credit was added to the first, Wilkins knew his man's standing even better than he knew his pharmacopœia. All this information was tabulated in a card index file on his desk for ready reference; and there, at a moment's notice, he could find the history of each credit patron from the ground up. And what surprised him most was the slowness of the friction entailed when the scheme was rationally explained to the people who bought on credit.

Jimmy entered into the scheme with eagerness, and handled his role with surprising discretion. One day he came racing into the store at top speed. "Say, governor," he panted, "that old Skipwith that owes us \$2.55 is leaving for the West on the 3:18 this afternoon, and his goods are going with him. You'd better nail him at the depot and collect that little bill."

"Thanks, Jimmie," commented Wilkins, as, with a glance at the clock, he put on his hat.

"I'll bet old Schott will cuss himself," added Jim-

mie, gleefully. "Old Skipwith used to deal with Schott right along."

Wilkins, his hand on the door-knob, paused for a single hesitant moment; then turned back, and stepped to the telephone. His conversation lasted only a few minutes, and his portion of it was spoken in a whisper which he knew Jimmie, if he were listening, could not hear. However, Jimmy knew Schott's number, and he thought he heard it called.

"I'll be back in a few minutes, Jimmy," he added, aloud. "I'm going to the station."

Jimmy grinned meaningly. Wilkins, in his progress to the station only a block distant, sauntered along in leisurely fashion. He knew his ground, and was purposely taking his time. Matten's simile of the chestnuts occurred to him and he laughed softly to himself; as he turned the corner of the little depot and crossed the platform his laugh grew just a trifle louder. A few paces distant two men were excitedly conversing. They were Skipwith and Schott. The latter glanced up and beckoned to Wilkins.

"I will send the money from Vancouver, I sure will," declared Skipwith, emphatically. "Just so soon as I get there —"

"You'll not get to Vancouver to send it unless you pay it now," cried Schott, excitedly. "I've been bit by too many of your sort of people already. You pay or you stay—that's final."

"Good afternoon, gentlemen," interjected Wilkins, genially. "Just thought I'd let you know the amount of that little account, Mr. Skipwith, for I knew you didn't want to leave any such little, trivial bills behind you. It's only \$2.55."

"But I have no money," protested Skipwith.

"And my \$43.87," added Schott, insistently. "I want that. And if I don't get it inside of five minutes, it's the cooler for yours for trying to skip the country."

Skipwith glared at him for one angry moment; then stared, red-faced, at the platform. He muttered, disgustedly, then thrust a hand deep into his trousers pocket. "Well, here you are," he said, producing the money. As the train thundered in and the angry and crestfallen Skipwith boarded it, Schott stared a moment at Wilkins. Then he put out his hand. "I guess," he added, when Wilkins had shaken it warmly, "that we'd better get together as you suggested the other day and pool our credit information. I think it would do a powerful lot of good, after all."

Celtium, an Alleged New Element.

Urbain (*Compt. rend. through Chem. and Drug.*) in the course of a series of fractional crystallizations of a nitric acid extract of certain of the rare earths containing lutecium and scandium, has obtained a substance which he believes to be a hitherto unknown element. He has named it celtium, and assigns to it the symbol Ct. It is intermediate in its properties between lutecium and scandium.

Unna's Absorbent Paste.

Dreuw (*Monat. f. prakt. Derm.*) credits to Unna the following formula for an absorbent dermatological paste:

Zinc oxide.....	15 grammes.
Precipitated silica.....	3 grammes.
Benzoinated lard.....	42 grammes.

Hydrastis.*

By PROF. JOHN URI LLOYD.

Hydrastis canadensis is native to North America. Once abundant in the thick woodlands of the Central West, in the territory bordering the Ohio River from Illinois to Virginia, it is now in its native home practically exterminated. *Hydrastis* is known by the common names, golden seal, yellow puccoon, yellow root and other similarly expressive appellations signifying its color or applying to its nature. The root of this plant, of a rich golden-yellow, like its companion, *sanguinaria*, which, however, has a red color, was used by the Indians as a cuticle stain, and also as a dye for their garments. Being exceedingly bitter, it was also useful in repelling insects, when mixed with grease and smeared upon the skin, and hence served a double purpose in the use of primitive man.

The first printed conspicuity of *hydrastis* came from a paper read by Mr. Hugh Martin before the American Philosophical Society, 1782, published in the Society's Transactions, 1783, under the title "An Account of Some of the Principal Dyes employed by the North American Indians." By reason of its red berry, *hydrastis* was also called ground raspberry. Although it had been mentioned in various medical publications, the drug was held in slight repute, and was of no commercial importance until the advent of the American eclectics, who first prepared its alkaloidal salts for professional use. Its medical history dates from its use by the Indians, who introduced it as a native remedy to the earliest botanical explorers, and to settlers. Its therapeutic qualities were overlooked, however, by Kaln, 1772; Cutler, 1783; and Schoepf, 1785; Barton first bringing it before the medical profession, 1798. He credits the Cherokee Indians for its ascribed uses, and in the third part of his work (1804) he devotes considerable attention to the drug. Rafinesque (1828) states that the Indians employed it as a stimulant, and that the Cherokees used it for cancer, in which direction better remedies were to them known. The principal use of *hydrastis* by the Indians, however, and which afterwards crept into domestic practice, was as an infusion or wash for skin diseases, and for sore or inflamed eyes. It was also employed as a stimulant for indolent ulcers, and as an internal tonic. *Hydrastis* may be considered typical of the drugs that are employed very extensively by the medical profession, through their empirical introduction, it being recorded that even for gonorrhea the Indians discovered its utility.

Early authorities on American medical plants, such as Barton (1798 and 1804), Hand (*House Surgeon*, 1820), Rafinesque, Elisha Smith (1830), Kost (1851), and Sanborn (1885), give to *hydrastis* considerable conspicuity, whilst Dunglison's Medical Dictionary pessimistically (1852) states that in Kentucky only it is used, and then only as an outward application for wounds. In this Dunglison is "authority," but does not give the fact. (See *Drugs and Medicines of North America*, pages 154 and 155.)

*Bulletin No. 18, (Pharmacy Series No. 4), will give a brief history of every vegetable drug of the Pharmacopœia of the United States, 1900 edition. This bulletin, like other Lloyd Library publications, is not in general circulation, nor is it sold commercially, being designed solely for exchanging for the publications of societies and academies of science. Extra copies will be printed for those who, before May 15th, address, with one dollar, The Lloyd Library, Cincinnati, Ohio.

Competent and Mannerly Drug Clerks.

Prompted by the fact that he had recently talked to a proprietor who found it difficult to obtain the kind of clerk that he wanted, Charles H. Bowersox read a paper at the January meeting of the executive board of the National Association of Pharmacologists in which he set forth some of the qualities which he advised his fellow drug clerks to cultivate. He frankly admitted that it is frequently the case that clerks who are well versed in drugs and skilled in the art of compounding, are sadly deficient in salesmanship, or in some other way, and vice versa. He found, too, that this condition is noticeable among proprietors.

If all the proprietors and managers were qualified in the various ways that they should be, he believed there would be a marked improvement in the quality of the clerks, and that the future proprietor would come nearer being what he should be. A poorly-trained employer usually meant a poorly-trained clerk, who, in turn became a poorly-trained employer, and gave poor training to clerks. Proprietors should teach their clerks ethics which no college of pharmacy or business college can teach him.

The author of the paper thought that when a young man had been clerking in a drug store for two or three years and was still undecided as to whether he liked it, he had better quit. He expressed admiration for the man who, having decided upon his vocation, concentrated his forces to get the best out of it that he could. Continuing Mr. Bowersox said, in part:

No drug clerk should be satisfied with knowing nothing beyond prescription compounding, or only knowing how to effect sales; for although these are two very important matters and should be thoroughly understood, there is very much more that the clerk should know in order to be successful.

He should be familiar with the duties of the various persons connected with, or employed in a drug store; this will be necessary in the event that he should decide to embark in business on his own account.

Waiting on trade (as we commonly express it) is performed in a very ill manner by many clerks. Not long since, I had occasion to enter a grocery store for the purpose of making a purchase; while there I observed one of the clerks with his hat on and whistling while in the act of selling to a fashionably dressed woman a bill of groceries. No clerk can by indulging in such ill manners expect to build a gigantic business for his employer.

The clerk should display wisdom, be courteous, and dispense cheerfulness at all times. He should greet his customers with a kind "good morning," and extend to them an invitation to "call again"; and saying "thank you," after effecting sales, should become a habit with him. . . .

His attention to the "little folks" should be such as to win the patronage of the parents; for the older folks prefer to trade where their children are treated right.

It does not take the public long to learn how much or how little a clerk knows about his business—most persons prefer to be "waited on" by a clerk who can talk intelligently about his line of merchandise, and many persons will go a distance of two or three squares out of their way in order to trade with a clerk whom they know to be thoroughly competent and reliable.

Danger of Taking Another's Medicine.

A case of fatal poisoning is reported from England which was caused by one person taking a medicine intended for another. A woman had been taking, on medical advice, a mixture containing strychnine in fairly large doses and had become gradually accustomed to increasing doses of the drug. Some of this mixture had remained unused for a time and a dose of it was eventually taken by a sister of the woman,

with the result stated. In view of the risks to life and health from one person taking medicine prescribed for another, it would be well for physicians and pharmacists to caution patients to see to its prevention while using and to destroy unused medicine.

Peace Hath Her Victims No Less Numerous Than War.

The following table is taken from an article on "The Sane Fourth," in the *Journal of the American Medical Association* a year or so ago:

Battles.		Celebrations.	
Killed and Wounded.		Killed and Wounded.	
Lexington	83	July 4, 1903.....	4,449
Bunker Hill.....	449	July 4, 1904.....	4,169
Ft. Moultrie.....	37	July 4, 1905.....	5,176
White Plains.....	100	July 4, 1906.....	5,446
Ft. Washington.....	149	July 4, 1907.....	4,413
Monmouth	229	July 4, 1908.....	5,623
Cowpens	72	July 4, 1909.....	5,307
	1,119		34,603

Commenting upon these figures, the *Medical Fortnightly* says: "If old King George III could rise from his grave and see the above figures, he might say something like this: 'You rebels! You are getting your just deserts, and from your own hands. A just dispensation of Providence!'"

Last year the number of killed and wounded as a result of Fourth of July celebrating was placed at 2,923, the falling off being due to efforts of sane citizens to stop the annual outburst of barbarism.

Physicians and Pharmacists.

It seems strange, says the *Toledo Medical Report*, that some physicians and druggists cannot understand that their interests are mutual and that nothing can be gained by fighting each other. There is no doubt that there are faults on both sides, but instead of a campaign of mud-slinging which will only result in bitterness and drifting further apart, let us get together, get better acquainted and discuss these questions with fairness, and no doubt all will be benefited. The main thought, after all, should be, how we can benefit our patients most, and we think that this can be better accomplished by the two professions getting into closer relationship and working to their mutual advantage.

Niemeyer's Pill.

Bolenius (*Journ. Am. Med. Asso.*) gives the following as the formula originated by Felix von Niemeyer:

For each pill—

Powdered digitalis.....	½ grain.
Powdered ipecac.....	¼ grain.
Powdered opium.....	¼ grain.
Extract of helenium....	enough to make a mass.

Waterproof Cement.

Coal tar.....	12 parts.
Indiarubber	1 part.
Powdered shellac.....	20 parts.

Heat the tar and the rubber gently together; when homogeneous, incorporate the shellac. Pour the mass on a flat surface to cool. For use the cement is heated to about 250° F.

Abstracts

Waste of Life.

The *Medical Record* referring to a pamphlet on this subject recently published by an insurance company says: "It would be a waste of time to insist that lives are frequently carelessly thrown away; this must under existing conditions happen in all industrial countries, but the point perhaps that requires to be driven home is that in this country less care is taken to conserve life than in many other countries. Facts that may be especially noticed are that since 1880 the general death rate has decreased up to age 40, while above 40 it has steadily increased. From age 40 to 50 it has increased 13 per cent.; from 50 to 60, 29 per cent.; 60 and over, 26 per cent. This increase, then, is almost wholly due to degenerative diseases. The increase of cancer has been so often referred to that it needs little comment. The mortality from diseases of the heart, arteries and kidneys appears to be increasing by leaps and bounds. In the pamphlet under discussion it is stated that to check the enormous loss of life, a large proportion of which is preventable by the use of ordinary measures, the national government can spare but 1.3 per cent. of its total expenditure; Greater New York but 1.7 per cent., and 148 American cities but 1.8 per cent. The State of New York spends for the protection of game, fish and forests about four times more than it spends for the State Health Department. Of course, it is clearly apparent that more money by far should be expended by States and municipalities on the prevention of pollution of lakes, rivers, and streams, on providing a good milk supply, on strict supervision of all kinds of foods, and especially on the erection of sanitary buildings for the working classes. If these matters received the undivided attention of federal, State and municipal authorities the waste of life in this country would be greatly lessened."

Nutritive Suppositories.

Suppositories of the following composition for rectal feeding have been recommended by Boas (*Berl. klin. Woch.*) to replace nutritive enemas, which it is frequently inconvenient to administer and which do not always give the full nutritive value. The suppositories, which are 6 cm. long and about 1 cm. thick contain about 20.5 per cent. of water, 2.5 per cent. of mineral salts, 20 per cent. of cacao butter, 33.5 per cent. of carbohydrates (chiefly dextrin) and 23.5 per cent. of albumin. In cases where the intestine is very sensitive, it is recommended to incorporate into each suppository five drops of tincture of opium. The suppositories, which are well tolerated and of which five should be given daily, develop 46.2 calories each.

Diagnosis of Lead Poisoning.

Sternberg (*Wien. klin. Woch.* through *Journ. Am. Med. Asso.*) remarks that elimination of lead in urine or stool and the blue line on the gums are the most important and obvious signs of lead poisoning, but others are the peculiar worried expression or a drawn smile, anemia, slight tendency to jaundice, dyspepsia, hematuria in the urine, punctate red corpuscles, alimentary dextrosuria and levulosuria, increased blood-pressure and exaggerated tendon reflexes.

Alkaloid in *Eschscholtzia California*.

In *eschscholtzia californica* (California poppy) of Algerian origin, Adam has found considerable quantities of chelerythrine, while Fischer has isolated from a plant of unknown origin, protopine, homochelidonine, chelerythrine and sanguinarine. The presence of these alkaloids in plants grown in France could not be confirmed by Brindejone (*Bull. soc. chim. France*). He was able to isolate an alkaloid, which he has called ionidine, and which was not identical with any of the above. This alkaloid which is present in the air-dried plant to an extent of 0.25 per cent. occurs, when crystallized from alcohol, as colorless, transparent prisms, which melt at 154—156°C. and have the empirical formula $C_{19}H_{25}O_4N_4$. The alkaloid is almost insoluble in water and ether, rather difficultly soluble in alcohol but easily soluble in chloroform. No crystallizable salts could be obtained. Ionidine is a strong base. It yields a colorless solution with concentrated sulphuric acid which is changed to violet by a trace of nitrous acid. With Froehde's reagent an intense violet color, changing to brown, is produced. Injected into frogs the alkaloid exhibited slightly narcotic properties.

Toxicity of Various Arsenic Compounds.

Launoy (*Compt. rend.* through *Rép. de pharm.*) has examined several arsenic compounds as to their toxicity and has obtained the following results, the amounts of the various compounds necessary to kill a guinea pig in from one to ten days being expressed in grammes of arsenic per kilo: Sodium arsenate, 0.006 to 0.0012; sodium sulphoarsenate, 0.00875; sodium sulphoxyarsenate, 0.00991; sodium methylarsinate, 0.00254; sodium sulphomethylarsinate, 0.0256; atoxyl, 0.0418; sulphatoxyl, 0.0221; acetylatoxyl, 0.0462; acetylsulphatoxyl, 0.0266; colloidal arsenic, 0.0083. Sodium cacodylate in doses corresponding to 0.09125 gramme of arsenic, and sodium sulphocacodylate corresponding to 0.0713 gramme per kilo did not kill guinea pigs. The introduction of sulphur into atoxyl and acetylatoxyl doubles the toxicity. The author has also found that guinea pigs which had been treated with sodium arsenate and atoxyl for months succumbed to the lethal dose just as quickly as those which had never been treated with these compounds, thus showing that the animals do not become tolerant of them.

Phenolphthalein as a Laxative.

Koehler (*Schweiz. Woch.*) has made an extended study of the action of phenolphthalein in the various conditions of the intestines and has found that it gives positive results only when the intestinal content is strongly alkaline. By administering to patients *bacillus bulgaricus* and prescribing at the same time vegetable diet, a perfect disinfection of the intestines could be obtained. The stools were of a light color, inodorous and showed an acid reaction. Phenolphthalein administered to such persons did not produce any effect at all. The author believes that the cause of the frequent failure of the remedy when given to children may be due to the fact that the latter are kept mostly on a vegetable diet, and that, therefore, their intestines usually show a neutral or only slightly alkaline reaction.

Similarity Between Nitrite and Acetanilide Poisoning.

A physician after administering liquor sodii phosphatus compositus observed symptoms similar to those occurring in acetanilide poisoning. He sent a sample of the liquor to the *Journal of the American Medical Association*; this was examined in the association laboratory and the result published in the *Journal*, as follows: "Tests which would detect minute quantities of acetanilide failed to reveal the slightest trace of this substance. The odor of the solution was distinctly characteristic of oxides of nitrogen such as are produced in the decomposition of nitrates or nitrites. The presence of a small quantity of nitrate—a regular constituent of this preparation—was detected and also the presence of considerable quantities of a nitrite. Quantitative determinations showed the presence of an amount of nitrite equivalent to 2.9 per cent. sodium nitrite. It seems improbable that a nitrate used in the preparation of this mixture had decomposed to form a nitrite; it is more likely that a nitrite was used inadvertently. If this preparation was given in doses of 8 c.c. (2 fluid drams)—the U. S. P. dose for liquor sodii phosphatus compositus—the patient received 0.2331 gramme or three and one-half times the U. S. P. dose of sodium nitrite."

Anilin Gentian-Violet.

Buhlig (*Quart. Bull. Northwest Un. Med. School*) excludes light and air as much as possible from gentian-violet staining solution. He never filters the solution, nor shakes or otherwise disturbs the bottle. This is practically carried out by putting the solution in a syphon bottle of very dark brown glass. The intake for air is cut down to a capillary bore of such size that will still allow a flow of liquid, and the delivery tube is painted black to the tip with asphaltum paint. The lower part of the intake tube for air is also painted, to be quite certain of excluding light. This arrangement affords convenience as well as assuring a dependable stain.

Shortcomings of Tincture of Iodine.

Referring to the growing use of tincture of iodine for the sterilization of wounds, and of the skin, Holbrook (*N. Y. Med. Journ.*) complains that the official tincture is not so satisfactory as one that contains no potassium iodide. He says that the greater miscibility with water of the official tincture is a negligible advantage in the external employment of the tincture, and that because the potassium iodide causes the tincture to dry more slowly and to spread too easily the presence of the salt is objectionable. He favors a return to the 1890 formula and the renaming of the 1900 product as a compound tincture.

Ptomaines in Vegetable Matter.

Yoshimura (*Biochem. Zeit. through Pharm. Journ.*) has isolated from 1 kilogram of putrefied soya beans about 0.18 gramme of iminazolyethylamine, 0.25 gramme of tetramethylenediamine (putrescine), 0.53 gramme of pentamethylenediamine (cadaverine), 0.23 gramme of trimethylamine and 4.6 grammes of ammonia. Histidine, arginine, and lysine were absent.

Detection of Boric Acid.

Both the flame test and the test with turmeric paper for boric acid are frequently disturbed by the presence of other substances. These products at times color the flame to such an extent as to perfectly mask the green color produced by boric acid. Fellenberg (*Trav. de chim, through Schw. Woch. Chem. Pharm.*) advises to eliminate these substances and for this purpose he recommends the following process, which depends on the fact that boric acid is difficultly soluble in diluted hydrochloric acid, but comparatively easily soluble in alcohol: One gramme of the mixture under examination is dissolved in 2 c.c. (mils) of hot concentrated hydrochloric acid. The mixture is then allowed to cool and to crystallize. In case no crystallization should take place the latter is induced by adding a saturated solution of sodium chloride. The mother liquid is then decanted as much as possible from the crystals and from the latter the boric acid is extracted by boiling with 4 to 6 c.c. (mils) of alcohol. The latter solution is then examined for boric acid in the regular way.

Oil of Peppermint.

Muraour (*Bull. soc. chim. France*) has examined the oil obtained by distilling dry leaves of mentha piperita and has found the following constants: Specific gravity at 15°, 0.911 to 0.913; optical rotation, —38°18 to —40; esters 33.16 per cent. to 40.31 per cent.; total menthol 44 per cent. to 45.6 per cent. This oil, which differs considerably from the true French oil in regard to optical rotation and percentage of esters, and from the American oil in regard to percentage of esters and menthol is very frequently used for adulterating true oil.

Poisoning by Sassafras Oil.

Secretan (*Brit. Med. Journ.*) reports the poisoning of a dog by the application of sassafras oil. The dog had become infested with pediculi, and the oil was applied freely several times within a week. The dog became ill; a veterinary surgeon who was called in told the owner that he thought the dog was poisoned, and that he had seen two similar cases. In all three cases, absorption had taken place through the skin, and not by the dog licking himself. The dog eventually died, about a week after the last application of the oil. The author suggests that in view of the free application of the oil to children's heads, which is now said to be a common practice, it would be interesting to learn if any bad results have been experienced after its use.

Deciphering Writing on Burned Paper.

A contributor to *La Nature* writes that the ashes of a large number of papers have been studied as to the traces left by the ashes of different inks or pencils. All trace of writing made with an ink composed of inorganic coloring matter or of lamp-black, disappears on incineration; while inks containing an iron salt, such as are generally used in Europe, leave a red-brown residue of ferric oxide. In this case the traces of writing become quite visible in the ashes of completely burned paper, and interesting documents, which were accidentally, or intentionally consumed, have been thus reproduced.

Preparing Starch to Use as an Indicator.

Matthieu (*Ann. chim. anal. through Pharm. Journ.*) notes that in using starch as an indicator in end reactions with iodine solutions there is often indistinctness of the terminal point, when the blue color may be evanescent or the color may vary from violet to rose, this variation being due to the presence of dextrin. Further, starch solutions may contain swollen grains, which retain the blue color somewhat persistently, and thus destroy the delicacy of the end reaction. The author, therefore, advises the use of "soluble starch," which he prepares thus: Starch flour is digested for some time with a solution of hydrochloric acid, 1 in 1,000, then washed with distilled water, dried at 30°, and heated for some hours in an oven at about 100°. The weak acid treatment takes out traces of alkaline bases and alkaline earths, and converts neutral phosphates into acid phosphates. When it is submitted to the dry heat its physical state is gradually modified into that of a "soluble starch." The starch thus prepared and dried keeps perfectly. For use as a reagent 1 gramme is dissolved by boiling for a few moments with 100 c.c. (mils) of water and filtering. The resulting solution is very limpid, free from granules, and with iodine is colored pure blue, the blue color being instantly discharged on removal of the excess of iodine. The use of preservatives is condemned.

Making Cloth Waterproof.

For making cloth waterproof Balland (*Rev. Serv. Intend. Mil.*) recommends the use of commercial aluminum acetate, having found that fabrics treated with this chemical withstand water just as well or even better than those which have been treated with caoutchouc, gelatin, boiled linseed oil, paraffin, aluminum stearate, aluminum sulphate, etc. The old process of producing aluminum acetate on the fiber by the action of a solution of lead acetate on a solution of alum does not give as satisfactory results, according to the author, as those obtained by the use of commercial aluminum acetate, which is used extensively as a mordant in dyeing cotton and in printing fabrics. The process is a very simple one. One liter of this chemical, which is marketed as a liquid of 6 to 7° Bé, is mixed with 40 liters of water and the cloth is allowed to remain in this mixture for 24 hours. After draining well, it is dried in the air.

Detection of Colchicine.

Zeisel's method for the detection of colchicine in toxicological examination has been modified by Fuehrer (*Arch. exp. Pathol.*) in the following way: 3 to 5 c.c. (mils) of the liquid under examination are heated in a boiling water-bath for a half hour with 5 drops of diluted hydrochloric acid (15 to 20 per cent). While still hot, ferric chloride solution is added until a green color is no longer produced. After cooling, the mixture is shaken with one-third or one-fourth its volume of chloroform, when the latter will become colored yellow to garnet-red, the intensity of the color varying with the amount of colchicine present. When the solution contains more than 2.5 milligrammes of colchicine the chloroform will acquire a brown color. In order to obtain the characteristic garnet-red coloration the solution before testing should be diluted properly.

Antagonism of Adrenalin and Strychnine.

Falta and Jvcovie (*Berlin klin. Woch. through Pharm. Journ.*) found that if the exposed heart of a frog is poisoned by dropping on its surface 3 or 4 drops of a 2-per cent. solution of strychnine nitrate, after twenty to thirty seconds the frog gives evidence of general tetanus. The heart contracts with difficulty and finally stops in diastole. If 2 or 3 drops of a 1-per cent. solution of adrenalin is then applied to the heart, it begins to beat again and the rate in time exceeds that of the normal frog's heart. Experiments were also conducted with guinea-pigs, strychnine and adrenalin being injected into the abdominal wall. In many cases the two substances were mixed. These experiments showed that 1.6 milligrams of strychnine alone killed within thirty-seven minutes, and 3.2 milligrams killed in ten minutes; 4 milligrams of strychnine mixed with 0.6 milligram of adrenalin did not produce symptoms, but larger doses of strychnine, or smaller doses of adrenalin, were followed by death. The authors regard adrenalin as a powerful antidote to strychnine.

Pæmol.

Arboreous peony (*pæonia arborea*), a ranunculaceous plant, called in China montan and in Japan botan, is used as an antispasmodic. Martin and Jagi have isolated from it a substance possessing a very agreeable odor, which they have called pæmol. It crystallizes in needles, melting at 48—50°, is chemically the methylester of resacetophenone and gives a red-violet color with iron chloride solution. Penon (*Journ. pharm. chim.*) has found that pæmol is not preexistent in the drug, but that it is formed by the action of a ferment in the drug on a glucoside. The sugar obtained by this hydrolysis could be identified as glucose. The glucoside, according to the author, is also hydrolized by diluted mineral acids, but not by invertin or emulsin.

Poisoning by Oleomargarin.

A few months ago numerous persons in the city of Hamm (Germany) were afflicted by serious gastrointestinal troubles, the origin of which was traced to the use of oleomargarin, prepared by a certain factory. Dunbar (*Deutsch. med. Woch.*) has found that the fat was free from metallic salts and alkaloids, but that it contained 50 per cent. of so-called "cardamom fat," a product which, however, is not prepared from cardamom seed, but from hyduocarpus seed, and which is marketed under the name "Maratti fat." Plücker (*Unters. Nahr. u. Genussm.*) has since examined the oleomargarin referred to and found that the poisonous substance is a non-volatile fatty acid, which is identical or nearly related to crotonic acid and curcas acid. These acids must be considered as the poisonous principles in croton oil and in the oil of *jatropha curcas* var. *curcas purgans*.

Lead in Tartaric Acid.

Guérin (*Ann. d'Hyg. publ.*) has examined eight samples of commercial tartaric acid and has found each one to contain lead, the amount ranging from 0.00536 to 0.0136 per cent. The author therefore recommends to carefully examine tartaric acid for this metal.

The Modern Materia Medica.

Agarase is a preparation of agar-agar and the lactic ferment.

Albumozo is said to contain casein, fat and inorganic salts, partly phosphates.

Alypinoids is the name for tablets containing alypin and suprarenin.

Atrophan is 2.phenylquinoline.4.carbonic acid.

Avantol is a cresol-sulphonic acid solution which seems to be almost identical with *sanatol*.

Casogen, a nutritive preparation, contains milk-protein, glycerophosphates and ovo-lecithin.

Digitalis Winckel is the name for powdered digitalis leaves which have been dried by a special process in order to destroy the enzymes, which, in the ordinary drying process, are said to exert a hydrolytic action on the active principles.

Epinine, a synthetic product, is 3.4.dihydroxy-phenylethylmethylamine, which is said to possess all the physiological properties of the suprarenal principle acting similarly to this on the blood pressure, heart, etc.

Erepton, put forward as a material for rectal feeding, is obtained by a pancreatic digestion of lean meat. It occurs as brown scales or granules and possesses an odor suggesting yeast.

Fructoid is a fruit-jelly containing phenolphthalein.

Gayatin is a liquid containing ammonium guaia-colsulphonate.

Gyssoplasma is similar in action to antiphlogistin.

Helmitoloids are tablets containing helmitol.

Hydropsin is a name for a preparation said to contain the juice of fresh squill, honey, potassium borotartrate, and tincture of gentian.

Iod-Asklerosin Tablets contain blood salts in which the calcium is replaced by effervescent citrate of magnesium. Each tablet also contains some sodium iodide. They are put forward for the treatment of arteriosclerosis.

Lecisan Oil, a nutritive preparation, is said to contain lecithin, vitellin, maltose, and lactose.

Matrival is a weak alcoholic extract of German chamomile and valerian.

Meningit is the name for tablets containing rhubarb, aloes, senna, cascara sagrada, capsicum and various other drugs.

Pectinal is a 2 per cent. emulsion of oil of pinus sylvestris.

Siccoliment is the name for vasoliments containing either iodine, camphor-chloroform, salicylic acid, or ichthyol.

Stenosine is disodium methylarsinate.

Streptococcus Vaccine is a vaccine prepared from micrococcus rheumaticus (Paine and Poynton).

Thiopetrol is an emulsion containing sulphur and petroleum. It is put forward for the treatment of dandruff and alopecia.

Wa-ka-na, a Japanese preparation for rheumatism, consists chiefly of camphor.

Wolominth is an alcohol-free mouth and gargle water containing oil of peppermint and salol.

Aromatic Perles.

These pearls or pastilles are to be used in linen closets, chiffoniers, etc., in lieu of sachet powders.

Amber	2 grammes.
Benzoin	10 grammes.
Orris	6 grammes.
Vanilla	1 gramme.
Cloves	1 gramme.
Cinnamon	1 gramme.
Oil of neroli.....	6 grammes.
Oil of citron.....	1 gramme.
Oil of rose.....	1 gramme.
Mucilage of tragacanth.....	enough.
Glycerin	enough.

The solids are to be reduced to a moderately fine powder, mixed intimately, and made into boluses with the mucilage and a little glycerin. The pearls are then to be wrapped in parchment paper and gilt foil.

Oriental Toilet Water.

Spirit of pimento.....	36 c.c. (mils).
Tincture of benzoin.....	36 c.c. (mils).
Tincture of tolu.....	36 c.c. (mils).
Tincture of ambrette.....	54 c.c. (mils).
Tincture of orris.....	48 c.c. (mils).
Tincture of tonka.....	16 c.c. (mils).
Oil of cloves.....	2 c.c. (mils).
Oil of geranium.....	2 c.c. (mils).
Lavender water.....	200 c.c. (mils).
Cologne water.....	200 c.c. (mils).
Acetic ether.....	15 c.c. (mils).
Rose water.....	25 c.c. (mils).
Alcohol	300 c.c. (mils).

Lotion Vegetale au Seringa.

Durville gives the following formula for this popular hair lotion:

Tincture of vanilla.....	200 grammes.
Tincture of cantharides.....	20 grammes.
Terpineol	10 grammes.
Oil of rose geranium.....	1 gramme.
Oil of ylang-ylang.....	1 gramme.
Heliotropin	2 grammes.
Alcohol	2000 c.c. (mils).
Water	80 c.c. (mils).

"White" Soft Soap.

Coconut oil.....	43 grammes.
Potassium hydroxide.....	7 grammes.
Alcohol	100 c.c. (mils).
Distilled water.....	50 c.c. (mils).

Dissolve the hydroxide in the alcohol. Add the oil, little by little, with constant stirring. Recover the alcohol by distillation at a minimum temperature. Add the water to the residue.

Perfume for Talc Powder.

Oil of neroli.....	2 c.c. (mils).
Oil of cloves.....	1 c.c. (mil).
Oil of bergamot.....	2 c.c. (mils).
Oil of rose geranium.....	2 c.c. (mils).
Oil of sandalwood.....	1 c.c. (mil).
Oil of lavender (old).....	1 c.c. (mil).

Notes and Queries.

NOTICE.—It is desirable that all questions to be answered under this head should be received before the fifteenth of the month and they must be accompanied with the name and address of the writer.

Queries are not answered by letter. The information supplied in these columns is intended for the benefit of our readers in general, not for the profit of the individual inquirer only.

Making Tincture of Nux Vomica.—C. H. W., District of Columbia, writes:

1. Why does the Pharmacopœia in the case of tincture of nux vomica require the tincture to be prepared from the powdered extract?

2. Why would not a tincture prepared from the fluid-extract be equal in every particular to the tincture prepared from the powdered extract, bearing in mind that the fluid-extract is standardized in the same manner that the powdered extract is?

3. Why would not a standardized tincture prepared from the crude drug, answering as it would all the requirements of the Pharmacopœia, be equal to the U. S. P. tincture?

1. This question is answered by the United States Dispensatory. The change in the official directions for making tincture of nux vomica were made by the committee which revised the 1880 Pharmacopœia and issued the 1890 edition. In the former the use of the crude drug was directed and in the latter, the use of the extract. The eighteenth edition of the United States Dispensatory, commenting on this change, says:

The object of the U. S. 1890 process is to secure a more reliable and definite tincture than was possible under the old process; for this reason 2 per cent. of the standardized extract is directed to be dissolved in a mixture of 3 volumes of alcohol and 1 volume of water. On account of the very tough structure of nux vomica, percolation is accomplished usually with varying results.

It may be said, however, that a number of the foreign Pharmacopœias direct that the tincture be prepared direct from the seed. This is true of the German, French, Hungarian, and Spanish pharmacopœias, but not of the British.

2. This opens up the old question as to the advantages or the reverse of making tinctures of fluid-extracts—a practice in wide vogue but one which has not received the sanction of the best pharmacists. One reason the best pharmacists do not sanction this practice is that on account of the difference usually existing between the menstrua of fluidextracts and tinctures of the same drugs, precipitation often ensues when the former are diluted to make the latter.

3. We are unable to answer this question. We believe that a tincture answering all the requirements of the Pharmacopœia would be equal to the pharmacopœial tincture. However, in these days of stringent drug laws which uphold the authority of the Pharmacopœia, it is well for the dealer in drugs to be sure that his goods really do answer the requirements of that work.

And now that we have answered our querist's questions categorically, we may add a little historical note of our own which should throw a side-light on the matter:

When the 1880 Pharmacopœia was in course of preparation there was no practical way known by which the strength or quality of nux vomica could be determined. After giving directions for making the tincture from the crude drug, so that each 100 parts of tincture should contain 2 parts of dry extract, that book said: "Tincture of nux vomica thus pre-

pared represents about 20 parts of nux vomica in 100 parts." Nothing was said about the alkaloidal strength of the preparation, although as a matter of fact some nux vomica seed are poor in alkaloids and rich in extractive, while others are just the reverse.

About a year after the publication of the 1880 Pharmacopœia, Dunstan and Short reported to the British Pharmaceutical Conference (see the issues of THE DRUGGISTS CIRCULAR for August, 1884, page 116, and September, 1884, page 131 to 133) a series of experiments made by them which showed the great variation in alkaloidal strength of nux vomica seed, and out of this work grew the change made in the British official formula for tincture of nux vomica. A similar change was later made in our own Pharmacopœia, largely, no doubt, on account of a paper read at the 1885 meeting of the Michigan Pharmaceutical Association by Dr. A. B. Lyons—or, at least, on account of facts set forth therein—which paper appears in full in the CIRCULAR for December, 1885, page 252. The three pharmaceutical chemists named, as well as others, showed that a tincture standardized according to its alkaloidal strength, rather than according to its extractive, was not only feasible but decidedly preferable. Another factor which no doubt influenced the decision of the revision committee to make in our 1890 Pharmacopœia the change noted, was a law-suit instituted about the time this committee was beginning its work. This suit was one brought by the food and drug commission of New Jersey, against a druggist of Atlantic City, Henry Leeds, for selling a tincture of nux vomica, made from a standardized "normal liquid," which did not yield the required 2 per cent. of extractive. Parke, Davis & Co., whose "normal liquid" had been used, defended the suit, and introduced witnesses who testified that the intent of the Pharmacopœia makers was better complied with by a tincture made from the "normal liquid" than by one made from the seed, even though the designated amount of extractive might be lacking in the latter. Among these witnesses were Prof. J. P. Remington, Dr. H. H. Rusby, Dr. R. G. Eccles, Dr. H. A. Hare, Dr. John Marshall, and Prof. F. G. Ryan. In spite of all this, however, the case went against Mr. Leeds. In commenting on this outcome the CIRCULAR said: "The committee of revision can scarcely fail to provide in the new Pharmacopœia for the standardization of nux vomica tincture." For a full account of this trial, see the issues of the CIRCULAR for February, 1891, page 30, and March of the same year, page 73 and 94.

Tincture of Canadian Castor.—J. S. K., Connecticut.—This is a tincture made from castor (castoreum) obtained from the American beaver. Tincture of castor is used principally in hysteria, in doses of from ½ to 2 ounces, and then more for its psychic effect (according to Hare) than on account of any sedative property it may possess. It is official in France, the Codex of that country saying that the American (Canadian) castor is preferred to the European (Russian) variety. The formula for the tincture is, 10 grammes of castor in coarse powder and enough 80% alcohol to make 100 grammes; macerate for 10 days in a closed vessel with frequent agitation, express and filter. On account of its resinous nature it is incompatible with aqueous liquids.

The drug and its tincture are described in the usual text-books, including the dispensatories.

"Extract of Blodgetti."—L. G. S., North Carolina, asks if the "extract of blodgetti" mentioned in the pamphlet, *Consumption Cure Fakes*, issued by the American Medical Association, is the same "extract of blodgetti" exposed as a humbug in the CIRCULAR fifty-two years ago, as mentioned in an editorial note in the March issue, page 122. Our querist remarks that as the name "blodgetti" is a fictitious one it seems strange that a nostrum faker should adopt it more than half a century after it had been exposed as simply bait for suckers.

It does seem strange, but as "there is a sucker born every minute" doubtless there are many who will grab at the bait. There must be some psychologic influence about the sound of the word, or its appearance in type, which makes it attractive to fakers, and maybe to suckers, too, for although we have many new names for fake stuff to be used in free prescriptions, our old acquaintance still holds its place.

Looking back rather hastily over the files of the CIRCULAR we find in 1909 that a post-office fraud order was issued against a concern exploiting "blodgetti"; in 1905 and 1906 the "confidence game" of the "Rev. Wilson" showed new life and we had a few words on the subject; in 1889 we answered a query about this fictitious extract; in 1885 (October) we printed in full the fake prescription calling for "extr. of blodgetti" which brought out alleged formulas for "blodgetti" from a number of correspondents who differed considerably among themselves, some even saying that "blodgetti" was a popular synonym for galangal (November and December). In 1869 (March, page 58) the CIRCULAR said: "The dust raised by the queer articles in the pretended formula is designed to conceal its swindling character. Wilson is like the cuttle-fish—little except ink is seen where he operates. It is surprising to us that he has been able to hold out in his unwarrantable practices so long." In 1862 (November, page 168) is a column article in which the "Rev. Wilson" is flayed in the most scathingly sarcastic manner. In 1859 (October page 229) appears the following item, under "Notes and Queries," which seems to be the first mention made in the CIRCULAR of the name under discussion:

C. J. G., (Canton, O.)—We have had a number of inquiries about the same matter, and have tried to find out the Rev. Edward A. Wilson at Williamsburgh, but without success. We consider both him and the extract of blodgetti an unmitigated humbug.

At the 1908 meeting of the American Pharmaceutical Association Dr. Lyman F. Kebler read a paper entitled "Prescription Nostrums," in which he made some extended references to this matter. His paper appears in the Proceedings for that year, page 570.

Liniment Formula.—Joseph H. Milo, New York, contributes the following formula for a liniment:

Tincture of iodine.....	4 drams.
Tincture of opium.....	4 drams.
Tincture of aconite (35%).....	2 ounces.
Tincture of capsicum.....	2 ounces.
Chloroform	2 ounces.
Soap liniment.....	10 ounces.

Attach a shake label.

We thank Mr. Milo for his formula, which we hope will be found of service to our readers.

Perhaps this formula may be of service to our querist C. C. G., Pennsylvania.

Piano Polish.—A. B. R., New York.—In introducing an extended note on this subject, embracing many formulas, in the CIRCULAR for January, 1910, page 20, we said:

So frequently have we printed formulas for preparations of this kind that one of our friends has poked fun at us for the large amount of attention bestowed upon the matter, and asked us if we could not find something better to fill the space. However, you want the formula for a fixture cleaner and polisher, and as you have applied for help at the place which makes a specialty of aiding all those who seek light on pharmaceutical and allied subjects, we shall not send you away empty-handed, no matter what the scoffers may say: our idea is to run this department for the benefit of those who need it, not for the know-it-alls. If anybody does not see in it what he wants he is requested to ask for it.

And more recently, that is to say, in the CIRCULAR for December, 1910, page 636, we said:

Perhaps the best method for polishing pianos, carriage or automobile bodies, and other high-gloss varnished surfaces is to go over the varnish first with a pledget of absorbent cotton saturated with kerosene. Then go over it with a piece of chamois leather dipped first in olive oil and then in finely powdered and bolted rotten stone, using a circular movement. Wipe off the rotten stone with the palm of the hand moving in a rotary direction and wiping off the hand after each rotation; and then go over the surface with a piece of chamois saturated with olive oil. Finally wipe dry with a piece of soft silk.

The formula calling for acetic acid and butter of antimony, to which you refer, appears in the first-mentioned note, and is as follows:

Mahogany Polish.

Hydrochloric acid.....	2 drams.
Butter of antimony.....	12 drams.
Alcohol	12 drams.
Linseed oil.....	4 ounces.
White wine vinegar.....	8 ounces.
Mix in the order given.	

Malted Milk.—D. L. C., Georgia.—In an article on baby foods in the CIRCULAR for June, 1909, page 296, we stated that we had seen the following formula for "malted milk." This powder is to be added to the milk, the proportions not being stated, and the liquid evaporated and powdered if a dry product is desired:

Powdered malt.....	1 ounce.
Powdered oatmeal.....	2 ounces.
Sugar of milk.....	4 ounces.
Roasted flour.....	1 pound.

It has been stated that the first malted milk was produced by Liebig who in 1867 took out a patent on a food product made as follows, according to Pharmaceutical Formulas:

Fresh skimmed milk.....	12,458¼
Wheat flour.....	720
Water	1,440
Ground malt.....	720
Potassium bicarbonate.....	21¾

Mix the milk and flour, and boil for five minutes; then cool to 150° F., add the other ingredients, and maintain the heat for one-and-a-half hours. Finally boil for two minutes, strain, evaporate and powder.

Headache Cologne.—S. C. W., New Jersey.—When you wrote you had not received the April issue of the CIRCULAR, on page 195 of which there is a note on this subject.

Tooth Paste Formula.—T. P. P., District of Columbia.—We do not know the formula of the tooth paste you mention. Why not devise a formula of your own? Many helps for those who wish to do this are given in the CIRCULAR from time to time. One of a half dozen or more formulas for tooth pastes in the CIRCULAR for May, 1909, page 235, is here offered, to be used as a basis for any experiments which you may wish to make in devising a satisfactory formula:

Precipitated chalk.....	14½ ounces.
Powdered soap.....	2½ ounces.
Glycerin	18 drams.
Water	20 drams.
Powdered sugar.....	4 drams.
Solution of sodium hydroxide....	3 drams.
Saccharin	3 grains.
Thymol	7 grains.
Oil of peppermint.....	15 minims.
Oil of cinnamon.....	15 minims.

Other formulas may be seen in the issues of the CIRCULAR for February and December, 1910, pages 74 and 634, respectively; and for September, 1909, page 456.

Artificial Maple Syrup.—"Druggist," Massachusetts.—We do not approve of imitation products, but as there is a much greater demand for maple syrup than there is maple syrup with which to fill it, there may be a legitimate use for artificial syrups when they are not sold for and as the genuine. Artificial or adulterated foods which are not in themselves harmful, are objectionable when they are misbranded. For instance, oleomargarin is held by some people to be as good as butter, but when we buy butter we do not wish oleomargarin palmed off on us. Neither do we wish flavored glucose when we buy maple syrup, but if we cannot get maple syrup perhaps we could be induced to try the substitute, with the full knowledge that it was a substitute, just as we might prefer oleomargarin to eating our bread dry.

It is said that artificial maple syrup may be made by boiling simple syrup and adding, while it is cooling, 4 ounces of the inner bark of hickory to the gallon. Another way to make this syrup is by boiling glucose with maple chips.

A correspondent of the CIRCULAR says: "I have used the following, which will deceive good judges of the genuine, and at the same time be harmless:

Red corn cobs.....	4
Water	2 pints.
Light brown sugar.....	enough.

"Boil the cobs in the water until the latter is quite red, strain and add sufficient sugar to make a heavy syrup. When cold the flavor is very pleasant to the taste."

A manufacturing chemist writes us: "A tincture of guaiac wood, made with 20 per cent. alcohol, makes a good maple essence. A little vanillin and oil of lemon may be added to improve it, but I have known 'barrels of money' to be made on the guaiac alone."

Of course, it would be rank fraud to sell syrup so made as genuine maple syrup.

"Each year in the city of Chicago alone more 'pure Vermont sugar and syrup' has been made than could be produced by all the trees in the Green Mountain State if they ran sap all the year round. But there

is a pure food law now." So reads a portion of a press dispatch from Bennington, Vt., announcing the opening of the maple syrup season, and in Farmers' Bulletin No. 252, issued by the United States department of agriculture, we read: "In spite of the well-known fact that the demand for maple sugar and syrup has increased and is increasing enormously every year, the price of both sugar and syrup has steadily declined—from 13 cents a pound for sugar and \$1.25 a gallon for syrup in 1882; to 11 cents a pound for sugar and 91⅔ cents a gallon for syrup in 1903. Meanwhile the census returns show that the actual production of the groves has not increased since 1860."

Sabadilla for Body Lice.—E. L. P., New Hampshire, has calls for something which the "lumber jacks" pronounce "sebidella," as near as he can make it out. They say they want it for use against body lice. Our querist thought perhaps they wanted red precipitate, but they said not. He asks us for help in interpreting their wishes.

We guess sabadilla or cevadilla or, as the Germans write it, läusekörner, which is used in the shape of powder, ointment or decoction to destroy vermin. The United States Dispensatory refers to a pulvis capucinorum, of which sabadilla is the principal ingredient, in use in Europe for the destruction of lice in the hair. A formula for this powder is given in the CIRCULAR for June, 1910, page 282.

Sabadilla is very poisonous and is said to have caused death when applied on a scalp that was ulcerated. It may be absorbed in toxic quantities through the lacerations of the skin caused by scratching.

Liquid Glue.—T. R., Ohio.—We do not know the processes for making the two glues that you specify, but in a general way we may say that liquid glues generally depend for their fluidity upon acetic or phosphoric acid. A typical formula follows:

Glue	200 parts.
Diluted acetic acid.....	400 parts.
Alcohol	25 parts.
Alum	5 parts.

Dissolve the glue in the acid by the aid of heat, and to the solution add the alum and alcohol.

A number of other formulas appear in the CIRCULAR for last month, page 206; and a miscellaneous collection of formulas for adhesives may be seen in the issue for November, 1907, page 731.

Vilane.—"Quinine," New York.—This is one of the fakes whose advertisements appear among the "pure reading matter," as advice from the editor or some "beauty specialist." Such an advertisement of vilane appeared in a Fort Madison (Ia.) paper, in which it was declared that a "local druggist is authority for the statement," etc.; and next day there appeared in the same paper a real statement signed by every druggist of the town, which while not in exactly this language was to the effect that the editor and publisher of the paper had lied for pay for the purpose of deceiving their readers, and in so doing had besmirched the character of the local druggists.

A note on this subject appears in the CIRCULAR for last month, page 233.

Aromatic Fluidextract of Cascara Sagrada.—L. D. S., New York.—This is an official preparation, the formula for it being in the United States Pharmacopœia. Drugs sold under an official name should be of official strength, quality or purity.

George M. Beringer has devised a set of formulas for fluidglycerates, which appears in the CIRCULAR for November, 1908, page 549. From Mr. Beringer's paper the following excerpt is taken:

Bitterless Fluidglycerate of Cascara Sagrada.

Cascara sagrada, in number 20 powder. 100 grammes.
Lime 5 grammes.

Mix the lime with 200 c.c. [mils] of distilled water and stir in the cascara sagrada, moistening the drug evenly and thoroughly. Dry the moist powder by exposure to a moderate heat until air dry, then proceed with this as directed in the type process, using 80 c.c. [mils] of the glycerol-water menstruum to moisten the drug.

The resulting product is deep red-brown in color, bitterless, entirely free from sediment, and quite satisfactory. It mixes clear with water, syrup, or diluted alcohol, and cloudy with alcohol.

Aromatic Fluidglycerate of Cascara Sagrada.

Bitterless fluidglycerate of cascara
sagrada 75.0 c.c. [mils.]
Fluidglycerate of glycyrrhiza..... 25.0 c.c. [mils.]
Oil of fennel..... 0.1 c.c. [mil.]
Oil of cloves..... 0.1 c.c. [mil.]
Oil of cassia..... 0.1 c.c. [mil.]
Mix.

This is an excellent aromatic preparation in which the bitter taste of cascara is effectually disguised.

Type Process.

The type process referred to above is as follows:

The drug in coarse powder..... 100 grammes.
Glycerin 50 c.c. [mils.]
Distilled water..... 150 c.c. [mils.]
Chloroform water..... to make 100 c.c. [mils.]

Mix the glycerin and distilled water and moisten the drug thoroughly with a sufficient quantity of the mixture and then pack it very lightly in a cylindrical percolator and saturate thoroughly with menstruum; cork up and cover the percolator, and allow to macerate for two days, then continue to percolate until the drug is exhausted, using first the remainder of the menstruum and then chloroform water. Reserve the first 50 c.c. [mils] of percolate and set this aside. Evaporate the remaining percolate on a water bath, the weaker portion first, then the stronger until reduced to 60 c.c. [mils], and then add the reserve and continue the evaporation until the product measures 100 c.c. [mils]. If evaporation has been carried too far, make up to 100 c.c. [mils] with distilled water. Set the product aside for several days to settle; decant the clear supernatant layer, and strain the remainder through muslin.

Other notes on this subject, with formulas, appear in the issues of the CIRCULAR for February and April, 1909, pages 68 and 183, respectively; and June, 1908, page 267. A Canadian formula is given in the issue for November, 1905, page 393. See also the note on "Bitterless Fluidextract of Cascara Sagrada" on this page.

Bitterless Fluidextract of Cascara Sagrada.—F., California.—This being an official preparation, deviations from the official formula as given in the National Formulary should not be made except in circumstances which justify such deviations both morally and legally.

Some years ago the CIRCULAR printed the following process for making a fluidextract of cascara which is active and yet free from bitterness: One kilogram of the bark, in coarse powder, is treated with hot water, and the liquid expressed after six hours of maceration; and the operation is repeated, enough

water being used in all to yield about 2.5 liters. The liquid is mixed with 200 c.c. (mils) of ammonia water, and concentrated to 800 c.c. (mils). No ammoniacal odor should then be given off, and, after cooling, milk of lime is added until the alkaline reaction is persistent. After standing four days and being shaken frequently the liquid is filtered. It should still be alkaline. The milk of lime has precipitated the emodin and the bitter constituent. A little tartaric acid is then added to precipitate the excess of lime, and the whole is allowed to stand eight days, when it is filtered again. The extract should now possess no bitter taste. Finally, 200 c.c. (mils) of alcohol are added as a preservative.

Another process for making a bitterless fluidextract of cascara sagrada appears in the CIRCULAR for February, page 74. A note on this page under the head "Aromatic Fluidextract of Cascara Sagrada" may also prove of interest in connection with a study of this subject.

Separation of Water from Ointment of Rose Water.—F. W. Scott, Jr., New York, is a man of practical ideas about many pharmaceutical affairs, and seems to be especially keen about those which concern toilet articles. He writes:

"I have often been annoyed to find drops of water had separated from my U. S. P. cold cream and it had lost that nice homogeneous appearance it had when first made. This was particularly noticeable in warm weather. By using an equal weight of powdered castile soap in place of the sodium borate I have overcome this annoyance."

Of course, any preparation "sold under or by a name recognized in the United States Pharmacopœia or National Formulary" should not differ from the "standard of strength, quality or purity as determined by the test laid down in those books."

We thank Mr. Scott for his note, which we feel will be helpful to many of our readers.

Florida Water.—F. W. Scott, Jr., New York, is kind enough to contribute the following formula for a Florida water which, he says, is pleasing and at the same time inexpensive:

Oil of cassia.....	0.50 c.c. (mil).
Oil of bergamot.....	2.50 c.c. (mils).
Oil of lavender.....	2.50 c.c. (mils).
Oil of lemon.....	2.00 c.c. (mils).
Menthol	1.25 grammes.
Talc	enough.
Alcohol	550.00 c.c. (mils)
Water....	enough to make 1000.00 c.c. (mils).

Dissolve the oils and menthol in the alcohol; add the water in several portions, stirring well after each addition. Stir in a small quantity of talc, and filter. The water improves with age, and the best results follow the use of an oil of lavender that is at least a year old.

Almond Cream.—V. B. R. S., Illinois.—A formula for a rose-almond cream may be seen in the CIRCULAR for March, page 128; and one for an almond bleaching cream appears in the issue for February, page 86. In the issue for November, 1910, page 576, is a formula for a plain almond cream, and scattered through the volume for 1908 are several others.

Liquid Court Plaster.—P. L. M., Pennsylvania.—While the exact process employed by any particular manufacturer in making liquid court plaster is unknown to us, we may say that in a general way most preparations of this kind have a sort of collodion base. Many notes on the subject, with formulas, have appeared in the CIRCULAR during the past half dozen or so years, as may be seen by reference to the numbers for September, 1909, page 454; August, 1907, page 549; February, 1906, page 53; August, 1905, page 281; and August, 1904, page 184.

If soluble gun cotton is dissolved in acetone in the proportion of about 1 dram by weight of the former to 35 or 40 drams by volume of the latter, and $\frac{1}{2}$ dram each of castor oil and glycerin be added, a colorless, elastic and flexible film will form on the skin when the liquid is applied. Unlike ordinary collodion this preparation does not readily peel off. If tinted very slightly with alkanet and saffron it can be made to assume the color of the skin so that when applied it is almost invisible.

It is said that a mixture of warm solution of sodium silicate and casein, about 9 parts of the former to 1 part of the latter, gelatinizes and forms a sort of liquid court plaster.

A portion of the note in the August, 1905, issue is here quoted:

The proportions of alcohol and ether for a pyroxylin-solvent may be varied within wide limits and the relative quantity of pyroxylin used is to be determined by the viscosity required. Suitable proportions are 100 volumes of ether to 40 volumes of alcohol (preferably absolute). Other solvents of pyroxylin are acetone (and homologues), various simple ethers, esters, camphor in absolute alcohol, etc. For epidermic application the ether-alcohol collodion is the best liquid; it evaporates so quickly that a few minutes suffice to apply several successive coatings to strengthen the film, which is most adherent. Pyroxylin in various simple or compound solvents, alone or associated with oily, resinous, or pigmental bodies, or incorporated with a suitable modifying agent, as for example camphor, may be used as a thin lacquer, a thick varnish, or a plastic solid.

As a working formula the following may be found useful:

Pyroxylin	1 ounce.
Amyl acetate.....	5 ounces.
Acetone	15 ounces.
Balsam of fir.....	2 drams.
Castor oil.....	2 drams.
Oil of cloves.....	15 minims.

Dissolve the pyroxylin in the amyl acetate, and the acetone, and add the other ingredients, avoiding fire, or light.

Ovoferrin.—T. R., Ohio.—According to Modern Materia Medica, a very valuable little condensed dispensatory of the more recent drugs and preparations, "ovoferrin is a reddish-brown, nearly odorless, slightly aromatic 5 per cent. solution of an organic iron compound, 'synthetic iron vitellinate,' to which the formula $C_{47}N_{17}SH_5FE_8O_{22}$ has been assigned." The same book is authority for the statement that each tablespoonful of this preparation is equivalent to 1 grain of elementary iron, and that it contains about 9 per cent. of alcohol.

A somewhat longer note, based upon an examination of ovoferrin made in the laboratory of the American Medical Association, appears in the CIRCULAR for September, 1910, page 472.

Sodium Cacodylate.—"Hospital Apothecary," New York, writes:

Kindly publish the therapeutetic uses of sodium cacodylate, doses, etc. One or two of our physicians have used it in Europe in clinics, and I want to get more information on its latest methods of use and dosage. A dose of $\frac{1}{2}$ to 2 grains is accepted as fair, but we are giving 3 grain doses in nervous cases with apparent good results. It being an arsenical derivative and one of the comparatively new remedies, its use is not entirely covered in standard works.

Literature.

Sodium cacodylate, which is the salt of cacodylic acid most used, is official in France but not in Germany, Spain, Great Britain, Hungary, or the United States. It is described at some length in the British Pharmaceutical Codex; and each of our dispensatories devotes a paragraph to it. Sollman, in his Text-Book of Pharmacology, briefly sums up its properties and uses. In 1900, 1901, and 1902 the reporter on the progress of pharmacy for the American Pharmaceutical Association included many notes and references to cacodylates in his abstracts from foreign journals. These authorities have been drawn upon for much of what follows. Clinical reports appear in current medical literature.

Physical Properties.

The salt in question is white, odorless, tasteless and deliquescent. It occurs in prismatic crystals or as an amorphous powder, different specimens differing in appearance according to the temperature at which they were crystallized and the nature of the solvent used, and contain varying proportions of water of crystallization. Of the latter, commercial varieties usually contain 2 or 3 molecules. The salt is soluble in one-half its weight of water, and in its own weight of alcohol.

Therapeutics.

The arsenic in sodium cacodylate is so combined that it does not produce directly, when the salt is used medicinally, the characteristic arsenic action. Sodium cacodylate is therefore much less toxic than the ordinary arsenic salts, and correspondingly less active therapeutically. In 1901 Heffner said that its superiority over ordinary arsenic was not established, and, if it had any such superiority it was due to its slow liberation of arsenic. This was quoted with approval by Sollman, in 1906, and the latter added that since such liberation occurs readily in the stomach, the better way to administer the drug is hypodermically in doses of from 1 to 3 grains a day, or intravenously.

On account of the alliaceous odor developed when taken by the mouth, and for other reasons, sodium cacodylate is sometimes administered in the form of an enema. A weak injection is made by dissolving 25 grammes of the salt in 200 c.c. (mils) of water; while a strong injection contains 40 grammes in the same quantity. The dose of these is 5 c.c. (mils) twice a day, in certain limitations.

The drug is indicated in tuberculosis, anemia, diabetes, chloroses, certain affections of the skin, etc., but should always be administered with great care, as its by-effects are sometimes disastrous.

Chemistry.

Cacodylic acid is monobasic, its molecular weight is 138, and it contains 54.3 per cent. of arsenic, equivalent to 71.7 per cent. of arsenic trioxide. Sodium cacodylate has the formula $(CH_3)_2As.O(ONa)$, its molecular weight is 160, and it contains 46.0 per cent.

of arsenic, equivalent to 61.8 per cent. of arsenic trioxide.

When pure and dry, 100 parts of cacodylic acid require 28.99 parts of sodium hydroxide for saturation. When lime water is added to a solution of the acid or its salts a precipitate indicates the presence of oxalates, arsenites and arsenates. The sodium salt should give no precipitation with silver nitrate, or at most only a slight turbidity.

Cacodylates give the following color reactions: with cupric sulphate, blue; with cobaltous chloride, rose-red, changing to violet and blue; with nickel nitrate, light green; with mercurous nitrate, yellowish; with mercuric nitrate, white, becoming yellow when heated, but not brown; with neutral lead acetate, faint whitish turbidity; with ferrous sulphate, no precipitate in the cold, but a green-blue one when heated; with ferric sulphate, no reaction in the cold, but a blood-red color on heating, which persists on cooling; with silver nitrate, a white, slimy precipitate.

Pharmacy.

Before dispensing sodium cacodylate with other ingredients, it is well to make sure that it contains no free alkali; any of the latter found to be present should be neutralized with cacodylic acid, otherwise, for instance, when mixed with iron, it may cause precipitation of ferric hydroxide.

In the CIRCULAR for February, 1910, page 66, the following formula for making a satisfactory pill mass of sodium cacodylate is given:

Sodium cacodylate.....	3 parts.
Powdered tragacanth.....	1 part.
Powdered sugar.....	2 parts.
Wheat flour.....	6 parts.
Water	enough.

Mix vigorously.

The finished pills are to be rolled in a little powdered talc.

It is also said that a good mass may be made by incorporating the salt with extract of gentian.

The hypodermic injection may contain—

Morphine hydrochloride....	0.0025 gramme.
Cocaine hydrochloride.....	0.0100 gramme.
Sodium chloride.....	0.0200 gramme.
Sodium cacodylate.....	5.0000 grammes.
Phenol solution (5%).....	2 drops.
Distilled water....to make 100.0000 c.c. (mils.)	

A sodium cacodylate mixture contains—

Sodium cacodylate.....	2 grammes.
Distilled water.....	60 grammes.
Rum	20 grammes.
Simple syrup.....	20 grammes.
Oil of peppermint.....	2 drops.

Salts of cacodylic acid with bases of potassium, lithium, calcium, magnesium, silver, iron, and mercury are mentioned.

Brass Polish.—J. W. L., Pennsylvania.—We are not familiar with the preparation that you name, but of brass polishes there is no end. Numerous formulas for such polishes have appeared in former volumes of the CIRCULAR from year to year as reference to the annual indexes will show. We refer you especially to the issues for September, pages 470 and 472; August, page 413; and May, pages 235 and 238; all for last year; and August, 1909, page 410. Most or all of these are for polishes in paste form, which can be converted into liquid by the addition of oil,

alcohol, glycerin or water, as the case may be. In the CIRCULAR for October, 1908, page 470 are formulas for over a dozen different metal polishes, powders, pastes and liquids. Last month, too, page 207, we printed a formula for a brass polish.

Perhaps something like the following would be found suitable for your purpose:

Crude oleic acid.....	4 pounds.
Liquid petrolatum.....	1 pound.
Kieselguhr	1¼ pounds.
Oil of lemon.....	3 drams.

Household Salves.—S. S. B., Virginia.—We do not know the formula or the real or alleged therapeutic properties of the salves you mention, but perhaps some of the recipes printed or mentioned below may give you a “steer” in the direction of getting what you want:

Poslam.

According to analyses made in the laboratories of the American Medical Association, poslam consists essentially of—

Zinc oxide.....	12.01 parts.
Sulphur	6.67 parts.
Corn starch.....	22.00 parts.
Tar oil.....	15.18 parts.
Menthol	a small quantity.
Salicylic acid.....	a small quantity.
Fatty base (probably petrolatum)	
enough to make 100.00 parts.	

Healing Salve.

Resin	8 ounces.
Beeswax	8 ounces.
Zinc oxide.....	8 ounces.
Venice turpentine.....	4 ounces.
Lard	32 ounces.
Tannin	½ ounce.
Oil of sassafras.....	½ ounce.

A formula for mother's salve is given in the National Formulary under the title “Brown Ointment,” and in the same book are to be found formulas for compound tar ointment, “soothing ointment,” Wilkinson's or Hebra's ointment, and others adapted to more or less popular use.

Egg Shampoo.—V. B. R. S., Illinois.—The egg in so-called egg shampoos is usually present in the name only, although there are formulas for shampoos in which the use of real egg is directed. One such follows:

Ammonia water.....	4 drams.
Cologne water.....	5 drams.
Alcohol	8 ounces.
Water	8 ounces.
Whites of.....	2 eggs.

Beat the egg-whites well and add them to the water and ammonia water previously mixed; then add the other ingredients.

Other formulas for real egg and so-called egg shampoos appear in the issues of the CIRCULAR for September, 1910, page 468; and August, 1909, page 406.

Dentur Tales Doses.—W. E. B., Maine.—The initials, d. t. d., in a prescription, when used in connection with some number, as iv, for instance, mean, let (four) such doses be given. See Remington's Pharmacy, page 1093 of the fifth edition.

Elixir of Catnep and Fennel.—R. L. M., Pennsylvania.—We do not know anything about the composition of any preparation of catnep and fennel further than that on the label of a proprietary elixir of that name it is stated that the preparation contains 22 per cent. of alcohol and "catnep, fennel, spearmint and sodium bicarbonate in proportionate combination." Were we called upon to furnish an elixir of catnep and fennel we should ascertain from the physician desiring the preparation how much oil of fennel, oil of catnep, oil of spearmint and sodium bicarbonate he wished to have in each specified dose. We should then dissolve a sufficient quantity of each of the oils in about 200 c.c. (mils) of alcohol; dissolve the sodium bicarbonate in 500 c.c. (mils) of water; dissolve 400 grammes of sugar in the aqueous solution; add a few c.c. (mils) of compound spirit of orange to the alcoholic liquid; shake this mixture with a handful of filter paper pulp; add to it the syrup in divided portions, shaking after each addition; set aside the mixture for several days, shaking it four times a day; strain it through cheese-cloth; allow the colate to cool to about 60° F. (40° F. if in the winter); and filter it through paper, returning the filtrate until it came through clear.

Some folks may prefer to proceed along a different line, and as a guide to those we append this formula:

Triller's Carminative Elixir.

Tincture of orange peel.....	50 c.c. (mils).
Aromatic tincture.....	20 c.c. (mils).
Spirituos peppermint water....	20 c.c. (mils).
Fennel oil-sugar.....	5 grammes.
Caraway oil-sugar.....	5 grammes.

Then too there is the elixir of anise of the National Formulary.

Re-Silvering Mirrors.—P. A. K., New Jersey.—As we stated in the CIRCULAR for last month, page 205, so few pharmacists are interested in the matter except from an academic standpoint (as no one without proper equipment and a considerable amount of experience should expect to turn out a satisfactory job of this kind), that we think we should hardly be justified in taking the space to repeat every year or two the directions for re-silvering mirrors that we have printed from time to time. You may see such directions in the CIRCULAR for March, 1907, page 267; and in the issue for May, 1910, page 234 is some information in regard to repairing mirrors.

Solvent for Hard Rubber.—H. J. S., Pennsylvania, writes:

I wish a good volatile solvent for vulcanite. Have used chloroform, which is satisfactory as a solvent, but after being bottled for a month or more it seemed to deteriorate and generates a very offensive gas, forcing out the corks. Naphtha is satisfactory, only for the danger of handling the solution near a fire. Can you suggest a good volatile solvent that is not inflammable and will not deteriorate?

We take it that our correspondent has trouble with the deterioration of the solution of vulcanite and not with deterioration of the solvent. This deterioration presumably is brought about by the interaction of the sulphur in the hard rubber with the solvent and results in the formation of hydrogen sulphide. The hydrogen in the petroleum distillates being more closely combined these solvents are not so apt to interact with the rubber; but they have the drawback of in-

flammability and their use is consequently to be condemned. We know of no solvent that will fulfill all our querist's requirements, unless it be carbon tetrachloride. Owing to the absence of any data as to the behavior of solutions of vulcanite in the tetrachloride we are not able to pronounce such solutions stable. Theoretically this solvent seems to be especially adapted to the purpose under consideration, but hard rubber of itself will under certain conditions of temperature and moisture give off hydrogen sulphide. As an influence in this connection it is well to consider the composition of the hard rubber. This substance contains from 2 to 20 per cent. of sulphur, and as only about 2 per cent. is combined the percentage of free sulphur is a variable one and obviously not without effect upon the chemical action of the vulcanite.

Because of its anesthetic properties, the use of carbon tetrachloride is not without danger, and its users should govern themselves accordingly.

We should be glad to learn the results of any experiments along the lines herein mentioned that our correspondent or others of our readers may make.

Greaseless Cold Cream.—N. C. C., Minnesota.—Since you have not found a satisfactory formula for a non-drying greaseless cold cream among the many formulas for creams given in the CIRCULAR for January, 1910, pages 21 to 23, or among the supplementary ones that have appeared in subsequent issues, we are reproducing herewith a portion of an article on "The Manufacture of Greaseless Cold Creams," by H. B. Molyneaux, which originally appeared in the *Bulletin of Pharmacy*.

In my opinion there is only one method for making non-greasy cold cream. By this method the resulting cream is as near the ideal as any yet brought to my attention. The formula has only been contrived after many long and trying experiments, and after trying out almost every conceivable combination and proportion possible. It yields the best non-greasy cold cream, considered from every standpoint, that can be made. Physically it is a most beautiful preparation, having a satiny finish and luster that cannot be duplicated by any other method. It will stand up longer with less loss of water than any cream on the market. To the consumer it has none of the disagreeable medicinal features so common among these creams, such as irritating or greasing the skin.

In the beginning forgive me if I impress upon you the necessity of following the *modus operandi* to the letter. One of the first steps in this operation is the use of a granite-ware kettle of from 6 to 8 gallons in capacity for making the quantity contained in this formula. Weigh out accurately:

Stearic acid.....	3 pounds.
Powdered borax.....	1½ pounds.
Monohydrated sodium carbonate.....	1¾ av. ozs.
Glycerin	1½ pounds.
Distilled water.....	18 pounds.
Perfume, a sufficient quantity.	

Weigh the water, glycerin, borax, and sodium carbonate into a suitable vessel and effect solution by heating on a water- or steam-bath. When heated to 100° C., gradually add the stearic acid, which has been previously granulated, stirring constantly all the time during the operation.

Boiling distilled water should be added from time to time during the process to make up the loss by evaporation. The operator can gauge the hardness or softness of the cream according to the amount of water used in the process. Less water will stiffen the cream; more water will soften it. Under no circumstances should cold water be added to the cream during the process, and under no conditions should either hot or cold water be used after the cream has set.

It is very necessary that I call your attention to some of the important points to be observed in this process. First

of all see that the ingredients used conform to the descriptions in the beginning of this paper [they must be of U. S. P. quality]. Under no circumstances should the operator discontinue stirring the preparation before the product is cold. This is of vital importance. Do not discontinue the heat until saponification is complete.

In order to give an idea to the operator as to when the cream is finished, it will be well to describe the reaction and physical changes that take place during the operation. On adding the stearic acid the solution will begin to thicken and gradually become a gelatinous mass. After due time, through heating and stirring, it will begin to fluff up, and finally it will "come down" all at once to a semi-transparent liquid. At this point it should be removed from the fire and the perfume added. The preparation must be stirred until cold and should never be filled into jars or packages while hot, as it is apt to separate.

PERFUMES.

I.

Liquid aubepine.....	4 ounces.
Concrete oil of orris.....	1 ounce.
Borvordial, 10%.....	1 dram.
Oil of rose geranium, African.....	4 drams.
Benzyl acetate.....	1 ounce.
Deodorized alcohol.....	enough to make 1 pint.

II.

Muguet royal.....	8 ounces.
Oil of rose.....	2 drams.
Otto of jasmine.....	4 drams.
Oil of ylang-ylang.....	1 ounce.
Artificial musk, 100%.....	2 drams.
Benzole benzoate.....	enough to make 1 pint.

Precipitation in a Rose Water Solution.—X. Y. Z., New York, had trouble with a mixture composed of—

Cocaine hydrochloride.....	1 grain.
Boric acid.....	15 grains.
Sodium borate.....	5 grains.
Rose water.....	1 ounce.

He complains that a flocculent precipitate forms in the solution after it has stood a few days, notwithstanding the fact that he makes it of high-grade, official chemicals, and distilled rose water.

Ordinarily borax will precipitate cocaine from a solution, but will not do so in the presence of glycerin, or enough boric acid to render the liquid acid, as is the case with the mixture in question. It seems to us that the flocculency is due to the rose water, as the distilled aromatic waters display this phenomenon unless they are kept in containers loosely stoppered with a plug of sterile absorbent cotton. We suggest the use of plain sterilized distilled water, or rose water made by shaking oil of rose with hot sterilized distilled water in the proportion of about 4 drops to the pint.

Glazed Finish on Post Cards.—F. F. Z., New Jersey.—It is our opinion that the highly glossy coating on picture postal cards is gelatin applied in the way by which photographic papers are coated. The process is a simple one but requires special apparatus and training. We do not think that single cards could be coated satisfactorily; the large sheets of paper are coated by moving them across a tank containing a hot aqueous solution of gelatin in such a manner that the surface to be coated is in contact with the surface of the liquid. You might experiment with flowing a hot thin solution of gelatin over the surface of the card.

Glossy photographic prints receive a high polish by placing them face downward while saturated with water upon a sheet of ferrotype metal previously

brushed over with a weak solution of paraffin or spermaceti in benzin and rubbed dry with a pledget of cotton. The prints are pressed upon the ferrotype plate with a rubber roller or otherwise so as to expel all the air and water between the prints and the plate, after which the prints are allowed to dry spontaneously whereupon they will detach themselves from the plate. This procedure may be followed with other gelatin-coated cards. It should be borne in mind that the gelatin coating must be allowed to dry completely in a place protected from dust before the cards are saturated with water prior to being "squeegeed" on the ferrotype plate, and that benzin vapor is dangerously inflammable.

How to Fill Dr. Hyndman's Prescription.—John E. Groff, Rhode Island, accepting our oft-repeated invitation to those who can contribute anything of interest to this department do so, writes:

In the March number of the CIRCULAR, page 142, was a request for "Father John's" formula, and in the April number, page 205, a copy of Dr. Hyndman's prescription was given as a reply. This recipe affords a good example of the comparative worthlessness of a formula without the directions, for those who seek formulas are usually deficient, or at least not expert, in manipulation. Therefore with all deference to your correspondent, Mr. Dudman, who is from Boston, where the prescription was once common, I offer some data.

In the first place, on comparing my formula with the one you print, I find some differences, so I give Dr. Hyndman's own formula. I, too, am from Boston, and so know. These things get changed in time, and I can vouch for the genuineness of this, having filled it for Dr. Hyndman often.

Syrup of tolu.....	8 ounces.
Powdered extract of licorice.....	2½ drams.
Cod liver oil.....	10 ounces.
Spirit of peppermint.....	3 drams.
Compound tincture of lavender.....	5 drams.
Confection of almond.....	1 dram.

Triturate the extract of licorice and the confection of almond with one-half the syrup of tolu until a smooth paste is formed; add the oil gradually, stirring after each addition, until emulsification is complete; then add the balance of the syrup of tolu, to which has first been added, and stirred in, the spirit of peppermint and compound tincture of lavender.

By this plan a perfect emulsion is effected.

Confection of Almond.

To make the confection of almond, which is the emulsifying agent, the following plan is good, for those who use enough to make it worth while:

Blanch the almonds by placing them in boiling water for three minutes, slip the skin off between the thumb and forefinger, and dry them between folds of cloth; when dry grate them on a nutmeg grater and let them stand in a dry place until brittle. Triturate with the acacia and sugar and keep in a bottle tied over with gauze. [These are practically the directions found in the British Pharmacopoeia, the proportions of the ingredients being, almonds, 8; sugar, 4; acacia, 1.—Editor THE DRUGGISTS CIRCULAR.] I have a sample in my cabinet which is sixteen years old, unspolled.

This contribution is indeed interesting and we feel sure our readers will join us in extending thanks to Brother Groff for making it.

What Is "Spiritus Gallicorum"?—H. W. B., District of Columbia.—Knowing nothing of the use to which the preparation is to be put and nothing of the connection in which the name occurred, and not being able to find the name in any lexicon or text-book, we are reduced to the necessity of guessing outright. Our guess is that "spiritus gallicorum" is a synonym in distorted and bad Latin for "spiritus vini gallici," gallicorum being the plural of gallici.

Crude Oil Hair Tonic.—J. C. H., Pennsylvania, wants a "formula for a crude oil tonic cut down with bay rum and alcohol." Such a formula to the best of our knowledge does not exist, primarily, because crude oil (crude petroleum) is not of itself soluble in or miscible with alcohol or hydro-alcoholic liquids. The oil "tonics" of our acquaintance have been mixtures of castor oil and alcohol. But castor oil, it would seem, is not a satisfactory substitute for crude oil in the realms of capilliculture, the vogue enjoyed by the product of the oil-well being based upon the belief that its action as a rubefacient and as a stimulant of the sebaceous secretion is peculiarly efficacious, this belief, in turn, having some connection with the fact that native petroleum contains sulphur.

Crude oil is generally applied as a hair tonic in its natural form, although the characteristic odor of the oil is sometimes more or less effectually masked with aromatics. A bona-fide crude oil hair "tonic" would be a "shake" mixture and a far from "elegant" one. To offset the untoward psychological effect of the appearance of the mixture it should be marketed in opal-glass containers or in bottles completely covered with a paper wrapper.

As a formula to start with we offer this one:

Crude petroleum.....	150 c.c. (mils).
Alcohol	450 c.c. (mils).
Oil of bay leaves.....	5 c.c. (mils).
Oil of pimento.....	5 c.c. (mils).
Oil of lavender.....	5 c.c. (mils).
Oil of cloves.....	2 c.c. (mils).
Water.....	enough to make 1,000 c.c. (mils).

Shake the crude oil with the aromatic oils and 300 c.c. (mils) of alcohol. Add the rest of the alcohol mixed with 300 c.c. (mils) of water; shake well for ten minutes and add enough water to make 1,000 c.c. (mils).

For making hair oils, crude oil from the Texas fields is preferable because of its greater sulphur content.

Eversweet.—H. J. S., Pennsylvania.—We do not know the composition of this article.

Generally speaking, preparations for preventing the disagreeable odor of perspiration act by doing one of three things, or a combination of two or more of them—they (1) clog the pores of the skin, and so retard the flow of perspiration, or (2) act as an antiseptic, and so prevent the souring of the perspiration, or (3) saponify the grease of the perspiration—the souring of which causes the bad odor. To the first class belong many of the greases and salves; to the second, boric acid; and to the third, sodium bicarbonate. Of course it injures one to stop one's perspiration, and so salves and pastes for this purpose should be used sparingly if at all.

A formula for a preparation which, while a grease, also acts as an antiseptic, is as follows:

Thymol	2 grammes.
Zinc oleate.....	200 grammes.
Boric acid.....	150 grammes.
Petrolatum cold cream.....	650 grammes.

Other formulas for preparations to be used in overcoming the disagreeable odor of perspiration are to be found in the issues of the CIRCULAR for February, August, and December, 1909, pages 79, 400, and 638, respectively.

Kümmel.—F. T. J., New Jersey, wants to make a kümmel more nearly like the imported than he can produce by following the formula for elixir of anise in the National Formulary. He might try the following, by Dietrich, for the Russian *Alasch*:

Oil of anise.....	2 drops.
Oil of bitter almond.....	2 drops.
Oil of parsley.....	5 drops.
Oil of rose.....	3 drops.
Oil of caraway.....	2.0 grammes.
Tincture of vanilla.....	2.0 grammes.
Sweet spirit of niter.....	20.0 grammes.
Alcohol (90%).....	3650.0 grammes.
Sugar	3000.0 grammes.
Water	3500.0 grammes.

Dissolve the oils in the alcohol, and add the tincture, spirit of niter, and the water in which the sugar has been dissolved.

In discussing the food law, a humorous writer in a daily paper says:

You drink your French brandy and then wonder why you have the sensation of a lighted lamp in your stomach and a procession of lightning bugs climbing up and down your throat. But you wouldn't if you could see them when they make it. Kümmel is manufactured out of an inferior grade of canary bird seed, thus explaining why when a man drinks enough of it he flies up on the table and sings himself to sleep with his head under his wing.

Creosote Pills and Dangerous Prescriptions.—

J. L. Lascoff, New York, takes issue with his fellow-townsmen, José Schwarz, on the question of massing creosote for pills. Mr. Lascoff had something to say on the subject at a meeting of the Brooklyn Pharmaceutical Association reported in the CIRCULAR for February, pages 111 and 112. In the CIRCULAR for March, page 141, Mr. Schwarz was quoted as follows:

Just mix equal parts of distilled water and creosote and add powdered balsam of tolu, and see what a fine pill mass you can obtain without the addition of beeswax or any other substance.

Mr. Lascoff now writes that the method he gave for filling the prescription which called for fifty pills, each to contain 0.12 c.c. (mil) of creosote and 0.2 gramme of tolu is to emulsify the creosote with a little acacia, adding the finely powdered tolu with enough powdered glycyrrhiza to make a mass. This, he contends, is the only way in which a small pill can be produced. And he opines that a pill made according to Mr. Schwarz's directions would weigh at least 10 grains, because of the large amount of absorbent required. In Mr. Lascoff's opinion the excessive size of the average drug-store pill is the reason which actuates physicians to prescribe so generally the ready-made variety.

Blindness from Santonin.

In the same communication Mr. Lascoff, referring to an article on "Blindness from Santonin," which appeared in the CIRCULAR for March, page 132, points out the similarity of the results following the administration of oleoresin of male fern together with castor oil, a matter brought up by him in a paper read before the Kings County Pharmaceutical Society, and printed in the CIRCULAR for January, page 19. In this connection Brother Lascoff writes:

I should like to know what steps a pharmacist should take when he receives a prescription of this nature. Several druggists have asked me whether they should fill such prescriptions; and I should like to get your views for the

benefit of our fellow-pharmacists. The dangerous effects of these are known, and in my opinion we should not dispense them unless the physician insists upon our doing so; and in this event it would be advisable to have an extra signature of the writer appear on all such prescriptions, the same as on those in which large doses are prescribed.

Because of the fact that the danger attending the administration of santonin or oleoresin of male fern is increased when either is given in connection with an oil, it is our opinion that the pharmacist receiving a prescription calling for such a combination should call the prescriber's attention to the risk to the patient and endeavor to have the doctor change the prescription. Should the prescriber be unwilling to do this, the pharmacist should insist upon the intent of the prescriber being plainly designated on the prescription. In case this safeguard could not be secured we should refuse to compound the medicine. In no circumstances should a prescription for santonin or oleoresin of male fern be renewed without a written direction from the prescriber; and it would be well to keep it before both physicians and pharmacists, that the use of either drug carries a risk to the eye-sight, regardless of its use with oil; the latter, as we have said, simply increases the risk.

A Delicate Test for Acetanilide.—G. N. Watson, Kansas, supplies the following note:

"Acetanilide when heated together with boric acid over naked flame until the boric acid melts, produces a yellow residue having a peculiar fragrant odor suggestive of sweet clover or arbutus. The yellow color is also produced by phenacetine. Antipyrine produces a pink color and a naphthalene-like odor. Phenacetine produces an odor, but one characteristic of itself, more faint than that produced by acetanilide or antipyrine. With mixtures of the three antipyretics, the fragrant odor produced by the action of the acetanilide predominates. One minim of a 1 per cent, solution of acetanilide is sufficient to produce the characteristic odor, which is intensified by adding a few drops of water to the residue. This test suggests the use of acetanilide as a test for boric acid, the delicacy of which is worthy of investigation."

We thank Mr. Watson for his interesting contribution, which we hope will be found of value by many of our readers, and trust that he will let us hear from him again. His example might be followed by many readers who have interesting matter stored in their heads which should be let out for the benefit of pharmacy generally.

Bed Bug Killer.—H. S. C., Connecticut.—We do not know of anything that will do and not do all that you require. We have been unable to find on this market a bottle of the proprietary preparation you mention, but hope to secure one elsewhere in time. If we succeed we may have something more to say in reply to your query. Insect powder (pyrethrum) is about as effective for killing bed bugs as any insecticide in powder form that we can think of just at present.

Preventing the Fetid Odor of Cancer.—E. S. M., Pennsylvania.—We believe that physicians use for this purpose salicylic acid, applied in the form of an undiluted dry powder. But this is a matter in which pharmacists should not meddle.

Board Questions Published.—During the past score of years or so we from time to time have endeavored to secure for publication sets of questions used by each of the various boards of pharmacy throughout the country. Some of the boards have not responded to our requests. We have printed questions as indicated below:

- Alabama, June, 1910, page 286.
- Arizona, none.
- Arkansas, May, 1910, page 240; September, 1908, page 466.
- California, May, 1905, page 158; September, 1893, page 215; February, 1892. (This board does not give out its questions for publication now.)
- Colorado, April, 1909, page 195; June, 1906, page 214; October, 1887, page 234.
- Connecticut, none.
- Delaware, November, 1909, page 591; November, 1907, page 739; September, 1906, page 338; December, 1904, page 280.
- District of Columbia, April, 1905, page 122; February, 1901, page 43. (This board does not give out its questions for publication now.)
- Florida, October, 1909, page 527; March, 1908, page 127; August, 1906, page 299; May, 1911, page 263.
- Georgia, August, 1909, page 411; July, 1907, page 481; February, 1906, page 60; June, 1904, page 125; December, 1901, page 251.
- Idaho, February, 1907, page 226.
- Illinois, August, 1887, page 188.
- Indiana, January, 1910, page 27; July, 1908, page 326.
- Iowa, none.
- Kansas, none.
- Kentucky, none.
- Louisiana, April, 1909, page 194; January, 1906, page 23; February, 1905, page 57; April, 1893, page 92.
- Maine, April, 1911, page 207.
- Maryland, none.
- Massachusetts, April, 1910, page 181; May, 1906, page 177; January, 1890, page 21.
- Michigan, none.
- Minnesota, January, 1906, page 24; December, 1887, page 286.
- Mississippi, March, 1910, page 127; September, 1909, page 461; April, 1907, page 318; November, 1905, page 399; November, 1904, page 255; December, 1900, page 259; January, 1895, page 20; August, 1894, page 188.
- Missouri, December, 1909, page 643; November, 1908, page 576; June, 1907, page 424; July 1906, page 254.
- Montana, September, 1908, page 435; March, 1905, page 90.
- Nebraska, January, 1911, page 36; December, 1910, page 638; December, 1908, page 621; May, 1907, page 370; November, 1906, page 408; August, 1904, page 185; September, 1897, page 264.
- Nevada, none.
- New Hampshire, none.
- New Jersey, June, 1909, page 298; August, 1907, page 547; August, 1905, page 283; May, 1904, page 108; September, 1897, page 264.
- New Mexico, July, 1909, page 351.
- New York, March, 1911, page 143; October, 1910, page 519; December, 1909, page 642; January, 1909, page 23; January, 1908, page 30; March, 1907, page 274; April, 1906, page 138; January, 1905, page 21; July, 1904, page 157; (City) April, 1898, page 95; March, 1898, page 95; December, 1890, page 285.
- North Carolina, December, 1909, page 641; May, 1908, page 227; March, 1905, page 90; December, 1894, page 286; May, 1892, page 117; October, 1887, page 234.
- North Dakota, March, 1909, page 135; July, 1906, page 254.
- Ohio, March, 1909, page 136; March, 1906, page 99.
- Oklahoma, January, 1905, page 22; (Indian Territory) December, 1905, page 438.
- Oregon, February, 1910, page 72; September, 1907, page 605; September, 1905, page 321; May, 1898, page 120; November, 1897, page 340.
- Pennsylvania, May, 1909, page 243; February, 1908, page 77; September, 1904, page 208; March, 1893, page 69.
- Rhode Island, none.
- South Carolina, none.
- South Dakota, August, 1910, page 424; July, 1905, page 737.
- Tennessee, May, 1911, page 262.

Texas, November, 1910, page 579; April, 1908, page 177; February, 1895, page 46.

Utah, none.

Vermont. This board does not give out its questions for publication, but will send them to other boards, or to colleges, on request.

Virginia, December, 1905, page 439; December, 1900, page 259; June, 1892, page 141; December, 1891, page 286. (This board has discontinued giving out its questions for publication.)

Washington, June, 1905, page 195. (This board has discontinued giving out its questions for publication.)

West Virginia, none.

Wisconsin, February, 1911, page 87; February, 1909, page 81; December, 1907, page 780; October, 1904, page 234; October, 1897, page 314; October, 1895, page 250.

Wyoming, none.

Terpin Hydrate with Heroine.—D. Archie Bullock, South Carolina, who has favored us with notes on other subjects, now writes:

In your March issue (page 139) there is a request from T. A. C., Massachusetts, for some information concerning creo-terpin. I have a formula that I have copied which has the name of Henry Watters signed to it. I give it to you herewith:

Elixir of Terpin Hydrate with Creosote.

Terpin hydrate.....	320 grains.
Heroine hydrochloride.....	14 grains.
Glycerin	8 ounces.
Alcohol (90%).....	16 ounces.
Beechwood creosote.....	320 minims.
Simple elixir.....to	40 ounces.
Elixir of glycerophosphates of calcium and sodium.....	40 ounces.

I color this green by adding a colored leaf to the glycerin and alcohol, and this makes a good green coloring without odor or taste.

We have found this an excellent preparation.

We again thank Mr. Bullock for his kindness and express the hope that he will continue to remember us when he has anything which he thinks might be of interest to our readers to make public.

Henry Watters is a distinguished pharmacist of Ottawa, Canada, a portrait and sketch of whom appear in the CIRCULAR for November, 1909, page 147.

Photographs on Cloth.—"Subscriber," Kansas.—To render silk or other textile fabric impervious to a sensitizing liquid, the surface of the cloth is brushed over with a solution of gelatin in water. Sometimes mucilage of acacia is used as a size for this purpose, but its proneness to deterioration is not conducive to happy results.

Reciprocity between Boards of Pharmacy.—"A Reader," Nebraska.—We answer a query similar to yours every little while. Our most recent answer to such a query appears in the CIRCULAR for March, page 138, and consists of a reference to a column-and-a-half note on the subject in the January number, page 31.

Deodorizing Carbon Disulphide.—F. R. S., Iowa.—In further answer to your query we may call attention to the fact that it is said that the odor of carbon disulphide may be removed by shaking the liquid with a 1 per cent. solution of corrosive mercuric chloride and thoroughly washing with water.

Verbenin.—W. E. B., Maine, asks what this is and where it may be obtained.

In reply to an inquiry from us, the William S. Mer-

rell Chemical Company, of Cincinnati, writes: "We formerly made a so-called resinoid under the name of verbenin, but as its sale was very limited, we discontinued its manufacture some years since and regret that we have none of the article on hand at this time."

Appeals to Readers.—Information is sought concerning the articles listed below. We ask for such help as our readers can give:

Sanford's Liver Invigorator.—F. E. S., Michigan.

Casler's Oriental Paste.—P. P., Illinois.

Fidol.—R. C., New York. Where may it be obtained?

Dirty and Dangerous.

Under this heading the editor of the *California Medical Journal* writes: "One of our members has written to the *Journal* calling attention to a very dirty practice in most pastry stores—and possibly in other shops, though the special case in point was a pastry shop. In many of these, the paper for wrapping packages, cakes, bread, etc., is in sheets and when the saleswoman reaches for a sheet of paper she generally holds the cake or loaf of bread in the left hand and reaches for the sheet of paper with her right hand, dexterously wetting her thumb with saliva to facilitate the quick detaching of the top sheet on the pile. Not infrequently that portion of the sheet of paper which she has moistened with her spittle is then turned in and wrapped against the food that is later to be eaten, thus transferring some of her sputum from herself to other persons. It is in no circumstances a pleasant little proceeding and under some conditions one can imagine it to be very dangerous. Our correspondent, for instance, on one occasion saw a woman whom he knew to be syphilitic and to have mucus patches in her mouth, do precisely this thing; and the moistened portion of the sheet of wrapping paper came in contact with the cake which she was wrapping. Doubtless this is just one of the little things that have not come to the attention of the proprietors of such stores. The use of paper in rolls would go far to stop the practice, for there is not the necessity to wet the finger in order to separate one sheet from another."

Optometry at Columbia University.

The Medical Society of the County of New York recently passed a resolution deploring and condemning the action of Columbia University in establishing a course in optometry and turning loose "dangerous inefficient upon the public, especially as it has a medical department in connection with which it can thoroughly educate them to treat the eyes and correct their refractive errors." The resolution is prefaced by a statement of the well-known reasons why oculists should have a good general medical education.

Bandoline.

The following formula is said to represent the mustache fixative used by one of the most famous Parisian hair dressers:

Extract of malt.....	25 grammes.
Alcohol	45 c.c. (mils).
Rose water.....	400 c.c. (mils).

Tennessee Board Questions.

Herewith are reprinted the questions used by the Tennessee Board of Pharmacy at its examinations held January 17th to 20th.

In reprinting board questions we endeavor to follow closely the nomenclature, spelling, punctuation and capitalization of the originals, our object being to give to our readers, just as nearly as practicable, the questions as they were presented to the candidates:

Pharmacy.

1. To what class of substances do each of the following belong: (a) Assafoetida. (b) Acacia. (c) Sparteine. (d) Copaiba. (e) Storax.

2. (a) Give the Latin name of Tartrated Antimony. (b) Give its medicinal properties and doses. (c) Into what preparations does it enter?

3. (a) What per cent. of Phenol is soluble in water? (b) What will increase the solubility of Phenol in water? (c) What per cent. is soluble in Alcohol?

4. (a) Why is Monohydrated Sodium Carbonate used in the process of manufacture? (b) Describe it and give its medicinal properties and uses. (c) What is the specific gravity of the official preparation? (d) At what temperature is it directed to be taken? (e) What was its specific gravity according to U. S. P. 1890? (f) And at what temperature? (g) Why was this important change made in the 8th revision?

5. (a) What per cent. of Metal does Massa Hydrargri contain? (b) Why is long continued trituration necessary?

6. (a) How would you detect the presence of Salicylic Acid in suspected fruit syrups and juices? (b) From what is Iodine obtained? (c) Name the test for free Iodine in solution. (d) What Acid is formed by Iodine and Hydrogen?

7. (a) What is Formaldehyde the product of? (b) Describe it. (c) What are its medicinal properties and uses? (d) What is it often used for unlawfully? (e) Mention the best antidote for its poisonous effects.

8. (a) Name the Collodions of the U. S. P. (b) Which one contains Canada Turpentine and Castor Oil? (c) What four Collodions are mentioned in the National Formulary?

9. Name antidote for the following and their Salts: (a) Mercury. (b) Antimony. (c) Chromium. (d) Copper. (e) Iodine. (f) Zinc.

10. (a) Name the poison for which Lime or Lime Water is an antidote. (b) Common Salt is an antidote for a certain poison; name it. (c) From what is Methyl Alcohol obtained? (d) How would you detect it in Alcohol solution?

Practical Pharmacy.

1. Translate into English, and convert quantities into Apothecaries weights.

	Gm.	cc.
R Chrysarohinum	2	.6
Resorcinol	0	.78
Traumaticine	29	57

Misce fiat Mistura, et Signa, Agitato vase, Admoveatur bis die.

2. Criticise and state how you would dispense.

R Phenol	3ii
Liq. Calcis.....	3xiv

M. ft. Sol:

Signa, Apply on gauze to affected parts.

3. How would you prepare the following Syrup for dispensing?

R Ol. Sassafras.....	mvii
Tr. Tolut.....	3i
Magnes Carb.....	3ii
Aqua Destil.....	oi
Sacchara Alba.....	3xxii
Morphia Hydrochlor.....	Grs.viii

Mft. Syr: Sec: Artem.

4. Give the correct method of preparing the following prescription?

R Potassil. Chlor.....	3i
Acid Hydrochlor.....	3i
Aqua Destil.....	3iiss
Glycerinum	3iv

Misce fiat Sol.

5. How can granulated Effervescent Salts be quickly and easily made at the prescription counter and how is granulation produced?

6. (a) Why is Ammonia Water used in Aromatic Spirits Ammonia? (b) Why is Aromatic Sulphuric Acid used in Infusion Cinchona? (c) Why is Boiling Water directed to be used in Wine of Antimony? (d) Why is Acetic Acid used in Fld. Ext. Sanguinaria? (e) Why is Sugar used in Iron preparations?

7. How will you test Water to ascertain its fitness for drinking and Pharmaceutical purposes?

8. (a) Pharmaceutical Arithmetic. How many fluid ounces in 500 Grammes of Chloroform Spec. Gravity, 1.49? (b) If 500 Grammes Chloroform cost \$1.05, what will one fluid Ounce cost?

9. Reduce five gallons of Alcohol to 40 per cent. Alcohol. How much water will it take, and how many gallons will result?

10. (a) How would you measure the freezing temperature below the freezing point of Mercury? (b) Convert 20 degrees Centigrade to Fahrenheit? (c) Convert 50 degrees Fahrenheit to Centigrade? (d) Give boiling point of Centigrade? (e) Give freezing point of Centigrade? Give your rule and show figures in converting.

Chemistry.

1. (a) Of what does the science of Chemistry teach? (b) Into what two general classes is it divided? (c) What is the difference between a chemical compound and a mixture? (d) Give an example of each.

2. (a) What is a molecule? (b) An atom? (c) What is a chemical symbol? (d) What is a Base? (e) A Salt?

3. (a) What are Elements? (b) Into what two classes are they divided? (c) Which are liquid at ordinary temperature? (d) Name five that are gases.

4. (a) What is analysis? (b) Synthesis? (c) Specific Gravity? (d) What is the difference between Qualitative and Quantitative Analysis?

5. (a) How is Iron found in nature? (b) How is Ferri Sulphus Exsiccatus prepared? (c) How does it differ in appearance for Ferrous Sulphate? (d) What is the color of the precipitate formed when an Alkali is added to a solution of a Ferrous Salt? (e) When added to a solution of a Ferric Salt?

6. Give official Latin and English names of the following: K C L O₃—NH₄Br—Ag NO₃—As₂ O₃—Na Cl. Give brief physical description of each.

7. White chemical formulae of the following and give brief physical description of each: Potassium Bi-Carb. Oxide Zinc, Yellow Ox. Mercury, Mercuric Chloride, Phenol.

8. (a) What is the official Latin name of Goulard's Extract? (b) What ingredients enter into its composition? (c) What official preparations are made from it?

9. What is the specific gravity at ordinary temperature of the following: (a) Glycerine, (b) Alcohol, (c) Ether, (d) Chloroform, (e) Sulphuric Acid, (f) Nitric Acid, (g) Mercury, (h) Gold, (i) Copper, (j) Simple Syrup.

10. Write official Latin and English name of the following: (a) Copperas, (b) Blue Stone, (c) Sugar Lead, (d) Glauber Salts, (e) Spirits of Sea Salt, (f) Quicksilver, (g) Sal Ammoniac, (h) White Precipitate, (i) Red Precipitate, (j) Tartar Emetic.

Materia Medica.

1. Of what does Materia Medica treat?

2. (a) What are Alkaloids? (b) How many are official? Name principal alkaloid contained in each of the following: (c) Opium? (d) Cinchona? (e) Nux Vomica? (f) Jaborandi? (g) Calabar Bean.

3. Give safe maximum dose of each of the following and state from what source obtained: (a) Sparteine? (b) Codeine? (c) Caffeine? (d) Hyoscyne? (e) Atropine?

4. Give official name, habitat, part used and one official preparation of each of the following: (a) Rhubarb? (b) Wild Cherry? (c) Witchhazel? (d) Golden Seal? (e) Black Cohosh?

5. Give safe maximum dose of each of the following: (a) Asenic Trioxide? (b) Acid Hydrocyanic Dilute? (c) Bichloride Mercury? (d) Tr. Aconite? (e) Tr. Nux Vomica? (f) Tr. Gelsemium? (g) Ext. Belladonna? (h) Chloral Hydrate?

6. Give source and a brief physical description of (a) Menthol? (b) Salol? (c) Salicin? (d) Acetanilid? (e) Santonine?

7. (a) Give official name of Iodine? (b) State from what obtained and how? (c) Name the official preparation

of Iodine? (d) Give antidote for Iodine poisoning? (e) What percentage of Iodine does Iodoform contain?

8. (a) From what is Glycerine obtained? (b) What percentage of Glycerol does it contain? (c) Name five official Glycerites? (d) Why should you not dispense Chromic Acid with Glycerine?

9. (a) From what source is Camphor obtained? (b) How is it prepared for commerce? (c) What is its best solvent? (d) How can it be powdered? (e) Give medicinal properties and dose?

10. Give the meaning of the following terms and one example of each: (a) Antipyretic? (b) Diuretic? (c) Caustic? (d) Emetic? (e) Demulcent? (f) Anodyne? (g) Carminative? (h) Cathartic? (i) Aperient? (j) Hypnotic?

Florida Board Questions.

Herewith are reprinted the questions used by the Florida Board of Pharmacy at an examination held on January 23d, 1911. Other sets of questions asked by this board appear in the issues of the CIRCULAR for October, 1909, page 527; March, 1908, page 127; and August, 1906, page 299.

Pharmacy.

Processes.

1. (a) What is the Pharmaceutical term used for Cutting, Grating, Bruising, Grinding, Etc.? (b) Name three or more apparatuses used for this purpose. (c) What is the object of treating drugs in this manner.

2. (a) What is the difference between a simple and a chemical solution? (b) Name four or more solvents used in Pharmacy in order of their importance, telling the classes of substances each is used for. (c) What process facilitates the solution of a solid substance?

Preparations.

3. (a) What are Tinctures, naming the methods for preparing them? (b) Outline the preparation of one in each class. (c) What are Spirits, naming the methods official for their preparation, outlining the preparation of one by each method?

4. (a) How do Laudanum, Deodorized Tincture of Opium and Paregoric differ? (b) How do Water of Ammonia, Stronger Water of Ammonia, Spirit of Ammonia and Aromatic Spirit of Ammonia differ? (c) How would you make Water of Ammonia from Stronger Water of Ammonia?

Pharmaceutical Arithmetic.

5. (a) A certain formula calls for 70 Gm. Acetanilid, 10 Gm. Caffeine, 20 Gm. Sodium Bicarbonate: how much of each would be required to make 20 ozs.? (b) What is the Pharmacopoeial name of the finished product?

(Pure Food and Drug Law.)

6. (a) The proportions or quantities, contained in each ounce, of what drugs are required to be mentioned on the label? (b) How do you find the percentage of Alcohol in a mixture when the percentages of Alcohol of the various items entering therein are known? (c) Write a correct legal label for the following mixture: Laudanum, 1 oz.; Tr. Arnica, 2 ozs.; Water, 5 ozs. NOTE—Laudanum, (alc., 46%; opium, 10%); tr. arnica (alc., 40%).

Identifications

7. (a) Identify Specimen No. 1. (b) Name ingredients. (c) How is it made?

8. (a) Identify Specimen No. 2. (b) Name ingredients. (c) To what does it owe its characteristic odor?

9. (a) Identify Specimen No. 3. (b) Name ingredients. (c) How is it made?

10. ORAL:—National Formulary Preparations.

Chemistry.

1. What is matter? (b) It is constantly subject to changes, and these may be of two distinctive characters: What are they?

2. (a) What is a synthetic reaction? (b) An analytic reaction? (c) An atom? (d) Molecule? (e) Element?

3. (a) What general rules of solubility may be applied to the Nitrates, Chlorides, Sulphates, Phosphates and Carbonates? (b) Give some exceptions.

4. (a) What is a Salt? (b) Normal Salt? (c) Acid Salt? (d) Double Salt? (e) Basic Salt?

5. (a) Give a definition of the following words as ap-

plied to Chemistry: Proto, Deutro or Di., Sub, Super or Hyper., Per.

6. Criticise the following prescription:

R Protargol	2.0
Cocaine Hydrochloride	.5
Distilled Water	60.

7. (a) A chemical reaction takes place in the making of an official ointment: What is the reaction known as? (b) Give U. S. P. name of this ointment.

8. Give synonyms of twenty Pharmacopoeial chemicals: (Example, Plumbi Acetas: Sugar of Lead.)

9. Give Latin official names of twenty Pharmacopoeial Chemicals. (Example: Hydrargyri Oxidum Flavum.)

10. (a) What is an Alcohol? An Aldehyde? (b) Give an example of each.

Materia Medica.

1. Define (a) Materia Medica; (b) Therapeutics; (c) Pharmacognosy; (d) Toxicology; (e) Posology.

2. Name two manners by which a drug may act as an antidote for another.

3. Define the following terms and give an example of each. (a) Anodyne; (b) Hypnotic; (c) Rubefacient; (d) Hydragogue; (e) Cholagogue.

4. (a) What is meant by the term Alterative? (b) Name one of vegetable origin; (c) Of animal origin; (e) Of mineral origin.

5. What is meant by the term (a) Origin; (b) Habitat; (c) Natural Order.

6. Name five active principles found in vegetable drugs.

7. Would a menstruum composed of Alcohol 1 part, Water 4 parts, extract the active principles of the following drugs? (a) Senna Leaves; (b) Buchu; (c) Hydrastis; (d) Cinchona; (e) Jalap.

8. Nux Vomica: (a) Give Habitat; (b) Origin; (c) Part used in medicine; (d) Active Principle; (e) Official requirement.

9. Give Official Name and definition of (a) Hydrastis; (b) Cinchona; (c) Aloes; (d) Mandrake; (e) Cascara Sagrada.

10. Give Latin name; (b) Use; (c) Dose; of drugs in boxes 1, 2, 3, 4, 5.

Prescriptions, Doses and Toxicology.

1. R Sol. Cocaine Mur. 7% ʒi.

Sig. Local use.

How many grains of Cocaine Mur. would be used in filling the above prescription?

2. R Sol. Hydrarg. Bichlor. ʒiv.

Ft. Liq. of such strength so that when ʒi of the solution is added to 1 quart of water it will make a solution the strength of which will be 1-3000.

3. Criticise the following R:

R Potass. Iodide	ʒiii
Bismuth Sub-Nit.	ʒii
Ess. Pepsin qs.	ʒiii

M Sig. ʒi in aq. q. 4 h.

4. Criticise the following R:

R Bismuth Sub-nit	gr. xvi.
Mercury and Chalk	gr. xvi
Tr. Opii Camph.	ʒii
Aq. Ment. Pip. qs.	ʒii

M et ft. Mist.

Sig. ʒi q. 2 or 3 h. for bowels.

5. Criticise the following R:

R Arsenic Trioxide	gr. i
Tr. Iron Chlor.	ʒiv
Strychnia Sulph.	gr. i
Acid Muriatric Dil.	ʒiii
Syr. Limonis qs.	ʒvi.

M.

Sig. ʒi in aq. ttd p.c.

(Questions 6, 7, 8, 9 and 10 will be oral.)

A writer in the *New York Times* referring to the vitality of old jokes, quotes the one about the little girl who asked the druggist for pills, and when the druggist asked, "Antibilious?" replied, "No, uncle is." He comments: "I have a vivid recollection of having read that in a patent medicine almanac when I was a very small boy." Unfortunately he fails to state how old he is, but he may be a very old man and still be a truthful one.

Correspondence.

Short, timely articles upon subjects of interest to pharmacists are solicited for this department. In order to be in time for publication in the issue of a given month, they should be in the editor's hands on the fifteenth day of the month previous. Anonymous communications will not be published; but if the author expresses a wish to have his name withheld, this wish will be scrupulously regarded and his letter considered confidential.

Advanced Education in Pharmacy.

Newark, N. J., April 6th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

The medical profession and the druggist are continually exhorting the legislatures of the various States to raise the educational standard of candidates for the State examination in pharmacy. Some recommend that the candidate be a graduate in pharmacy, and in States where that degree is already required the professions are crying for advanced academic qualifications.

The doctor's purpose in this is not purely an unselfish one. It will unburden him, in part, of the grave responsibilities which he should justly bear, and he may with better grace apportion to the share of the pharmacist the culpability for an inexactness in prescribing, or the failure of results. For a legislature demanding more thorough qualifications will also place greater responsibility on the already over responsible druggist.

As for the druggist, outside of a few high-minded men who honestly desire a more thorough equipment for the sake of pharmaceutical research, this agitation for advanced qualification in the student is mercenary. It is bred of the desire to retard competition. My professional brethren may deny such uncharitable views, but ask each one what fault he finds, if any, with the drug trade in his particular precinct, and the probable reply will be, the keenness of competition, and the metamorphosis of the profession of pharmacy into the drug business. Therefore, let us demand higher standards of the students, and thereby stifle increased competition. My views may shock the druggists, but I hold that this is the logical, though never admitted reason, for the druggists' stand in the matter of increased qualifications of drug students.

But let us view dispassionately and without prejudice the true situation, admitting for the moment that all who ask for such advancement do so with the noblest intent, holding that specialization and the maturity of a rounded education will make the pharmacist far more learned in the science of drugs and chemicals, and more capable and exact in their composition and dispensing. Of what avail is all this learning, capability and accuracy? The druggist no longer compounds; his is the mechanical act of filling bottles, or selling proprietary tablets and pills, even as is the filling of milk bottles or the sale of so many beans over the grocer's counter.

The druggist may think I go to extremes in so commercializing what he would fain call the profession of pharmacy. Here are facts. In nine years of actual and varied service in drug stores, I found that 80 per cent. of the tinctures, fluidextracts, and remaining pharmacopœial preparations were procured from pharmaceutical houses; the druggist did not percolate, macerate or extract in any form the medical prin-

ciples of a drug, nor manufacture the remaining preparations I refer to, but was satisfied to say, "Oh, they are all reliable houses, so I guess they are all right." So much for my personal experience with drug stores, and I dare say from deduction that at least 50 per cent. of our druggists do not manufacture their own preparations. Now, let me ask, how much theoretical knowledge, or rounded out academic knowledge, is essential to compounding prescriptions in a store of this character? Of what avail my exhaustive study of the Pharmacopœia, materia medica and toxicology at a college of pharmacy, when in actual practice a clerk of two-years' standing, with a slight knowledge of the names of drugs and a meager experience in the reading of prescriptions, could have just as well compounded the great majority of such prescriptions as I received during my practice? And as for chemistry, there is a remote possibility of using this science practically in the drug store as it is now constituted. And still my friends in the profession are asking for an academic education to mature the mind of the student and educate him to the responsibilities of a druggist. In their eyes, he needs a specialized training to dispense proprietaries and different medicaments manufactured by the pharmaceutical houses. Why deceive ourselves by the vain empty title Ph. G.? The so-called drug profession has developed into a simple pecuniary business, and the druggists' call for advanced requirements is a conceited tribute to what they know is not a profession but a business.

Is it not true that the department store carrying a side line of drugs and prescriptions, which, by the way, is universally called a drug store, needs no further specialization in the education of its clerks than a simple practical experience? Then why play hypocrites and call for a severe special training for the student wishing to enter the field of drugs? I feel that this is a true exposé of the druggist in his relation to advanced standards of preparation for the student; and I for one stand immutably opposed to such unfair demands on the young man or woman who takes up pharmacy as it stands to-day, now the business.

But let me add that when the physician, by his prescription will demand the theoretical knowledge and deep research of the pharmacist, in short, when the abominable practice of prescribing proprietary remedies, whose value the physician has small means of ascertaining ceases, and when he in person shall stop dispensing from his office, and only legitimately prescribe and continually discourage the use of "patents," will pharmacy be elevated to a profession and call for a deeper learning from the pharmacist: then I too shall acquiesce in the demand for higher qualifications of students of pharmacy.

ISRAEL LESSER, Ph. G.

[The weakness of our correspondent's position is exposed in his concluding paragraph: he seems to depend upon physicians to reform pharmacy by writing prescriptions which no one but an educated pharmacist can fill, and yet says that a pharmacist need not be educated up to the point of being able to fill such prescriptions. Hasn't he placed the cart before the horse? Should not men prove their ability to do certain work before asking that such work be entrusted to them?—Editor THE DRUGGISTS CIRCULAR.]

In Defense of the Big "Cut-Rate" Stores.

By the River, March 21st, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Your Chicago correspondent's remarks in March (page 148) provoked me to answer. In his closing paragraph he says that we (the drug clerks) should discourage giving our services to cut-rate stores and also discourage the doing of porter work by registered pharmacists.

Well, it seems to me the best way to discourage porter work by registered pharmacists is to give our services to "cut-rate" stores, who seem to be the only ones able to pay for having such work done by porters.

Let me give you a few facts.

Up to fourteen years ago I had the usual drug clerk's experience—long hours, Sunday work, soda fountain and porter drudgery, and errand boy jobs with frequently a night bell to rob me of my hard-earned rest, etc., etc., with varying wages of from \$18 to \$25 a week. Then I got a position that seemed full of promise. A "new idea" pharmacy was established, thoroughly ethical, no "patents," only prescriptions and sick-room requisites, with chemical, bacteriological and x-ray laboratories, and we started off with a grand hurrah; but unfortunately the "ethical" doctors did not rally to our support sufficiently to make a "go" of the venture, and within a few years the owner's faith in the idea that a real pharmacy would pay was entirely broken up by the failure of the business. The hours of a near-by "cut-rate" store attracted me (for even this kid glove pharmacy's hours were very long and included alternate Sundays), and the opportunity of having my evenings and Sundays to myself was too much of a temptation and I went over to the "enemy."

That was twelve years ago, and I have never regretted that move for an instant; in fact, it has given me an opportunity to develop such as I would not have had if I had remained in the ordinary store. During this last twelve years' service I have gone steadily forward in salary and increased responsibilities until at present I am superintending a number of stores, hiring the help, and overseeing a sales force of about two hundred people. I have a financial interest in the business and am treated with consideration as one of the factors in its success. I can not say that I have any unusual ability, unless it be the ability to work hard and be on the job.

My advice to the drug clerk who is tired of the long hours and disgusted with unprofessional work is to drop the ethical fetich and get right into any live department or cut-rate drug store and plug hard.

This is a commercial age. We want people who know the drug business, yes; but we want men who have business instincts as well. It is an undeniable fact that the average-druggist is not a business man. Go into any drug store and ask for quinine pills, and see if the clerk or proprietor does not ask you if you want about 5 cents' worth. Or ask for glycerin, and the question will be, "I guess 10 cents' worth is about all you need, isn't it?" Look at the display windows. Are they inviting? Can you usually find the proprietor in his store during business hours? Ask the traveling salesman. Now contrast the "cut-rate" store's manner of doing business. If a customer goes into a "cut-rate" store for quinine pills or glycerin, if he does not come out with a hundred pills or a pound

of glycerin it will be because the clerk persuaded him to buy more than that.

The tendency of the times is to concentration of capital, and the "little fellow" in the drug business has an increasingly harder road to travel.

I can truthfully say that our clerks have better hours, better pay, and if not easier work it is real pharmaceutical work and not mopping floors or dishing ice cream. They are contented and happy and they have sufficient time to devote some of their hours to pleasure.

In conclusion let me say that the big "cut-rate" stores, which do the drug business of this country, offer the best opportunities for the young man to learn business methods if he wants to engage in business for himself at some future date, or afford him the chance to advance in salary and position if he does not care to embark in the uncertainties of a business career.

H. G. S.

[Referring to the concluding paragraph of the foregoing, we may say that we fail to see how a man who is simply a cog in a wheel in a big machine thereby receives training which will fit him to become the whole machine. The smaller the store, within reasonable limits, the better the opportunity of the clerk to learn all about business methods.—Editor THE DRUGGIST CIRCULAR.]

A Physician Tells When His Fellow Physicians Should Dispense.

Cincinnati, Ohio, March 27th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

Will you permit a few words from another physician, in regard to the question, "Should doctors be allowed to dispense?" As a matter of fairness to all concerned, a matter for which your journal is notable, I wish to say that there are a few points which have been consciously, or unconsciously overlooked. Dispensing on the part of physicians had its origin in part, at least, with the homeopathic physician. Whatever may be the opinion of the individual in regard to homeopathy, there are three facts which should be more generally recognized.

First, homeopathy has existed as a recognized method of medical practice among intelligent people for over a hundred years.

Second, the results obtained in homeopathic practice compare very favorably with those obtained by practitioners of other schools.

Third, homeopathy deserves a large part of the credit for the reduced size of the modern dose, for the tablet triturate, etc., and the use of the single remedy. Now this is not a plea for homeopathy, but the plea of one who has a point to make.

Dispensing on the part of the homeopath is allowable and proper for this reason: The homeopath dispenses a single remedy, provided for him by a reliable house, in a simple menstruum or upon sugar disks; no pharmaceutical knowledge of reactions, compatibilities, etc., is necessary in such dispensing, the questions of dosage and the choice of a proper remedy being the only ones to be settled, and these the qualified physician alone is truly competent to decide.

So, the question, "Should the physician dispense?" resolves itself to this: When the preparation dispensed is a mixture or combination of two or more

substances, the prescription should most assuredly be prepared and dispensed by a capable pharmacist, or at least by an individual who thoroughly comprehends the chemistry and therapeutics of the compounds or mixture to be dispensed. In the case of a prescription, which consists of a single remedy and its vehicle, the physician, as shown above, certainly is within his rights when he dispenses.

Both the druggists who prescribe and the physicians who dispense are numerous, and in the magazine articles published so far it has been too frequently a case of the pot calling the kettle black. In the spirit of fairness, why not discriminate, instead of making sweeping assertions, which are bound to be unjust to some, at least?

CHARLES R. BUCK, M. D.

Opposed to Trying to Sell Stamp Customers Anything Else.

Newark, N. J., April 19th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

To ask a customer, "Is there anything else you would like to have?" when selling him a stamp, is a veiled attempt to sell him something.

The purchaser of the stamp, if very sensitive, will buy something although contrary to his intentions; and if he is not very sensitive, he will ignore the request and will reply in the negative.

Stamps are sold for accommodation only, and with no pecuniary purpose. Accommodation, in all its forms, as applied to business, is the best advertising, especially to a business that cannot afford to pay for its advertisement. When one *forces* immediate returns for his accommodation by resorting to such remarks as "Is there anything else you would like to have?" regardless of when or how often used, he not only infringes on the rights and expectations of a customer to be accommodated, but he loses his best medium of advertising.

M. OLSHIN.

Improvement in Drug Clerks' Conditions.

Charleston, S. C., April 16th, 1911.

To the Editor of THE DRUGGISTS CIRCULAR:

I have been a constant reader of your journal so many years that I feel a proprietary interest in it.

I am not a drug clerk, having been in business for a number of years, but I was a clerk first and served eight whole years as such before I aspired to the ownership of a store.

Because I was a clerk in the days when our lot was harder, our hours longer, and pay less than now, I have a feeling of impatience at some of the complaints I read each month. In September of this year I hope to celebrate the thirtieth anniversary of my entrance into pharmacy. When I had been at work about a year I read with great interest a series of letters in your columns written by a retired druggist, whose name I think was H. M. Stone. In his letters he told of the days when he began to work, the hard tasks expected of him and all clerks in those days, and the small pay received and few privileges obtained. At that time I compared my lot with his and marveled at the changes the years had wrought. For many years after that when I felt like complaining at the things required of me I would think of Mr. Stone.

Now, after nearly thirty years' experience, when

I compare the present lot and condition of drug clerks with those of the clerks in the days when I was a junior, I think the present conditions a great improvement. Then I pick up a copy of some drug journal and read a biting, scathing diatribe written by some discontented clerk arraigning his employer as an inhuman monster trying to grind out of each clerk every ounce of endeavor and then throw away the worthless carcass.

I admit that pharmacy is a very exacting mistress, and to the half-hearted disciple she must seem unreasonably exacting. That same axiom applies to every calling in life, however. If a man chooses dentistry and then finds its exactions disagreeable and unpleasant, he can readily decide he has made a mistake and is in the wrong profession. This same rule applies to pharmacy, and when a clerk comes to me complaining of different features of the business as being disagreeable I quickly inform him he is in the wrong profession, and advise him to change to something more to his liking.

In the matter of clerks I have always been fortunate, in that the young men I have employed have been generally ambitious; in fact, four of them are at present practicing physicians, having gone from pharmacy to medicine.

The gist of the whole matter is this: every man is the architect of his own fortune. The successful men, wherever you find them, are those who do not stop to worry about the hard places, but are continually pushing ahead and rising above these annoying and vexing things. This applies forcibly to pharmacy. The clerk who instead of worrying about the unpleasant features is studying how he may improve and help business and further his employer's interests is the one who progresses. The way for him to get more pay is to increase business and to make himself more valuable. The same plan shortens his hours, for more business means more help in the store, and the resulting more favorable arrangements of hours for all concerned.

F. E. DUDMAN.

Still More Board Questions Answered.

Following up the subject of curious answers given by board examinees, we are herewith presenting a number of such answers. In the CIRCULAR for March, page 151, appears the introductory article on this subject, and in the issue for last month, page 209, was a second installment of these answers.

New York.

A. Benzoated lard is made by mixing benzoin with bird gravel, then suspending it in hot lard and straining this.

A. A styptic works upon the spinal column.

A. A styptic enlarges the eye.

A. Styptics are adhesive substances.

A. An inorganic emetic means a salt that will absorb water.

A. Efflorescence means a rose bush in full bloom.

A. Deliquescence means leaving the cork out of the bottle.

A. The official part of koo-soo is pumpkin seed.

A. Plummer's pills are made of lead.

A. Gum opium contains 90 per cent. of morphine.

A. Powdered opium contains 50 per cent. of morphine.

A. Succulent means sucking nourishment from other plants.

A. The definition of alum is to pucker.

A. Part used of benzoin is the root.

A. Camphor is derived from coal tar.

A. Official part of wormseed is turmeric.

A. Serum comes from sage and the seeds of fruit.

A. The official title of oil of vitriol is phenol liquifacatum.

A. Active principle of aconite is niter.

A. Active principle of opium is morphine, cocaine and strychnine.

A. Spirits of mendereris is made of 33⅓ per cent. lunae caustic and 66⅔ per cent. potassium nitrate.

A. Official title of hive syrup is mel.

A. An aperient is something that eases the feelings of a person.

A. The follicles are a part of the body of certain animals like the musk pod of the deer.

A. Cod liver oil is the product of the mammalia.

A. Spartine is derived from spermaceti.

A. Succulent means an excess of bile.

A. A mechanical antidote is lemonade.

A. A supurific is soap tree bark.

Q. For what kind of poisoning should fats and oils not be used?

A. Fats and oils should never be used when the poison is alkalize—as they alkaloyd themselves.

A. Cetaceum comes from bees.

A. Cetaceum comes from the hog.

A. Cetaceum comes from spearmint.

A. Cetaceum comes from the yolk of eggs.

A. Bromine is obtained from urine.

A. Bromine is obtained from the mountain regions.

A. Menthol is derived from wintergreen.

A. Parts used of nux vomica are roots, leaves and tops.

A. 3 drams of cocaine at \$4.50 per oz. would cost 12 cents.

A. Oleic acid has flakey, white glossy appearance.

A. Oleic acid comes from lime fruit.

A. Oleic acid comes from the stomach of a pig.

A. Oleic acid comes from mercury.

A. A lethal dose is given by the rectum.

A. For morphine poisoning give morphine and give it often.

A. Pharmaceutical title of marshmallow is burdock root.

A. Fixed oils are those fixed by the U. S. P.

A. Active principle of monks hood is monkshoodine.

A. Ammoniated mercury is made by mixing mercury and muriate of ammonia.

Pennsylvania.

Q. Name four preparations containing mercury in the metallic state?

A. Mercurial ointment, basilicon ointment, corrosive sublimate.

Q. Give the official Latin name for Donovan's solution.

A. Tr. iodine compositas.

A. Spts. Mindereris.

A. Purified aloes is made by grinding up the drug and passing through sieves to obtain fineness.

A. Thymol is taken from thyroid glands.

A. Deodorized tincture of opium is made from the fluid extract.

A. Deodorized opium is made by treating it with alkalies.

A. To ascertain the value of crude opium, is to powder it.

A. When rubbed across a piece of white paper it should make an uninterrupted line.

A. Powdered opium is much purer, but not stronger than the crude.

A. There is no difference in the strength of powdered and crude opium, the reason for using the powdered opium in making laudanum, is that you can extract all of the properties much easier than from the crude.

A. The difference in strength between the crude and powdered is from 10 to 15 times stronger, so that if you make a pint of laudanum from the crude you will use 29 grains of the powder and about 300 grains of the crude.

Q. Why is it customary at college to learn just enough to pass examinations?

A. Because it seems to be enough until we hit the State board.

A. That is up to the individual, I only made sufficient myself, but if the rest of the class had to contend with what I did this year, probably we would of had one or two more sufficient in our class . . . numerous other things, I do not care to mention. But its over now, so there is no use worrying. Is there?

Illinois.

An old-time Illinois examiner writes: "I asked a candidate to define the word 'pharmacy' and his answer was,

'A wooden sign-board used by some country stores that ain't no drug store.'

"In one of my oral examinations I asked when oxygen was discovered, when hydrogen was discovered, and then, to get an idea of the general intelligence of a candidate and what he knew about chemistry and history, asked him when water was discovered. He answered that it was discovered in 1779. When asked how he came to make such an answer, he replied: 'Well, at the school which I attended the teacher said that it would be better to answer wrong than not at all.'

Name of State Withheld.

A. An atom is a wait used in the metric system.

A. A molecule is also a wait used in the metric system.

A. A chemical symbol is a symbolic term used in chemistry.

A. An element is made up of both atoms and molecules to form a body, as calomel. [He came from Georgia.]

Q. Given I=126, and K=39; how many grains of I are there in 10 grains of KI?

A. $10,000 \div 126 = .071\%$. [Given by an experienced man from Iowa.]

Q. Give a chemical test for HgCl₂.

A. A nitrate.

A. [$\frac{1}{2}$ of $\frac{1}{2}$ was stated to be $\frac{2}{6}$.]

[The following answers to questions in materia medica and botany were given by a college graduate:]

A. The root of a plant is that part that grows in the ground to hold the plant erect; also supplies much food for it.

A. A rhizome is an exudation of plants from wood, bark, roots, usually gummy; example, opium.

A. A tuber is the small tips or twigs, the most tender and growing part of the plant; example, cloves.

A. Five official gums are opium, rosin, acacia, camphor [did not attempt the fifth].

A. Five official oils are ricini, tigtis, pine, cedar, bergamot.

A. Five official roots are cinchona, burdock, sassafras, cotton, colcocyth.

A. Five official leaves are [did not attempt to name them.]

A. Two official infusions [did not attempt this.]

Our invitation to board members and others to send contributions to this series of answers, is still open, and we should be glad to have it accepted by as many as have anything to send.

A Few Curious Answers from Other Sources.

Professor (examining medical student)—If you were called to a patient, what is the first question you would ask the messenger?

Student—Where does the patient live?

Flunkers—I don't think I deserve an absolute zero.

Professor—Neither do I, but it is the lowest mark I am allowed to give.

Miss Clara Evelyn McHugh, a teacher in one of the Topeka schools, says the *Chicago Journal*, read at a recent teachers' meeting from a collection of quaint examination answers that she had been gathering for some years.

The gems of Miss McHugh's collection were:

"A blizzard is the inside of a hen."

"The equator is a menagerie lion running round the earth."

"Oxygen is a thing that has eight sides."

"The cuckoo never lays its own eggs."

"A mosquito is a child of black and white parents."

He who works with his hands only is a mechanic; he who works with hands and head is an artisan; and he who works with hands, head and heart is an artist. —Ruskin.

Some Questions in Drug Store Mathematics.

Here are a few questions which may interest the drug clerk who wants to keep his knowledge of arithmetic bright until such time as he is ready to "go before the board." We invite clerks to send in solutions of these examples and also to contribute problems of a similar nature for publication here. In these examples official strengths, temperature, etc., are to be understood unless the contrary is specified:

1. If the expense of doing business is 20 per cent. of the gross sales, what net profit, in cents, is made on the sale for \$2 of a water bag that cost \$18 a dozen, less 10 and 5 and 2 per cent.?

2. If a lot of quinine sulphate loses $1\frac{1}{2}$ per cent. of its weight by evaporation, and the clerk wastes $2\frac{1}{2}$ per cent. of what is left in filling capsules, how many 5-grain capsules may be filled from a 1-ounce can of the salt?

3. If the freight rate on alcohol is 10 cents per 100 pounds per 100 miles, and a barrel of 50 gallons of alcohol weighs 400 pounds, would it be more economical for a druggist to pay \$2.70 a gallon for a barrel of alcohol on a market 100 miles away, or \$2.67 on a market 500 miles away?

4. What is the cost of the ingredients of 1 gallon of soap liniment, with soap at 30 cents a pound; camphor, 50 cents a pound; oil of rosemary, \$1.40 a pound; and alcohol \$2.75 a gallon?

5. The true leaves taken from a package of so-called belladonna leaves assay just up to the official requirement, but it is found that in the package there are 10 per cent. of twigs which contain only half as much mydriatic alkaloids as the leaves, and 5 per cent. of inert adulterant. What will the complete sample assay?

6. By retailing a box of 50 cigars at 10 cents each a druggist would make a gross profit of 25 per cent., but the clerk and the doctor each smoked one "on the house," the druggist gave one to a customer as a sample, and a dead-beat bought three and neglected to pay for them. What was the gross profit on what remained, at 10 cents each?

7. It being desired to dilute 6 official average doses of lemon juice with sweetened water so that 10 parts of the juice will be present in 100 parts of the finished product, how much of the juice and how much water should be used?

8. If $2\frac{1}{2}$ fluid ounces of a spirit weighs $1\frac{1}{2}$ apothecaries' ounces, what is the specific gravity of the spirit?

9. If $1\frac{1}{2}$ fluid ounces of a solution weighs $2\frac{1}{2}$ apothecaries' ounces, what is the specific gravity of the solution?

10. A quantity of salt is dissolved in a fluid ounce of distilled water, which is then found to weigh 470 grains. What is the percentage strength of the solution?

Answers to March Questions.

- \$36.96; \$29.41. (A year is reckoned as 52 weeks of 7 days each).
- 16.21.
- About 1/59.
- 8.93—.
- 9 pounds, 1 ounce, 192 $\frac{1}{2}$ grains (specific gravity of alcohol being reckoned at 0.809).
- About \$69.42.
- Stock solution, 2 drams, 33.6 minims; water 7 ounces, 5 drams, 26.4 minims.
- 66% grammes of the 7% sample, and 133 $\frac{1}{3}$ grammes of the $2\frac{1}{2}$ % sample.
- 0.872+ %.
- 10.2 grains of cocaine; 436.8 grains of water.

Answers to April Questions.

- 22 cents.
- 5.064+.
- Drug clerk; about 4 cents an hour. (The clerk receives about 23 cents an hour; the car conductor, about 19 cents an hour.)
- Clerk's earnings for eleven years, less college fees, \$69.70; physician's annual income, fifth to eleventh years inclusive, to make his earnings, less college fees and office expenses, equal those of the clerk, \$1593.
- Profit, first year, \$517.68; second year, \$7118.80.
- Stationery, \$180.
- About \$1.95.
5. (Water, 7 pints.)

- A small fraction less than 1 ounce.
- Potassium, 72.78 grains; iodine, 235.82 grains.

If anyone has any objection to the discontinuance of this feature of the CIRCULAR we should be pleased to hear from him.

Elixir of Cinchona.

The following formula is given for elixir of cinchona by Dung (*Pharm. Zeit.* through *Pharm. Weekbl.*):

Cochineal	7.5 grammes.
Star anise seed.....	7.5 grammes.
Caraway seed.....	7.5 grammes.
Cardamom seed.....	7.5 grammes.
Coriander seed.....	30.0 grammes.
Ceylon cinnamon.....	30.0 grammes.
Orange peel.....	60.0 grammes.
Cinchona calisaya bark.....	120.0 grammes.
Brandy	125.0 grammes.
Alcohol	500.0 grammes.
Water	1000.0 grammes.

Macerate for eight days, filter and mix the filtrate with 1250 grammes of simple syrup.

One of the principal differences between this formula and that of our National Formulary is that this one calls for simples while the one official with us calls for preparations made up from the same or somewhat similar simples. Of course, under the federal and many of the State laws, a preparation sold under an official name must be of official strength, quality, etc.

Three New Wart Removers.

I.

Resorcin	1 gramme.
Salicylic acid.....	1 gramme.
Calomel	1 gramme.
Wool fat.....	20 grammes.

II.

Glacial acetic acid.....	10 grammes.
Precipitated sulphur.....	20 grammes.
Glycerin	32 grammes.

III.

Alcohol	1 ounce.
Salicylic acid.....	enough to saturate.
Castor oil.....	50 drops.
Apply by dampening (warts or corns) twice a day.	

Barb-Wire Liniment.

Linseed oil.....	1 pint.
Saltpeter	1 ounce.
Sugar of lead.....	1 ounce.
Sulphuric acid.....	1 ounce.
Phenol	4 drams.

Mix cautiously, secundum artem.

This is not a lotion; it should be used sparingly, by applying with the tip of a feather.

Menthol Pencils.

Menthol	100 grammes.
Benzoic acid.....	10 grammes.
Eucalyptol	3 grammes.

Melt the ingredients together at the lowest temperature possible, mold the mass into cones, and allow these to cool in a covered vessel.

Fighting the Narcotic Evil.

Two physicians of San Diego, Cal., were arrested at the instance of the California Board of Pharmacy on a charge of selling morphine and cocaine to drug habitues. Both plead guilty and were sentenced to pay fines of \$250 and \$100 respectively.

A number of additional convictions have been secured by the Pennsylvania Board of Pharmacy in its crusade against the illicit sale of narcotics at Pittsburg. Many of those charged with the illegal sale of cocaine in nostrums offered the plea that they believed that the guaranty under the federal food and drugs act exempted them from the provisions of the State anti-narcotic law. In imposing the sentences Judge Marshall Brown severely censured the druggists for failing to keep informed as to the laws regulating their business.

On the appeal of a Savannah man convicted of selling cocaine contrary to the provisions of the State anti-narcotic law the Georgia supreme court has upheld the constitutionality of the act which restricts the sale of cocaine to the filling of physicians' prescriptions. There has been some difficulty in securing convictions of cocaine-prescribers in Atlanta and also of the druggists to whom the cocaine prescriptions were generally directed. Prosecutions under the law must be made by the county attorneys and must be sanctioned by the commissioner of agriculture and the attorney-general. The Atlanta Drug Association recognizing the unwieldiness of this procedure has called upon the wholesalers of the country to cut off the supply of cocaine from druggists using unnecessarily large quantities.

The grand jury at Toledo, Ohio, recently issued a formal warning to the druggists of that city stating it to be the intention of the prosecutor's office to deal severely with illegal sellers of narcotics. The Ohio Board of Pharmacy is carrying on a State-wide crusade against illegal drug-sellers. Several of the local branches of the Ohio Pharmaceutical Association are aiding the authorities to secure convictions. A Cincinnati druggist has been convicted and fined \$50.

Legal assistance has been secured by the Retail Druggists' Association of Dallas county (Texas) in an endeavor to prevent the illicit sale of narcotic drugs in the territory of the association.

At Portland, Ore., the police have been waging war on the peddlers of narcotics. Several sellers of cocaine have been apprehended.

Would Wipe Out "Patent" Medicine.

"Would not your interpretation of the pure food law break up the patent medicine business?" inquired Justice Lurton of Solicitor-General Lehmann, during the argument of the Johnson case, involving alleged misbranding of medicines, to-day, says a press dispatch from Washington, dated April 13th.

"It probably would, and I know of nothing within the scope of congress that would be more beneficial," answered the solicitor-general.

The Deadly Wood Naphtha.

Five persons died at Horton, N. Y., several weeks ago as the result of imbibing diluted wood naphtha for purposes of intoxication. The newspaper reports have it that the spirit was obtained from a druggist of a neighboring town by one of the victims who it is alleged asked for alcohol to be used as a beverage.

Three members of a Brooklyn (N. Y.) concern were convicted recently in the local federal court on a charge of selling beverages containing wood naphtha. The criminals were sentenced to pay a fine of \$250 each and to serve prison terms of nine, four, and three months respectively.

Suit has been brought in the federal district court for Rhode Island against a Westerly drug firm, in which a widow seeks to recover \$10,000 damages for the death of her husband which she alleges was produced by his drinking "whisky" containing wood naphtha sold by the defendant concern. It is reported that more than a dozen proposed cases of a similar nature are awaiting the outcome of this suit.

Fritz Lueder, of Peoria, Ill., has been appointed a member of the advisory board of the University of Illinois School of Pharmacy to succeed Frank Thomas, of Cairo.

New York City to Have a New School of Pharmacy.

Plans are fast nearing fruition for the opening of a department of pharmacy in connection with the Fordham University School of Medicine in this city. Were it not for some delay in the construction work on the new building for the medical school all arrangements would now be definitely settled. As it is, the new department will be opened when the medical school year of 1911-12 begins in September.

It is largely through the efforts of Dr. V. E. Sorapure, pro-dean of the medical school, that this new venture is being embarked upon; and the pharmacy school will be under his supervision. To a member of the CIRCULAR staff Dr. Sorapure spoke of the purpose of the projected school as being to make pharmacists of high scientific and professional attainments, and not to make money. The Doctor is firm in his belief that there is a growing demand among the more enlightened members of the medical profession for a class of pharmacists who are able to relieve the physician of the technic of laboratory diagnosis. Dr. James J. Walsh, the dean of the Fordham medical school, has publicly expressed the same views. It is not to be wondered at then that the curriculum and the requirements of the new department of pharmacy have been arranged with the view of supplying the aforementioned demand.

In the faculty of the new school the chairs of chemistry, anatomy, physics, physiology and biological chemistry, and bacteriology will be filled by the men occupying similar positions in the medical faculty. In a like manner the lecturers in clinical pathology, botany, and zoology have been selected. The lecturers in materia medica, experimental pharmacology, pharmacy, and food and drug examination have yet definitely to be chosen.

The courses to be given to the students of the proposed school will lead to two degrees: that of bachelor of pharmacy, and that of doctor of pharmacy. The bachelor's degree will require attendance during three full terms aggregating 1,475 hours of instruction. The doctor's degree may be obtained in a four years' course or a special three years' course. It will be required of candidates for admission that they have a pharmacy student's certificate from the regents of the University of the State of New York, and that they be of good moral character. To receive the bachelor's degree the student will be required to pass examinations in the subjects embraced in the curriculum, and before beginning the third year of study, to pass the examination in English or logic required of students finishing the freshman year in a university recognized by the regents, and to be twenty-one years of age. The doctor's degree will be conferred upon students who have satisfactorily finished the course provided in the curriculum and have before the beginning of their third year passed an examination in English, Latin and logic as required at the completion of the first-year term in a recognized university.

The subjects of instruction will be:

For the bachelor's degree—General, analytical, organic, and pharmaceutical chemistry, physics, botany, zoology, materia medica, pharmacy, bacteriology, experimental pharmacology, food and drug examination, and clinical pathology.

For the doctor's degree—The same subjects allotted to candidates for the bachelor's degree together with physiology, physiological chemistry and hygiene; attendance at anatomy lectures, demonstrations and recitations will also be required.

Chains of Stores Growing.

The sixth store of the Owl Drug Company at San Francisco, Cal., was opened April 1st. The seventeenth store in the Owl chain will be opened at Sacramento, in July.

A Riker drug store is being opened on one of the principal corners of the main street at Trenton, N. J. So far this is the southern limit of the Riker chain which has links as far north as Massachusetts. Springfield is the latest city in that commonwealth to be selected by the Riker concern.

It is announced that by the sale of red cross Christmas stamps last year in New York State outside of this city and Buffalo the amount of \$31,160 was secured for anti-tuberculosis work.

DRUG STORE ADVERTISING

By M. P. GOULD, of New York

In this department some of the fundamentals of successful drug store advertising will be expounded each month. The aim is to correct errors of advertising and establish the most profitable and advisable methods of building up retail drug trade by means of the powerful influence of advertising.

Advertising as an Adjunct to Selling.

There are no fixed, clearly defined laws of selling or of advertising. Albeit I have heard many arguments in favor of the "science" of selling and many arguments in favor of the "science" of advertising, after hearing them all, I am ready to repeat that as far as I can see, there are no clearly defined, fixed laws of selling or of advertising. Few, if any, will contend that there is a science of painting; that there is a science of music, of oratory, of personality. These things are all fine arts. They are not sciences.

In regard to selling and advertising, the best that can be done is to catalogue observations, describe experiences, and analyze accomplishments. That is but another way of saying that advertising as well as selling is largely a matter of personality.

No matter how important may be the position that some other man holds, it seems to me that one of the most important things in the advertising business to-day is that each man think clearly and accurately, with his own observations and experiences as a foundation.

It seems to me to be an error to pay too much attention to the principle that everybody should "boost the game" no matter what phase of the game may be played. Advertising is not a beautiful butterfly which will be killed if you touch its wings, neither has it a made-up complexion that will be ruined by a bath.

One of my reasons for selecting my present subject, worded exactly as it is, was that I thought that possibly I might be of service to some advertiser in stating my views regarding "selling as an adjunct of advertising." Manufacturers and advertising agents with whom I have discussed this subject have without exception said that any attempt to make selling subservient to advertising is unwise, nonsensical, preposterous.

In discussions of this kind there is always the danger that, while one speaker will be talking about advertising and the other speaker will be talking about advertising, the two speakers will not be talking about the same thing. There are those who say that selling and advertising are

one and the same thing. Perhaps an advertisement in a magazine induces a man to buy a talking machine, and that man likes his machine so well that he recommends it to six of his friends. Those six friends each go and buy a similar machine and in turn each influences six others to buy machines of the same make. The result is that one advertisement sells forty-three machines. That is what is called cumulative effect in advertising. But suppose that after the first man had purchased a machine, he had not liked it, then he would not have persuaded his six friends to buy that machine, and those six friends would not have persuaded their thirty-six friends to buy that machine. One sale would have been made instead of forty-three. What is that: selling or advertising?

There was the same advertising; but there was not the same selling. Selling is not advertising, nor is advertising selling. In the first case there was one sale made by advertising and forty-two sales made by selling. In the second case there was one sale made by advertising and no sales made by selling.

A good many years ago I learned that the same results could not be expected from the same advertising used by two different retail stores, both stores being influenced by similar conditions and using the advertising matter under similar conditions. The reason for this was that one store had back of its advertising a long line of good store management, of good service to its customers, of progressive methods in retailing, and the advertising was merely a description of its methods, a true photograph of the store. The other store had been backward, unprogressive, giving unsatisfactory service to its customers. The conclusion of some people with regard to this situation would be that the selling in the first store being an adjunct of the advertising made that advertising successful; whereas the lack of selling as an adjunct of the advertising of the second store made its advertising a failure. That is not the correct conclusion, because—and I have seen it in hundreds of cases in retail stores—the first store with its progressive methods had made a success of selling practically without advertising, while the second store doing several times as much advertising had never been able to make its advertising pay.

Right here let me say that there is nothing in this whole country that we need so much as clear and accurate thinking. In every line of industry and in every line of activity, we have so many "special interests" that it is often very hard to get at the facts. I do not mean to say, or even infer, that it is not perfectly proper for the newspapers to try to get as much of a manufacturer's appropriation as they can. Nor do I think it is improper for the magazines or bill boards, electric signs or street cars, fence signs or novelties, moving pictures or printers, sample distributors or other publicity mediums each and all to get as much of the appropriation as they can. However, after

the arguments of all of the legitimate and perfectly proper "special interests" are in, then it is up to the manufacturer or his advertising agent to analyze all arguments and determine which is the particular line of advertising and selling that will bring the most results for the least money. In the eyes of some it might be rank heresy for one to say that it is the duty of every advertiser and every advertising agent not to try to create the largest advertising account, but to strive for the largest results with the smallest adequate advertising appropriation.

The talking-machine business has grown with enormous strides. It would be an easy way to credit its suc-

The man who puts up your medicine is the man who guards your health.

The result of medical treatment depends largely upon the quality of the medicaments, and the manner in which they are prepared. It is the man who puts up your medicine that guards your health. On his knowledge of drugs, his care in the selection of them, and his skill in compounding, your health depends.

Bring every prescription direct to us and be safe, in that it will be compounded with the right ingredients and as the doctor wishes. The results that follow its use are those to be expected by the doctor.

(Name and address)

cess to advertising alone. However, anybody who has ever had a glimpse of the tremendous things that the talking machine people are doing, how they are getting the greatest artists in the world to produce records, will know that advertising is only the out-croppings of the golden ledge to show the prospector where to dig. First of all it is the actual achievements of the management which have made the success. Secondly, it is the selling organization. Thirdly, it is the advertising which has interested the public in those achievements, which has put the cap-stone on the success. To say that the advertising would have made the success without the selling is foolish; to say that the selling could have brought the success without the achievements of the factory would be foolish; to say that the selling should be subservient to the advertising is in my opinion also foolish.

It is said that \$135,000,000-worth of automobiles were sold in this country last year. I am told that the highest-quality automobile company in America divides its gross receipts into three parts: One-third for manufacturing the cars; one-third for selling them; and the other third for profits. Anybody who knows of the elaborate methods of selling employed by this company knows that it is the selling that makes the business—with the assistance of the advertising. The selling is not subservient to the advertising. The advertising is an adjunct of the selling. There is another automobile company selling a high-class car, which spent \$6,800 in New York newspapers last year and sold \$450,000 worth of cars in New York city. Anybody who is acquainted with the methods used by this company knows that their advertising was a secondary, although a very essential, part of the plan. I do not contend for one minute that those successes could have been made without the advertising. I merely say that the advertising was subservient to the selling methods.

The old bicycle business was a gloriously advertised business. It went to pieces. Some people think it went to pieces because a "trust" was formed and the advertising was stopped. My understanding is that the "trust" was formed for the purpose of saving the business, because, as a whole, it was in such a precarious condition. The bicycle business would probably have gone "down and out" if a number of men who were interested in a particu-

BUGS

ARE A

BOTHER

BUGS are a nuisance and a pest; they are not at all an essential part of the domestic economy, despite their ubiquitousness. Bugs in the beds, bugs in the carpets, bugs in the rugs, and bugs in the clothes; they are apt to be on hand at this time of the year.

We have all the popular brands of bug destroyers for *ants, roaches, bedbugs, moths, fleas, mosquitoes, chinch bugs, potato bugs, and flies*; new goods with all the power and action of freshness, some in liquid, some in paste and some in powder form; put up in all sizes of cans and packages, so that you can have as much as you want or as little as you want.

The popular anti-moth preparations are all here: camphor, cedar chips, paper wardrobe bags, etc. Insure yourself when you pack away your winter furs and clothing, and know that you will have them ready and in good condition next fall.

Start early to wage unceasing warfare against the pesky, disease-disseminating house fly. Get your ammunition here: fly paper, fly traps, pastilles—we have the full armament.

(Name and address)

lar part of the bicycle had not gotten together and worked for the upbuilding of the trade, in order that they might have a market for the part of the bicycle which they made. Their methods were not spectacular; they did not squander a fortune in advertising. They took off their coats and rolled up their sleeves and went to work on the A B C methods of selling.

The result has been that for the last four or five years we have seen practically no advertising of bicycles. Therefore many uninformed people have thought that the bicycle business was dead. It may be astonishing to know that one firm last year sold 75,000 bicycles; that there were sold in the United States last year 485,000 bicycles, a larger number than was ever sold in one year in the very heyday of the bicycle "craze."

Now the bicycle business having been put on a firm foundation, bicycle advertisements are appearing in magazines, mail-order journals, newspapers, and every other form of advertising mediums. I said to a manufacturer a short time ago, "The bicycle business is coming back." His reply was, "Wake up! It's already here."

So it has been in the shoe and leather industry, in the knitting industry, and the textile industry: selling methods have come first, and sometimes the part played by advertising has been a rather minor one. Some concerns have got along better on the strength of their selling systems alone than they have with the assistance of advertising. The reason for this, as I see it, is that the men superintending the advertising did not understand the proper relation between selling and advertising. Manufacturing concerns were employing expensive sales forces. To them have come advertising men who have opined that by cutting 25 per cent. off this expense and investing the remainder entirely in advertising, the sales force could be dispensed with. That was foolish advice. Practically every manufacturer who has tried it, soon realized his mistake. The next thing was that some advertising man went to the manufacturer and said, "This is the plan of advertising that I should suggest. Take your whole selling force and make them help you put this plan of advertising into operation." This plan has been tried by some manufacturers and in some cases it also has proved a failure. Why? Because the salesmen had grown old in the business. They have not been able to change

their methods and become enthusiastic advertising men. The methods which have proved most successful in the past, and the methods which are proving most successful to-day, and in which will be the greatest line of development in the future, are those methods which first of all recognize the possibilities of the goods to be advertised; that organize a selling force which could put those goods on the market successfully without advertising, and organize an advertising department that will put more life and more vitality and more efficiency into that selling organization, helping every salesman to sell more goods, using advertising as a powerful lever with which to increase the amount and the profits of his sales.

Not a word that I have said here has been meant as a hostile criticism of advertising. Far from it. I want advertising to come into its own. I want every manufacturer and every retailer to advertise so successfully that he will believe in advertising as I do. When that time comes, it will not diminish the amount spent for advertising; it will double it, yes, quadruple it, because advertising will be continuous not spasmodic, and the returns will be adequate.

The Traveling Drug Salesman.*

By ONE OF 'EM.

"You traveling salesmen certainly have a snap," is a phrase that I'll wager every "Knight of the Grip" has had passed up to him at least twelve times a year for every year he has been on the road.

The "Boys" have long since given up the task of trying to explain how it is possible for us not to have a "snap," therefore simply answer "Sure," and let it go at that. This answer, however, only convinces this individual at large that his reasoning powers are in prime condition to weigh such weighty matters, and it is the intention of the writer to enlighten such folks on this interesting topic.

Do not think for one moment that the writer has taken a day off to scribble this article, for such is not his good fortune. It has been written by bits while riding on trains and waiting at depots for late trains.

Delayed trains are occasionally experienced; in fact, they have a happy faculty of being late at all times. This, however, is only a slight inconvenience, as it only necessitates your "hanging around" the depot from twenty minutes up to two and three hours. (The other day the writer waited at Exeter four hours and ten minutes and only had to ride seven miles.) Of course, the agent doesn't come right out and say "four hours late." He just says 20 minutes late and you sit and wait. At the end of twenty minutes you note no engine comes thundering down the track, nor can you even see the headlight, so you again inquire. This time it's "reported 45 minutes late," and so until the train does finally arrive. Many is the time you miss meals by just such actions.

The average working hours of a commercial salesman are from seven in the morning until nine at night. This allows for eating early breakfasts, catching early trains, writing up orders and answering correspondence after supper and for riding on late trains in order that you may "make" the next town on the following morning. This for six days a week. After working all week under such conditions you will naturally conclude that his Sundays were a day of rest—but listen. If he is working for a large commercial institution he will find a large wad of mail awaiting his arrival on Saturday night. This wad includes general correspondence, instructions from every department manager and about fifty new price sheets that you have to get on speaking terms with before filing same away in your "28 pounds of printed matter."

You would hardly be so cruel as to expect him to arise at seven o'clock on Sunday morning, so with your kind permission he "hits the floor" at about eight-thirty o'clock, shaves, dresses, breakfasts and hangs around the lobby talking to the clerk, some of the other "C. S." or reading the local papers. Luncheon is soon eaten and over with so he can tackle the above mentioned "wad" and so occupy the balance of the day. In the evening he may visit a ten-cent moving picture show.

Friends—yes, you get acquainted with a number of buyers, clerks, hotel managers, clerks, call-boys, waiters and waitresses, bus drivers and a number of railroad conductors. You get so well acquainted you call them all by their first name (excepting the buyers), but you have not made any social friends whom you can call upon with your wife

or lady friend, as would be the instance when living at a permanent place. You never spend any evenings at home, whist parties, theatre parties or the such. In fact, you spend a great many evenings at the depot waiting for late trains.

By the way of recreation you have the "call-boy" appear every morning at your door, bang away and yell out, "Five o'clock," or whatever the appointed hour may be. You eat breakfast anywhere between 5.30 and 7.30 A. M., luncheon between 11 P. M. and 2 P. M., and dinner any time after 6 o'clock. Absolutely no schedule of regular hours at all; in fact, sometimes you only eat two meals a day; you live in and out of a suitcase and never know what it is to have a nice, cosy flat or comfy cottage. Most of your "days at home" are spent at hotels with the pitcher and bowl combination, and needless to say, the water is always cold, and especially in winter.

The meals are what the "natives of the town" pay twenty-five cents for and for what you pay fifty. The rooms at \$1 a sleep are what you would hesitate in paying \$6 a month for in any large city.

Mail you expected at Stockton has been forwarded on to Merced, and by the time you reach there you are advised that it has either been reforwarded further down the line or back to point of origin. Nice, isn't it?

When business is good, those sitting behind desks in the house will tell you how they have increased the volume of sales over the same period of the previous year, but when business is quiet they will tell you that the "men on the road" are not giving their particular commodities any attention.

Some days business is good, then you feel like a two year old—some days it is only fair, but you nevertheless think of "Billiken;" and then some days it is fierce, or so fierce—but what's the use of trying to describe a commercial salesman's degrees of feeling. There are too many of them not to mention colorings such as blue, green, red, etc.

Some days you have indigestion, some days toothaches, and other days, other aches. Some days the buyer is a perfect gentleman, some days he's a—well anything that isn't. Some days you wait but two or three hours to interview him and then some days you wait and wait, even if the only afternoon train does leave in an hour.

Some days it is rather warm, about 115 degrees in the basement and then there are days when you hate to disturb the water in the pitcher for fear of getting it all over the nice carpet, when breaking it with the soap dish. Fine weather this to shave in.

Yes, summarizing the whole situation I believe some "traveling salesmen certainly have snaps."

P. S.—Any young and innocent clerk wishing to go on the road can secure additional inside information by addressing the writer care of *Retail Druggist* and enclosing a 2-cent postage stamp for reply.

Some Legislative Efforts.

Senator Owen, of Oklahoma, has reintroduced his bill to provide a more efficient federal supervision of matters of public health through enlarging the scope of the public health and marine-hospital service.

Representative Turley has introduced another bill in the New York legislature. This time he is seeking to regulate the dispensing of prescriptions and the measure he is fostering provides that a statement of all the drugs included in the medicine must appear on the label, together with the license number of the compounder. The bill to limit the sale of hypodermic syringes to physicians and dentists has been passed by both houses.

Pennsylvania law-makers are threshing over quite a crop of pharmacal measures. For obvious reasons the greatest amount of newspaper publicity is being given to the several bills that provide for the publishing of the formulas of nostrums. The proposed new pharmacy law and the professional education prerequisite bill are being given much attention in drug circles.

Saccharin Tabooed.

A fiat went forth from the federal board of food and drugs inspection April 28th forbidding the use of saccharin as a sweetener in foodstuffs after July 1st. This edict is the outcome of the investigations by the referee board of experts.

*From the Retail Druggist.

SODA WATER SUGGESTIONS.

Plant a Tree.

In these warming-up days the soda-water man should get in at all points on the growing thirstiness of the public. He should make the most of his most strategic and advantageous plan of attack: the window show. Our suggestion for this month's attracter of passing thirsty ones is the following:

Get a tree or at least a goodly bough, one with an expansive spread of branches and plenty of "points" (as they say in describing a pair of antlers). "Plant" this tree securely at a suitable point in the window. By means of thin wires and thread fasten as naturally as possible on twigs and branches fresh or artificial fruit of every sort: Pineapples, oranges, strawberries, cherries, bananas, grapes, every sort of fruit obtainable. Then glue on a variety of leaves (these may be cut from green paper of various shades) enough to give the tree the appearance of life, but not so many as to conceal the fruit.

Cover the floor of the window space with a layer of green-dyed saw-dust, and scatter a medley of fruit and leaves on this ground. At each end and along the back of the window floor set natural or artificial flowers in beds or in pots. For the background use a light-blue cloth hung with sprays and festoons of blossoms.

Place prominently in the foreground a large white cardboard decorated with pasted-on flowers or pictures of flowers and bearing this legend:

```

.....
:           The Ever-bearing           :
:           Tree of All Fruits.         :
:   Your favorite fruit is always in season :
:           at our fountain.           :
.....

```

Stick smaller cards on wires in the grass, and place some more in the tree. On these have the names of fruit drinks, a descriptive adjective and the price. These cards may well be decorated with fruit and flower pictures.

A Rocky Story from the Rocky Mountains.

E. L. Scholtz is one of the most successful druggists in the West. He is president of the Scholtz Drug Company, owning a chain of something like half-a-dozen stores at Denver. When approached on the soda question by the CIRCULAR, Mr. Scholtz side-stepped by saying that nothing he could offer would be of any advantage to the business at large, as so much depends upon purely local conditions.

Mr. Scholtz did "loosen up" a bit, however, and uttered a few words of wit and wisdom apropos like this: "Of course, we encourage the introduction of new drinks after they have been well tried out, but no matter what we might suggest to you, statements by your readers to the effect that we did not know our business would not be lacking. For instance, when I am in New York I go into the stores where the best fountains are, and ask for a mixed drink of some kind, and receive something entirely different from that which is sold under the same name in our city. In case I commence a conversation with the man behind the counter I soon learn that discretion is better than my knowledge, because he will beat me out of my position with the superiority of his information on the subject, showing clearly that the man behind the counter is the boss of the situation. I had a very amusing experience at the fountains of a big New York chain store last fall which taught me to keep still on the soda water subject."

Two Contributed Formulas.

Parker's Pharmacy, Dorchester, Mass., enjoys a good demand for two fancy concoctions, and Mr. Parker is kind enough to tell, as follows, how he makes them:

Maple Royal.

Place two nabisco wafers side by side on a plate. On one drop a small scoopful of vanilla ice cream; on the other, a similar quantity of chocolate cream. Over the whole pour some maple syrup.

Pickle-Lime Soda.

Into a mineral glass put a small scoopful of cracked ice. Over this squeeze half a lime, dropping in the rind. Add an ounce of lemon syrup and fill with plain soda. Serve with two straws.

Soda and Lunches "While You Wait."

"If we were asked to give in the fewest possible words the mainspring of our success in the soda business," says C. B. Heimerdinger, of Newcomer's Drug Store, Toledo, Ohio, "we should say, Service, and things that taste better than people usually get."

"Newcomer's" is a large and busy store in the down-town shopping center of Toledo. When the store was opened some four years ago an unusually well written, handsomely illustrated, and neatly printed booklet was issued, from which a few quotations are here made:

Thus far only the left-hand wall furniture has been described, but doubtless your eyes have strayed more than once to the very modern diamond-shaped tables, which stretch in a long row down the middle of the room. [In the photograph there seem to be eight or more of these tables.] The silver tumbler holders on their plate-glass tops and the seats which swing beneath the tables, at once disclose one of the purposes of these pieces of furniture, but closer scrutiny reveals still further uses for them. In the first place these tables are really small show-cases, and display to good advantage many of the more ornamental sorts of packages which come from the modern drug house. The sugar-bowls indicate that more things are served on these stands than come from a soda-water fountain. Here, then, is one of the more notable ways in which this modern drug store differs from the old-fashioned drug shop, for appetizing luncheons may be had at all hours. These viands are served upon the up-to-date system known as "combination lunches," by which everything from a refreshing cup of chocolate to a repast suitable for the noon-day meal, may be ordered and swiftly furnished.

The modern drug store in a shopping district must be a rest room, among many other things, and certainly Newcomer's with its artistic surroundings, its general tone of restful luxury, and the perfection of its service, admirably fills this latest requirement of the busy shopper.

Naturally such a store as Newcomer's is as much in advance in its soda-water department as it is in all other respects. A goodly sized booklet might be written on the fountain alone. You will first note that the arrangement is wholly new. The fountain and its equipment are in two parts; one being the fountain proper, which is placed on the counter line, while the wall portion is merely a splendid background which enhances the superb marble, metal and art glass effects of the fountain as a whole.

All drinks are served on the tables, so customers are not required to seat themselves at a slab of sticky marble. The dispenser finds everything needful before him as he faces the patron, and need not turn his back in serving. This makes for quickness and accuracy, and it may be safely said that no other fountain in Toledo is so convenient in every respect.

In material and fittings the fountain is a work of art. The marble is in two contrasting tones, cut and fitted with rare skill and taste. The handsome hanging lamps, with their stained glass and brilliant ornaments, are in the best style of new art, and the specially constructed woodwork about the back of the fountain is in the same excellent taste that marks the other interior furnishings.

Much may legitimately be said of this department, for it has steadily grown in importance during the last few years. It is no longer possible for a raw boy to don a white apron and serve acceptably as a dispenser of soda water. In this, as in every other calling, specialists are demanded, and for high grade city trade only an expert can be entrusted with this extremely particular work.

The fact should be remembered that in addition to its beauty, the Newcomer fountain is thoroughly sanitary. This is worth more than a passing word. Scrupulous neatness and cleanliness are imperatively demanded in work that has to do with creams and fruits. In this store only the best of fruit juices and crushed fruits are dispensed. The question of cost does not enter into the case. Only the first quality is good enough for the customers of Newcomer's.

There is a special bill of fare every day at this drug-store lunch-room printed by means of rubber stamps, which includes soups, oysters, sandwiches, salads, hot and cold pies, dumplings, short cake and other commestibles. The price, per portion, of these dishes, is 5 or 10 cents. Then there are regular combination lunches, ranging from hot coffee and wafers for 5 cents, up to a 25-cent meal. Of course there is the usual line of cold drinks and sundaes, at 5 and 10 cents a glass.

Mr. Heimerdinger, who has charge of this department of the business of M. F. Newcomer & Son, in further explanation of his manner of building up trade, gives voice to some good business-building ideas. He says: "We consider it a mistake to serve large portions, but pay particular attention to the foodstuff and syrups we use. No matter what we serve, we try to have the best. Our lunches are prepared by a woman who is an expert, and the kitchen where she works is absolutely clean and is open for inspection at any time.

"Salads are very popular, as well as seasonable short cakes, which we have the year around, and in this way we manage to have our winter trade as productive as the summer.

"We have a seating capacity of sixty-two, but could use more room every day. We demand neatness from every-one connected with the fountain. Clean linen is put out every morning, or twice daily if necessary. The girls who

serve the table wear black dresses and white aprons, and the courteous treatment they extend to the customers is a good advertisement for the store."

Beside the store mentioned, "Newcomer's" conducts two others in the down-town district of Toledo.

Baltimoreans Enjoying a Unique Fountain.

One of the latest competitors for soda water patronage in Baltimore is the firm of Lee Williamson & Co., north-east corner of Eutaw and Fayette streets, whose pharmacy has been opened about two weeks. The name of Mr. Williamson is widely known in the Monumental City, as he was one of the founders of the four stores still conducted under the name of Williamson & Watts, which have passed into the control of the Liggett syndicate. Mr. Williamson's training has been on the business side of pharmacy rather than on the professional, and when he established his new store, something exceptional was expected of him, in which expectation his numerous friends have not been disappointed.

The Williamson & Co. establishment boasts of one of the two fountains of the hollow square type to be found in Baltimore. This fountain stands almost in the middle of a store 32 by 35 feet, and the total front of its four sides is 34 feet. It is so placed and ornamented as to present a symmetrical appearance to anyone entering either one of the three street doors. At this fountain, in the words of the conjurer, concealment is impossible. There are not even the corner columns and the canopy to screen the dispenser. He is at all times in the eye of the patron, and his every manipulation may be an object of scrutiny. One of the first articles of Mr. Williamson's soda water principles is that the dispenser shall present an appearance which shall invite confidence. Everything that the dispenser needs to compound a drink is close at hand and so close to the customer that the latter cannot be misled as to the cleanliness of the apparatus and its appurtenances. Mr. Williamson planned all the details himself, and calculated to a nicety what the effect of this or that arrangement would be. He wants to take the patron of his fountain and lead him right up to it, virtually initiate him into its intricacies and dispel the atmosphere of mystery that surrounds some soda dispensers' quarters. His fountain is a sort of "heart-to-heart talk" in marble and metal, that has already shown itself to be powerfully effective, though there are other much-patronized soda places, established for years, within one block in either direction.

Mr. Williamson may claim one important advantage. His pharmacy is next door to a theatre, and to make it easy for the patrons of this play-house to get soda water, as well as to encourage the use of temperance drinks, he has had a door cut which makes it possible to enter the store direct from the lobby of the theatre.

Mr. Williamson demands first of all that everything about the fountain shall be impeccable and that the service as well as the materials shall be of the best. To insure quality he gives much personal attention to details, but he realizes that he cannot be everywhere, and that the demands made upon his time by the other departments of the business prevent constant personal supervision. Consequently, he employs assistants who can be relied upon to follow directions and whose habits of neatness afford a guaranty that there will be no letting down in the standards set. To say that he uses only the best materials is to make a superfluous observation; he could not, if he wanted to, sell inferior drinks in his location.

Mr. Williamson has succeeded in designing one of the prettiest stores and soda-water stands in Baltimore. In some respects it stands out above all others. Every person employed in it must be competent in his or her sphere. The dispenser must know his business thoroughly. Inefficiency or even mediocrity has no place in the Williamson & Co. store.

The New York "commuter" is sometimes in such a hurry to "catch the boat" that he swallows an ice cream soda in about 1 minute and 47.5 seconds elapsed time, and dashes out of the store without waiting for his change, shouting back, "I'll get it to-morrow."

"Quality not quantity," is a motto at the fountain of De Lamatu-Lawrence Drug Company, Atlanta. Another one is known as the "three P's"—"Purity, Politeness, Promptness."

Window Signs and Fountain Decorations.

W. S. Stinson, the manager of the George B. Evans drug store at 1221 Market street, Philadelphia, is positive that a considerable portion of the success that has attended the operation of his soda fountain during this, the first season for the store, has been due to a system of display advertising on his windows.

"WE QUENCH THEATRE THIRSTS" is the suggestive legend on one displayed a few days ago that seemed to impress hundreds who probably had not been in a theatre for a week, as well as those who had just left some playhouse and were on their way to catch a suburban train for home. But Mr. Stinson does not stop here, for in addition to this large sign which consists of a strip of white paper, eighteen inches high and twelve feet long, with large black letters, there are several smaller ones on each window. The latter give more specific statements as to the character of the refreshment and the names of the newest drinks.

"My idea," said Manager Stinson, "was to catch the people across the street or who rode or drove by the store either in street cars or automobiles. In most instances a purchase is made on a mere suggestion, and I wanted to make a suggestion that would reach as many persons in the neighborhood as possible. When they reach the window, the smaller signs act as additional arguments as to the advisability of dropping in and enjoying a glass of soda. It is on the same principle that a merchant hangs out his sign with a general statement of his business, only this is an inexpensive sign that may be changed frequently and is placed on the window so that it may be seen over the heads of those who are close enough to read the smaller announcements."

A feature of the decoration at this fountain is the display of laurel, conveying a cheering and timely effect during the winter season and giving a cooling and refreshing impression in the summer months. Large bunches of this evergreen are arranged in cut glass vases and set on top of the fountain. Displays of fruit are sometimes made, but the main feature is the arrangement of the laurel. It keeps for weeks if fresh water is put into the vases occasionally, and the rich green color blends harmoniously with almost any fitting of the fountain. It is always to be had at comparatively little cost.

Government Loses in the Coca-Cola Case.

Notwithstanding the many unsavory things about coca-cola and the way in which it is manufactured, testified to by government witnesses, in a case reported in the CIRCULAR for last month, page 219, Judge Sanborn, who was conducting the trial, decided that the government had failed to establish an actual violation of the letter of the food and drugs act by the coca-cola manufacturers, and dismissed the case.

In the trial it was brought out that coca-cola consists principally of caffeine made from tea, in flavored syrup. The proportion of caffeine was stated to be a fraction over one grain in each fluid ounce (about 0.22 grammes of the alkaloid in 100 grammes of the syrup).

One of the most interesting features of the trial was the large array of expert witnesses on each side. The case fell through, seemingly, because of a confusion in the minds of some of the prosecuting witnesses between what the law actually prohibited and what they thought it ought to prohibit.

Chocolate Syrup.

By making his chocolate syrup according to the formula herewith presented, John F. Huchting, Branchville, S. C., secures a smooth product which he finds satisfactory:

Powdered cocoa.....	4 ounces.
Sugar	8 ounces.
Milk	8 ounces.
Glycerin	2 ounces.
Tincture of vanilla.....	4 drams.
Water enough to make.....	2 pints.

Mix the chocolate and sugar and reduce them to a fine powder. Add water and boil until the syrup thickens. Remove from the heat; when it is cool add the glycerin, milk and tincture of vanilla, and beat well with an egg beater.

In boiling chocolate great care should be used to see that it does not burn. A steam jacketed kettle or a sand-bath is a very useful appliance for use in the syrup-manufacturing department.

Some Old Time Advertisements.

In the fourth issue of the CIRCULAR (that is, in the issue for April, 1857), on page 40, appear the first two soda-water advertisements ever printed in this medium. One of them occupies a space of four lines, single column, and reads.

SODA SYRUPS—Made very heavy—from fruit—expressly for soda. For sale in packages of not less than five gallons, by F. B. Nichols, 71 Pine st.

There was less than 2½ pages of advertising in that issue, all told, the largest single advertisement being 6 inches, single column.

In that issue H. Planten announced that he had associated with himself his son, John R. Planten, and that the manufacture of gelatin capsules would be continued as before at 224 William street—an address, by the way, from which the firm has but lately moved.

Hegeman, Clark & Co. had a cod liver oil advertisement. They gave four addresses on Broadway, 165, 273, 511, and 756.

Eimer & Amend's card occupied five lines. Their address was the same then as now.

B. B. & J. Hagerty, 8 Platt street, and J. Neidlinger, 191 Pearl street, announced that they had on hand or would make to order glassware of every description.

Most of the other advertisements in that issue are of small interest or significance to present-day readers, but here is another one of Mr. Nichols' which is entitled to reproduction in full:

NICHOLS' S IMPROVED PATENT COMBINATION SODA WATER APPARATUS,

Unrivalled for cheapness, safety, portability, simplicity, ease of operation, strength and purity of water produced,

ALSO
Fancy Counter Stands. Some new and beautiful designs.

F. B. NICHOLS agent,

71 Pine street.

In the CIRCULAR for April of this year, there are more pages of advertisements of soda fountains and accessories than there were pages in the entire number for April, 1857.

A Wide-Awake Missouri Dispenser.

"First, we believe in quality. We serve only the best of everything. When we get a good line of syrups and crushed fruits, we stay with it.

"Second, we maintain absolutely sanitary conditions about our fountain.

"Third, we require all our attendants to be courteous at all times. We encourage them to learn to know the customers and what they like, as there is delicate and subtle flattery in recognizing people and remembering their tastes."

In these three declarations does W. L. Kindel, chief dispenser at the fountain of the Wherrett Drug and Manufacturing Company, Kansas City, Mo., lay down his platform. And it is a good one, too, and comes pretty close to filling the bill. It is not only good on paper, but has proven good in practice, for the Wherrett Company does an enviable soda business.

To the CIRCULAR Mr. Kindel says: "Our trade is regular; we see comparatively few new faces from day to day; and our sales vary but little.

"We maintain a uniform standard for our syrups, fruits, ice creams and ices, and consider this very important.

"Our carbonated water is kept very cold, well-charged and sparkling; the colder the water the more gas it will absorb and the more snappy it will be.

"We serve soda in polished glasses only.

"We never mix new syrup with that already in the fountain. As soon as a tank is empty, it is washed in hot water. After that, fresh syrup may safely be put into it.

"We let no part of the fountain go untouched for a single day—every morning a general cleaning takes place.

"We employ competent dispensers who serve customers instantly; who know how to serve properly; who know

where everything is kept. Delay or poor service makes a bad impression. We try to avoid changing help; our fountain has been under its present management for years.

"We measure everything carefully. Our experience is that guess-work and uniformity of product are incompatible.

"We get good prices for all our drinks; for ice-cream soda, 10 cents.

"We make our own simple syrup once a week, using a 30-gallon percolator. Into this we put 100 pounds of granulated cane sugar, which we cover with 6½ gallons of filtered water. In the morning the water has run through. The percolator is kept sweet and clean with hot water, as even simple syrup will spoil if made in sour vessels.

"We display no signs, but talk to customers about our goods and service, and let them do our advertising by talking to their friends.

"We hold our dispensers responsible for the proper use of the materials placed at their disposal. They are supposed to follow directions and see that the public is served in as clean, neat and pleasant a manner as possible. If they do their best, success is assured. The public appreciates quality and service, and manifests their appreciation by creating increased business, resulting in increased profit for the proprietor and increased salary for the dispensers. All our dispensers are men."

Every day sees a special drink or sundae at the Wherrett fountain. A few of the formulas in use follow:

Zenap.

Draw into a straight mineral-water glass, 1 ounce of orangeade syrup; add ½ a fresh lime, with peel; shave ice in the glass; and fill with ginger ale. Top with sliced orange and a cherry. Serve with straws, and collect 15 cents.

Golden Sunset.

Into a lemonade glass draw 2 ounces of orangeade syrup; shave ice into the glass; fill three-fourths full with carbonated water; and add two orange slices. Top with a disher of ice cream and a cherry. Serve with a spoon and straws. Price, a dime-and-a-half.

Nana-Berry Sundae.

On an oblong dish place a split banana; add a disher of chocolate ice cream and a disher of vanilla ice cream, with a whole cherry on each; and a ladle of fresh strawberries. Lay on each side a dainty wafer, and sprinkle over the whole some ground pistachio nuts. When five of them are ordered and a dollar bill laid down, there is no change coming.

The menu in use at this fountain shows 21 ice cream sodas, at a uniform price of 10 cents; 24 sundaes at 10 or 15 cents; 12 lemonades ranging from 10 to 20 cents; 16 egg drinks, mostly 15 cents, but egg phosphate is 10 cents, and egg malted milk with ice cream, 20 cents; 10 mixed drinks at 10 or 15 cents; 21 phosphates and thirst quenchers, at 5 or 10 cents; 14 mineral waters at 5 to 25 cents; and a blank space for 3 "specials to-day."

Most people are embarrassed by close watching when they are eating or drinking.

Agree with your customer before he leaves the store, as you may never have another chance.

Soda water well served to a chance dropper in May, and often does, mean the gain of a steady customer for soda and drugs.

Tired- and discouraged-looking spoons, glass holders, etc., are as little attractive to the public as our sleepy-eyed, unshaven, unmanicured and otherwise untidy dispensers.

Economizing on the price of eggs and then breaking an "over-ripe" one in the presence of a customer, is a good example of saving at the spigot and losing at the bung.

Crackers that have the appearance of having been handled by a previous customer are not relished by the dainty. Broken crackers or crumbs in the plate give that appearance.

Eating ice cream leaves some people thirsty for plain water. This is a hint. Everything else being equal, the soda man who acts on it—or who does not need it—will succeed where one of another kind will fail.

Cranks may be unreasonable, but the customer who prefers to patronize a clean fountain is not necessarily a crank and is certainly not unreasonable. The dispenser who thinks otherwise is in the wrong business.

Ice Cream as a Side Line.

H. A. Nolte, proprietor of drug stores at Atlantic City and Philadelphia, who with his brother, H. R. Nolte, recently opened a store at Wayne and Logan streets, Germantown, one of the fashionable suburbs of the latter city, has unexpectedly developed a well-paying ice cream business in connection with his soda fountain. When the store opened a short time ago, the sale of ice cream became a feature at the fountain, and many requests were made for the frozen confection by the pint and quart. It became necessary for the proprietors steadily to increase their or-

Snappy Soda

The thirstiness of the first warm weather doubtless reminds you of many pleasant moments spent at our fountain last summer.

We are ready for the business of this season with the tastiest and classiest drinks possible to produce. Rich, real-fruit flavors, thoroughly carbonated water, perfectly sterilized. Perfect hygienic conditions, together with expert dispensers, make our soda the sort that will please any palate and relieve any thirst.

All the old-time fruit drinks, as well as all the newest fancy drinks, plain sodas, phosphates, ice cream combinations and fancy lemonades.

(Name and address)

ders for ice cream, and as they had plenty of room in the cabinets of their iceless fountain, they announced their readiness to sell and deliver ice cream.

There is little competition in the neighborhood and further plans are being considered for the selling of the cooling delicacy in any quantities to families.

Americans Like Chocolate.

Imports of tea and cocoa for the fiscal year ending June 30th next, according to the bureau of statistics of the department of commerce and labor, bid fair to be the largest in the history of America's import trade.

Coffee, which is showing the highest prices since 1897, has fallen in the imports. Since last July 644,000,000 pounds have been imported, or 100,000,000 pounds less than during the corresponding period last year. Meanwhile tea and cocoa are surpassing all records.

At the present rate of importation it is probable that tea imports into the United States will aggregate 115,000,000 pounds, and that cocoa will exceed 140,000,000 pounds.

Some people do not like to place to their lips the rim of a glass on which they have seen the grimy hands—or any other kind of hands—of another person. It is well for soda dispensers to act as if every customer were as finical as the most finikin.

The Soda Clerk.*

I wisht I had to drive a truck,
Or guide a buzzin' taxicab;
On this here job I am not stuck,
An' that's no plain carbonic gab.
Say! see the signs behind me back?
Well, all them drinks I've got to mix;
Of half of 'em I can't keep track—
This soda game is full of tricks.

When I went in the soda biz
A kid could hold his end up then;
You blew the glass chock full of fizz,
An' let it go at that. But when
They run the ice cream in on us,
I see right there the time had come
When soda jerkin' was a muss
An' not a clean an' genteel game.

From ice cream they jumps into fruits,
An' then some guy puts sundaes out;
If they keep on, you bet your boots,
We'll soon be servin' frozen kraut;
With eggs an' hay an' canteloupes,
Bananas, berries, grapes an' limes.
They've surely got us rollin' hoops
About four jumps behind the times.

Envoi.

A chemist you have got to be
To get a soda clerk's degree;
What used to be plain soda brew
Is now a sweetened Irish stew.

Homogenized Cream.

Good Dr. Wiley, of Washington, always on the lookout for anything that may harm the tum-tums of the people, has discovered a so-called homogenized cream, made by mixing butter and skimmed milk by means of a homogenizer, a mechanical contrivance for breaking up the fat and so mixing it with the milk that it will not separate upon standing.

"Ice-cream" made from such milk, says Dr. Wiley, is not entitled to the name.

In passing it may be said that it seems strange that one should find it economical to skim the cream from milk, churn and make butter of it, and then go to the trouble to put that butter back into the skim milk, and use the product in place of the whole milk he had in the first place, but there is on the market an apparatus for undoing the work of the churn.

A Bunch of Garnered Formulas.

Seltzer Lemonade.

Juice of 1 lemon, 1 tablespoonful of powdered sugar, $\frac{1}{4}$ glass of cracked ice. Stir with a spoon and fill with seltzer water. Stir again, strain and serve with straws.

King's Favorite.

Pineapple syrup, $\frac{1}{2}$ ounce; raspberry syrup, $\frac{1}{2}$ ounce; vanilla syrup, $\frac{1}{2}$ ounce; egg, 1; milk, 4 ounces; a little ice. Shake, fill with carbonated water and strain.

Royal Muscadine.

Into a 12-ounce glass draw $1\frac{1}{2}$ ounces of raspberry syrup; add 1 ounce of grape juice and 3 dashes of raspberry vinegar; fill $\frac{1}{2}$ full of ice and balance with carbonated water; mix and decorate.

Springtime Dream.

Into a 12-ounce glass draw 1 ounce of raspberry syrup and $\frac{1}{2}$ ounce of orange syrup; add the juice of $\frac{1}{2}$ a lemon and $\frac{1}{2}$ ounce of grape juice; fill $\frac{1}{2}$ full of ice and balance with carbonated water; mix and decorate.

Waltz Dream.

Into a 12-ounce glass draw 1 ounce of raspberry syrup, $\frac{1}{2}$ ounce of orange syrup, 2 ounces of sweet cream and a portion of ice cream, and shake thoroughly. Fill with carbonated water and strain into another glass and top with whipped cream.

Chocolate Peach Sundae.

On a fancy plate place a disher of chocolate ice cream. On each of two sides of the cream put a thin wafer and on

*"Selected" by the New Idea.

the opposite sides put half of a peach previously sliced. Over the slices of peach put a spoonful of whipped cream and pour over all a generous quantity of chocolate syrup.

Multi's Delight.

Prepare cream for freezing, 1 gallon. Add $\frac{3}{4}$ ounce powdered chocolate, put in the freezer and turn until the mixture comes near the freezing point. Remove the lid and add 1 pound of chopped nuts. Finish freezing, take out the dasher and work in with a butter paddle six sliced bananas (being careful not to mash). This makes a very rich sundae and should bring 15 cents.

Honey Dew Syrup.

Maple flavor, 1 ounce; honey, 1 gallon; raspberry juice, 1 quart.

Pistachio-Banana Sundae.

On a split banana place two small portions of pistachio ice cream. Then arrange in an oval around the plate the segments of a small peeled navel orange. Add a few pistachio nuts.

Madame Sherry.

Place upon a split banana on an oblong plate two small portions of vanilla ice cream. Put candied cherries around the edge of the banana about an inch apart. Between the mounds place a spoonful of chopped nut meats.

Milk Chocolate Shake.

Chocolate syrup, $1\frac{1}{2}$ ounces; rich milk, 5 ounces. Shake well, and shave some ice on top. Fill the glass with shaved ice. Stir with the fine stream.

Vanilla Milk Shake.

Fill a glass half full of rich milk. To this add 2 or 3 spoonfuls of sugar. Shake in a few drops of extract of vanilla. Fill the glass nearly full of finely broken ice. Shake vigorously, and fill the glass with the fine stream. Serve with a spoon and straws.

Nut Salad Sundae.

Chop 1 pound of mixed nuts and add 10 ounces of crushed strawberry and 10 ounces of crushed pineapple. Pour over plain ice cream.

It is sloppy to overrun a glass when drawing soda, and sloppiness does not attract trade; indeed it has been known to drive away some of the best customers.

Sample of soda card marking done by Harry Lee, proprietor of a rapidly growing soda business in the Baltzly Drug Store, Broadway and Ninety-sixth street, New York. The original card is about 15 by 20 inches; the large letters are red, the small ones black, and the borders are combinations of green, black and red.

Meetings of American Pharmaceutical Association Branches.

Chicago.—In spite of rainy weather, the Chicago branch of the American Pharmaceutical Association held a very well-attended and enjoyable meeting April 18th. The evening was devoted to a discussion of the subject of photography.

Prof. A. H. Clark was the speaker of the evening, his subject being "The Chemistry of Photography." A brief review of the history and development of photographic methods was given particularly with regard to the modern dry plate. The effect of light upon the salts of silver was discussed briefly, and the theory of the developing and fixing of a dry plate was explained. Experiments were used to illustrate the character of the chemical changes that take place in the various printing processes, and the difference in the various kinds of papers was explained.

Prof. N. G. Bartlett followed with a very interesting talk along the same lines. In reply to questions from the floor he outlined the method of making films for motion-pictures.

O. U. Sisson read a timely paper setting forth the commercial aspects of photography and the opportunities for the pharmacist who deals in photographic supplies and appliances as a side line.

A lively discussion followed and at its conclusion the branch formally thanked the speakers.

The next meeting will be held May 16th.

New York.—Once again the New York branch of the American Pharmaceutical Association found one evening far too short to admit all the papers contributed, and several of those to be offered at the meeting held April 10th were carried over until the May meeting. In the matter of attendance there was also a crowd.

As a part of the routine of the meeting Treasurer Joseph Weinstein reported a balance on hand of \$55.39. W. F. MacDowell, chairman of the committee on membership, and J. L. Lascoff, associate, told of the missionary work they were doing and of having secured several new members. Chairman T. D. McElhenie, of the committee on professional relations reported that he had invited a number of physicians to attend the meetings.

For the committee on the progress of pharmacy Otto Raubenheimer read in abstract the following articles: "The Non-Toxicity of Pure Methyl Alcohol," by Arends (*Pharm. Zeit.* 55, 1910); "The Yellow Color of Picric Acid," by Stepannow (*Lieb. Ann. de Chem.*); "Detection of Artificial Colors in Foods," by Spaeth (*Pharm. Zentralh.*); "Preparation of Salvarsan" (*Jahres. prakt. Pharm.*); "Results with Salvarsan," by Ehrlich (*Wien. Med. Woch.*); "Nitrite Poisoning from Bismuth Subnitrate" (*Berl. klin. Woch.*); "History of Glauber, Epsom, and Rochelle Salts" (*Pharm. Journ.*); and "Analysis of Lavona de Composé" (*Pharm. Zeit.*) He also called attention to several new books.

With Vice-President Diekman in the chair Mr. Hitchcock reported for the committee on joint meetings with physicians. He said that the annual meeting with the Medical Society of the County of New York would probably be held within a month.

The first speaker of the evening was Jacob Diner, whose subject was "Bacteriological Aids to Diagnosis." He pointed out how the physician was coming to rely more and more on the bacteriologist because his assistance makes diagnosis more rapid and certain. The role of bacteriologist, he said, was particularly fitting to the pharmacist and could be taken up with the expenditure of a little money, some more time and a great deal of study and practice. Aside from the apparatus that should be in every pharmacy little equipment was necessary: Petri dishes, culture flasks, and platinum needles and loops constitute these.

Mr. Diner then told how the bacteria could be propagated and identified, impressing upon his hearers the need for cleanliness in all operations.

Messrs. Weinstein, Diekman, Niece, Raubenheimer, and Eccles spoke on the possibilities of bacteriological work. Dr. Eccles said that the pharmacist had not been keen to take up this work, but he thought it would be necessary for the pharmacist to be a bacteriologist. Dr. Eccles spoke very interestingly of the tendency away from drug therapy, telling of the progress toward safe vaccines and anti-toxins and studies in anaphylaxis.

The second paper was one on "Making Blood Counts and Bacterial Vaccines," by Paul Caldwell. This paper was read by Secretary Hugh Craig. Mr. Caldwell showed

that the counting of blood cells was a simple task and that the conditions governing the preparation of auto-genous vaccines were not restrictive to the pharmacist. He declared that it was not necessary to isolate specific bacteria in making vaccines as only one species would have any effect. Mr. Caldwell told of one case of **appendicitis** in which vaccine prepared from another patient had been successfully employed.

Messrs. Niece, Weinstein, Diner, and Gallagher added to the discussion of this subject.

Joseph Weinstein, whose subject was "Uranalysis," declared that the pharmacists must take up as new "side lines," work that is germane to pharmacy and not possible to department stores. The analyzing of urine was prominent among lines of this sort, he said, and there was no reason for the pharmacist to hesitate about undertaking it. To support his statement that the pharmacist with very little expense of time or money could profitably engage in uranalysis, the speaker described briefly the recent methods of detecting albumin; the use of blood and pus tests, interpretation of diazo reactions; tests for indican, bile-pigments, and glucose. He laid particular stress on the necessity of preventing deterioration of the sample to be examined, and of taking into consideration all influencing conditions.

Messrs. Lascoff, Eccles, Niece, Raubenheimer, Diner, Gallagher, and Goeckel discussed this subject. The prevailing opinion was to the effect that uranalysis was a profitable pursuit for the careful, trained pharmacist. Some difference of opinion arose as to whether a pharmacist should analyze a patient's urine without the knowledge of the attending physician; the disturbing element, the unworthy individual, was recognized as the determining factor in this contingency.

Because of the lateness of the hour J. L. Mayer, who was to speak on "Water Analysis," gave but a synoptic description of a scheme of water examination, bacteriological and chemical. He stated that the pharmacist was logically the person to do this work and was also by training fitted for it. Dr. Mayer will treat his subject more at length at the May meeting.

F. E. Niece presented an outline of the work connected with the examination of milk. At the May meeting he will speak of the subject of "Milk Analysis for the Pharmacist."

As it was by that time midnight a talk on "The Detection of Food Adulteration," by Hugh Craig, was deferred entirely until the next meeting, which will be held May 8th. And, after expressing its thanks to the speakers, the branch adjourned.

Northern Ohio.—Practically the entire meeting of the Northern Ohio branch of the American Pharmaceutical Association, held March 24th, at Cleveland, was devoted to the reading of a paper on "Modern Pharmaceutical Manufacturing," by J. F. Woolsey, and the subsequent discussion.

Mr. Woolsey prefaced his paper with the statement that despite the pessimists, the scientific aspect of pharmacy was still of paramount importance, and that none recognized this more clearly than the successful manufacturing pharmacist. He declared that there was no line of trade more dependent upon the chemist for solution of problems than manufacturing pharmacy, and he stated that the laboratory chemist and the prescriptionist are the two exemplifiers of scientific pharmaceutical endeavor.

In Mr. Woolsey's opinion the federal food and drugs act has been a valuable stimulus to pharmaceutical advancement, and at the present time manufacturers are desirous not only of reaching pharmacopoeial standards but of surpassing them. These advances in standards, he said, benefited the manufacturer through increased sales for his product because modern retail pharmacists demand the best that the market affords. He believed that the average quality of pharmaceuticals was now much higher than it was ten years ago.

The speaker then took up the description of various manufacturing processes. He stated that because of improved apparatus the quality of extracts and fluidextracts had been bettered. The manufacture of elixirs, he said, had not advanced much, but in the making of tablets and particularly of pills there had been marked strides toward perfection. Mr. Woolsey told of the aseptic conditions surrounding the manufacture of hypodermic tablets; and of the methods of making elastic capsules. Up-to-date methods of comminuting drugs were described by the speaker. In

conclusion he outlined the usual system of marketing employed by manufacturers.

In the subsequent discussion the manufacture of empty capsules and "bipalatinoids" was discussed.

At the suggestion of Secretary H. V. Arny the branch started a subscription to the Hallberg memorial fund.

Washington.—The meeting of the City of Washington Branch of the American Pharmaceutical Association held on the evening of April 8th, was devoted to a general discussion on matters of interest to pharmacists. The following papers were read: "The Use and Advantage of a Restricted Materia Medica," by Dr. M. G. Motter; and "Magma of Magnesia: a New Formula and a Modified Process," by S. L. Hilton. There was also an exhibition of specimens of some of the preparations of the new German Pharmacopoeia and the National Formulary, by Otto Raubenheimer, of Brooklyn, N. Y., and J. K. Thum, of Philadelphia, respectively.

Dr. Motter called attention to the efforts that have been and are being made in this country to bring about reforms in therapeutic practices, and pointed out that in this connection the need for limiting instruction in materia medica subjects to a restricted list of substances is being recognized by teachers in medical schools. He asserted that it has been impractical if not impossible to give students of medicine that thorough grounding in the essential features of the U. S. P. which the importance of the subject would appear to demand largely because teachers are obliged to devote too much time to the discussion of unimportant drugs in order to fit their students for the State board examinations. Dr. Motter then reviewed, at some length, the efforts that have been made to bring about reforms in this connection, and exhibited a restricted list adopted by the teachers and examiners of the University of London as a basis for examining candidates for degrees as well as licensure.

Dr. Motter expressed the belief that unless the scope of our recognized national standards could be restricted to a reasonable number of articles, the books themselves must be ignored entirely by medical schools. He characterized the present United States Pharmacopoeia as an illustration of "would-be science," the National Formulary as "a hybrid between science and commercialism," and New and Non-Official Remedies as "a sop to the commercial Cerberus."

As an illustration of the tendency manifest, he read the preamble and resolution adopted at the annual meeting of the Association of American Medical Colleges, held at Chicago in February, in which teachers of materia medica and State medical examining boards were urged to adopt the limited materia medica lists published by the joint committee of the council on medical education of the American Medical Association, and of the National Confederation of State Medical Examining and Licensing Boards, and the Chicago Medical Society.

The subject was further discussed by Messrs. Kalusowski, Flemer, Hilton, Hunt, and Wilbert, and the general trend of much of the discussion suggested the desirability of having the U. S. P. restricted to important medicaments so that it might serve as the basis for materia medica instruction in medical schools. Dr. Hunt and Mr. Wilbert were of the opinion that the physicians' part in the revision of the Pharmacopoeia is but a minor one, and that much of what the better informed medical men might have to say is discounted by the "fictitious value that is accorded to the reputed needs of the less conscientious, or less competent practitioner who is willing to continue the use of substances that appear to have no recognized medicinal value."

S. L. Hilton reported a series of experiments to determine the most desirable process for making magma of magnesia N. F. He exhibited a number of samples and presented a formula in which the amount of magnesium sulphate is increased to 330 grammes, and the amount of sodium hydroxide to 119 grammes. The resulting preparation, while much more limpid than the magma usually met with, contains more magnesium hydroxide and is therefore more efficient.

Secretary Wilbert exhibited a number of preparations, made by Otto Raubenheimer, illustrating some of the additions and changes embodied in the D. A. V. He also showed a number of samples of solution of peptonate of iron with manganese made by J. K. Thum, according to a formula proposed for the N. F., showing the possible variations resulting from slight modifications of the method of

procedure. Mr. Thum ventured the opinion that the formula and method proposed by Dunning, in 1905, give much more satisfactory results.

Mr. Hilton, as secretary of the District of Columbia Board of Pharmacy, called attention to the objections that have been made to a recent ruling of the board that the dental supply depots could not legally sell narcotic drugs. The subject was discussed considerably, and the branch endorsed the efforts of the board.

Papers Wanted for the Boston Meeting of the A. Ph. A.

In an endeavor to surpass the showing made at the 1910 meeting of the American Pharmaceutical Association by the section on practical pharmacy and dispensing Louis Saalbach, chairman of the section, asks members to contribute for the 1911 session papers on operative pharmacy, notes on official preparations and ideas pertaining to the every-day practice of pharmacy generally. Papers should be sent to the chairman whose address is 1436 Fifth avenue, Pittsburg, Pa.

Prof. Charles W. Johnson, University of Washington, Seattle, Wash., desires to receive contributions of papers to be read at the Boston meeting in August, of the association, before the section on pharmaceutical education and legislation, of which he is chairman. He would be glad to correspond with any member of the association who is in a position to send a paper for presentation before this section.

Solution of Hydrogen Dioxide Not a Drug in This State.

By unanimous decision handed down April 7th, the appellate division of the supreme court of this State upheld the fifth district municipal court of this city in the case of the New York Board of Pharmacy against F. W. Woolworth & Co., involving the status under the pharmacy law of solution of hydrogen dioxide when sold in original ready-to-market containers. The lower court had ruled that the sale of the solution did not affect the public welfare in such a way as to require the supervision of a licensed pharmacist. (See the CIRCULAR for August, 1910, page 442.)

The appellate division ordered the board to pay the costs amounting to \$79.80. It is stated that the board will carry the case to the court of appeals.

Druggist Not Liable for Error of Employee.

A verdict of acquittal was returned by a jury in the court of general session in this city in the case of a local druggist charged with having made an error in dispensing a prescription, which resulted in the death of the patient. The allegation was that corrosive mercuric chloride was dispensed in mistake for mercury with chalk.

The druggist's defense was that the prescription had been compounded by a clerk who had since left his employ. Although the druggist himself handed out the medicine to a nurse, the court so interpreted the meaning of the word "dispense" in section 1742 of the penal code, as to lead the jury to exempt him from criminal responsibility.

New York "Medical Institutes" Raided.

Postoffice inspectors and the local police raided three mail-order medical-advice concerns in this city, April 20th. The concerns visited were the Hartmann Medicine Company, the Vienna Medical Institute, and the Universal Medical Institute. Five prisoners and several dozen bags of mail matter were seized.

For the most part the "institutes" operated among the foreign-speaking population. All of them played the old game of selling weak preparations of ordinary drugs to diagnosis-blank "patients" for large fees.

William H. Rogers, of Middletown, N. Y., a former president of the New York State Pharmaceutical Association, recounted in his well-known happy style some of his experiences among the Mexican insurgents, in an article recently appearing in the Middletown *Daily Argus*.

The Bettles Pharmacy, C. C. Bettles, proprietor, of Jacksonville, Fla., has been incorporated with a capital stock of \$125,000.

Westchester County Association.

In calling to order the Westchester County (N. Y.) Pharmaceutical Association at a meeting held April 12th, at Ossining, President John Roemer, of White Plains, recounted the work accomplished by the association in legislative and commercial matters, and called upon the members to support the propaganda for the knowable in medicine. He believed the spirit of commercialism in pharmacy to be waning, and that pharmacists would begin to rely upon their technical training for their success.

After the minutes of the previous meeting had been read and approved, and a facetious disposition had been made of a proposition that the officers have their photographs taken for publication, the chairman of the executive committee, L. J. Schlesinger, of Yonkers, presented applications from two prospective members. Later these two druggists were duly elected to membership.

Relative to the matter of commissions on telephone messages F. A. Russell, of Tarrytown, told of having communicated with other organizations and also officials of the telephone company, and expressed the belief that the endeavors of the association would be resultful.

An appropriation of \$10 was made for the use of the entertainment committee of the New York State Pharmaceutical Association. The sum of \$13 was collected for the Hallberg memorial fund.

As delegates to the meeting of the State association Messrs. Russell, Schlesinger, McCullough, Roemer, and Alvord were chosen.

Propaganda matters coming up for consideration, Dr. William Muir, of Brooklyn, related at the invitation of the chairman, the results obtained in his city by the distribution among the physicians of post cards calling attention to the composition, dose, and uses of official preparations. The Westchester association had been using propaganda literature furnished by the National Association of Retail Druggists, but the plan referred to by Dr. Muir so appealed to his hearers that the matter of using the N. A. R. D. literature was reconsidered, and the propaganda committee was advised to formulate a plan for making use of especially prepared post cards to be sent out by the members.

The chairman named Messrs. Farrington, Smith, and Alvord as the propaganda committee for the ensuing year.

Mr. Roemer, to illustrate the feeling of the makers of nostrums toward the retail druggists, read several letters he had received from several well-known concerns. He had written to fifteen to ascertain whether they made any attempt to protect the retail prices of their wares, and whether they considered the druggist to be the proper retailer of their products. But six had replied. Their answers, Mr. Roemer said, indicated that they had no care as to what happened to the druggist.

The first formal speaker of the day was Dr. Henry T. Kelly, of White Plains, who spoke on the subject "Is Pharmacy a Lost Art"? The Doctor was of the opinion that the external appearance of drug stores pointed to the affirmative answer to this question. But he had a strong hope that, despite the lack of business training among physicians and the tendency toward commercialism among pharmacists, the haven of the few thinkers in both professions would bring the two bodies into co-operation. He set forth plainly and emphatically that he considered the pharmacist dilatory and false to his trust who permitted a desire for bigger profits to influence him to select an inferior grade of drugs.

Purity of drugs the speaker averred to be one of the essentials in medicine, and he said that the pharmacist to fulfill his part in the group of physician, pharmacist and patient must of his own knowledge be sure of the quality of the drugs he dispenses. Cheapness he believed to be at the bottom of most of the ills of the body pharmaceutical and he called upon pharmacists to inaugurate a "revision upward" of drug store standards and of the druggist's conception of his duty.

Mr. Roemer believed that in a trend toward better, higher pharmacy lay the solution of the chain-store problem.

Dr. Muir said that carelessness and indifference of both pharmacist and physician were responsible for many of the evils laid at pharmacy's door. Rigid inspection was necessary, he said, and the punishment of willful violators should be severe. It was his belief that the number of voluntary infractions of the law was small and that druggists and doctors were getting together in a way that would eliminate the underserving.

Messrs. Russell, Alvord, and Schlesinger also discussed Dr. Kelly's paper, agreeing with him as to the desirability of better things, but pointing out the difficulties that handicapped the druggists in ascertaining the quality of some of their drugs.

Hugh Craig, of THE DRUGGISTS CIRCULAR, was the other speaker of the day, his subject being "The Possibilities of Professional Side Lines." To point out the benefits that lie in bacteriological and analytical work was the speaker's endeavor. He told the druggists that they could gain the confidence of the physicians, uplift themselves in the estimation of their fellow-townsmen, and make a good profit; by preparing themselves to aid the physician in laboratory diagnosis and to undertake the chemical work that is at hand in every community.

Mr. Craig urged his hearers to consider the advisability of spending the time required to sell soda water and knick-knacks in equipping themselves with a better working knowledge of bacteriological work, uranalysis, the analysis of water, milk, and foodstuffs generally, and of the role of chemical assistant to the modern farmers of their vicinity. The speaker also described briefly some of the methods of analysis to which he referred. And in conclusion he advised the druggists to cultivate that which alone could be relied upon to assist them toward success: their individual ability.

Midway in the meeting adjournment was taken for the purpose of discussing a goodly array of comestibles.

The association will next meet at Rye Beach in July, at which time each member is expected to bring with him his physician friends.

New York German Apothecaries.

Because of the interesting nature of the program an unusually large attendance marked the meeting of the New York German Apothecaries' Society held April 6th. As an indication that the society's years have not interfered with its growth there were applications of seven apothecaries desiring to become members handed in.

After the various communications on the secretary's desk had been disposed of the reports of the committee were taken up, that of the entertainment committee being the first. O. P. Gilbert, the chairman of this committee, said that the plans for the jubilee celebration in October were nearing completion, and that the aspect daily grew more gratifying. He then reported that arrangements had been completed for a visit by the society to the manufacturing laboratories of Sharp & Dohme, at Baltimore. This call will take place May 17th and 18th, the visitors leaving on a Pennsylvania special train at 1:30 o'clock, on the afternoon of the 17th. While at Baltimore they will be entertained with a theater party, an automobile tour of the city, and a dinner at the Country Club. Full details may be got from Mr. Gilbert, whose address is 453 Ralph avenue, Brooklyn.

S. V. B. Swan, chairman of the legislative committee, presented a detailed report on the various matters of a pharmacal-legal nature of moment at the time. He mentioned that the New York State Board of Health had appointed a former druggist as an inspector who was visiting manufacturers and wholesalers, and obtaining the addresses of retailers who had bought narcotics, and also the amounts purchased. He said that it had been established that one wholesaler in a single month had sold 6000 ounces of cocaine.

An emphatic denial of a rumor that pharmacal supervision was not as it should be was made by Otto Raubenheimer and Dr. G. C. Diekman, the latter declaring that the inspectors of the board of pharmacy were very diligent in their duty. A motion to extend a vote of confidence to the board was unanimously carried. Dr. Diekman as president of the board thanked the society for this proof of confidence, as well as for the support which the board had always received from the society.

M. Brandt, justifying himself against an attack which had been made against him during the "World's" campaign (see last month's CIRCULAR, page 226), showed that his interpretation of the prescription in question was a logical one.

An appropriation of \$50 was made to the Hallberg memorial fund.

The lecturer of the evening was Dr. E. W. Dittrich, who gave his hearers a great deal of interesting information upon the timely subject of "Salvarsan." Phases of the new theory of medical treatment of which salvarsan is

the best known medicament were presented by Dr. Felix von Oefele and Dr. Friedrich Klein.

After the speakers had been formally thanked, the meeting was adjourned.

Kings County Society.

With a gratifyingly large number of members present the Kings County (N. Y.) Pharmaceutical Society held a regular meeting at Brooklyn, April 11th. Two persons were elected to membership, and applications were received from seven desiring to join.

Treasurer Adrian Paradis reported a balance of \$401.63 in the treasury of the society, and college funds on hand to the amount of \$13,145.02.

Some informal reference to legislative and trade matters was made, Dr. William Muir distributing a number of large cards on which were printed the laws and ordinances applying to the every-day business of the druggist. These cards had been prepared for free distribution to all pharmacists of the county. Otto Raubenheimer told of a new ruling by the municipal bureau of combustibles requiring wholesale dealers to report all sales of five gallons or more of the light petroleum distillates.

For the committee on trade matters Charles Heimerzheim reported that 200 copies of the Physician's Manual of the U. S. P. and N. F. had been supplied to students at the Long Island Medical College; and that the fourth of the series of propaganda post cards were ready to be sent by members to their physicians. Messrs. Heimerzheim, Muir and Rehffuss told of the good results attending the use of these cards.

The sum of \$50 was donated to the local committee of the New York State Pharmaceutical Association to be added to the entertainment fund. It was decided that the society would pay the carfare of its delegates to the meetings of the New York and New Jersey associations.

Mr. Raubenheimer, as chairman of the committee on pharmacy, introduced the speaker of the occasion, Prof. Joseph Kahn, whose subject was "The Chemistry of Some Important Synthetics."

Prof. Kahn's address dealt with the relation of the chemical structure of anesthetics, hypnotics and analgesics to their physiological effects. By graphic formulas and simple direct explanation he pointed out to his hearers how out of methane were evolved the simple chlorine compounds employed as anesthetics, how the more complex ethers grew from the first group of compounds, and how in the higher compounds the aldehyde and the sulphon groups were introduced with a purpose clear to the synthetic chemist. The speaker pointed out the peculiarities, physical and physiological, of the various groups entering into the simple and complex synthetics, and related how the synthesists had labored to adjust the compounds of simple synthetics or alkaloids with groups of known influence so as to produce a balanced medicament.

Prof. Kahn performed a number of chemical experiments to illustrate his discourse. At the conclusion of his address he received the formal thanks of the society.

P. C. P. Has Some Ball-Players.

Down in Philadelphia they are saying that N. Y. C. P. stands for "Naw; you can't play," because the Philadelphia College of Pharmacy baseball team again defeated the representatives of the College of Pharmacy of the City of New York, Columbia University, in the second annual inter-city game, played at this city, April 14th. Only six innings were played because the principal feature of the occasion was a driving rain; in fact so much in evidence was the rain that a lay spectator was led to remark that like all things turned out by druggists the game was mostly water.

P. C. P.'s vigorous swatting netted them 7 bingles, each resulting in a tally, while their habit of getting in the way of the ball limited the N. Y. aggregation to 3 scores. The New Yorkers also had twice as many instances of cerated digits as the Phillies.

There will be a return game at Philadelphia, May 6th.

The Illinois supreme court has declared unconstitutional the section of the State medical practice act which required an itinerant medicine pedler to pay a license tax of \$100 a year. This ruling was based on an "equal rights" plea.

Chicago Association.

In his first report as president of the Chicago Retail Druggists' Association B. A. Hoelzer at a meeting held April 11th discussed the many problems in which his fellow-druggists were interested, touching upon legislative matters, commissions on "want ads," telegrams, etc., propagandic work, price protection, and the sale of narcotics among other things. This report was referred to the executive committee.

Secretary I. M. Light and Treasurer C. A. Storer reported a cash balance of \$1,245.66. The secretary's report also included an account of the good work being done by the collection department, the advertising committee, and the propaganda committee. The association is carrying an advertisement in one of the local newspapers, calling the attention of mothers to the value of the neighborhood drug store.

It was decided to accept an offer of 10 per cent. commission on telegrams sent in by telephone.

There was considerable discussion of ways and means of curtailing the privileges of itinerant venders of medicines. An attempt will be made to secure legislation for that purpose which will prove constitutional.

Price protection and the Miles decision aroused a deal of interest. A plan of protection that apparently would be legal and effective was outlined and recommended to the National Association of Retail Druggists.

Philadelphia Druggists as Minstrels.

Black-faced and grotesquely garbed the minstrel troupe of the Philadelphia Association of Retail Druggists enjoyed themselves and amused their fellow druggists April 18th, on the occasion of the annual gala night of the association. The passages of wit and humor had a pharmacal flavor that acted as a tonic to joke and jokee, and the fun-making thrusts at well-known men were hilariously received.

Some 500 persons attended the entertainment which, in addition to the minstrel show, included a musical concert by the association's mandolin club. Dancing completed the evening's enjoyable events.

Ohio Druggists and Doctors Dine.

One hundred and fifteen physicians of that city were the guests of the Columbus (Ohio) Retail Druggists' Association at a banquet April 5th.

Prof. John Uri Lloyd, of Cincinnati, was the speaker of the occasion, telling about "Ethical Preparations." H. W. Miller was toastmaster. The toasts included "The National Association of Retail Druggists," by T. H. Potts, of Chicago; "Get Together," by Dr. W. D. Deuschle, of Columbus; "The United States Pharmacopoeia," by Prof. J. H. Beal, of Scio, Ohio, and "The National Formulary Propaganda," by Dr. W. A. P. Andrews, of New York.

Satisfactory progress is being made in the work of establishing a medicinal plant garden at the College of Pharmacy of the University of Minnesota. The plans have been prepared by Prof. Newcomb, and the regents of the university have appropriated \$500 for the work. Prof. Clements of the botanical department of the university will co-operate with the pharmacal faculty in this matter, as he will have a garden of economic plants adjoining the drug-plant garden.

Ewen McIntyre, the oldest living graduate of the College of Pharmacy of the City of New York, Columbia University, and Mrs. McIntyre, had been married sixty years April 30th. They have a large family, one of the sons, Ewen, Jr., conducting at 992 Sixth avenue, corner of Fifty-sixth street, the drug business established by his father at Broadway and Eighteenth street sixty-four years ago.

Three hundred members of the Kansas City (Mo.) Retail Druggists' Association attended the annual banquet of the association March 22d. According to the local press the poor drug men were not permitted surcease of woes even on this gala occasion, the lay guests embracing every opportunity to "heckle" the downtrodden pill-rollers. But it was all good-natured joshing.

A Wisconsin druggist has been mulcted for damages amounting to \$150 in a suit brought by a farmer to whom the druggist had sold "blue ointment" to be used on animals as a parasiticide. The farmer lost several cows from mercurial poisoning.

Druggists and the Liquor Laws.

An internal revenue agent at Miami, Ohio, has received from the department a ruling that any retail merchants purchasing small quantities of alcoholic liquors for the accommodation of customers and at the request of the latter, even when no profit is charged in the transaction, are liable to a tax as retail liquor dealers. This would apply in the case of a druggist sending out for the whisky specified in some of the recent newspaper "prescriptions."

In Colorado a physician owner of a drug store has been fined \$25 for dispensing whisky on prescriptions written by himself.

The police officials of Bellingham, Wash., are endeavoring to get a court decision as to the right of a physician-druggist to dispense liquors on his own prescriptions.

At New Castle, Ind., the prosecuting attorney has concluded that the State "blind-tiger" law cannot be invoked in proceedings against druggists charged with selling liquors illicitly. The governor of Indiana has advised the board of pharmacy that it may revoke the license of any druggist selling intoxicating liquors contrary to law.

An Iowa druggist has been convicted and sentenced on a charge of violating the liquor law by selling a "bitters" nostrum.

Federal Positions Open.

May 24th the United States civil service commission will conduct an examination to secure eligibles for several positions as *assistant* in the paper and textile laboratories of the bureau of standards, at salaries ranging from \$900 to \$1,600 a year. Persons of technical experience and education are wanted. The candidates will be examined in general physics and chemistry and practical paper technology or textile technology. Applicants are required to be between the ages of twenty and thirty-five years.

On the same date the commission will conduct an examination to secure eligibles for the position of *assistant chemical engineer* in forest products in the forest service at Madison, Wis. This position pays from \$1,200 to \$1,500 a year and is open to men only who are more than twenty years old and not yet fifty and who have had practical training for the position. The examination will embrace the subjects of chemical arithmetic, engineering, and chemistry of forest products.

Rikers Fight Change in United Drug Co.

At a recent meeting of the United Drug Company it was decided to transfer the stock and holdings of the company, which is a New Jersey corporation, to Massachusetts. It was planned to bring about this action early in the past month. This plan did not meet with the approval of the William B. Riker & Son Company, which owns 120 shares of United stock, and the Riker company sought a restraining order from the New Jersey courts.

Arguments on the Riker petition were heard by Vice-Chancellor Emery, who granted an injunction to hold for two weeks, during which time the various points in controversy will be considered.

May Meetings of State Associations.

ALABAMA, 16th to 18th, at Birmingham.
 ARKANSAS, 9th to 11th, at Little Rock.
 CALIFORNIA, 16th to 19th, at Sacramento.
 IDAHO, 10th and 11th, at Twin Falls.
 KANSAS, 24th to 26th, at Topeka.
 LOUISIANA, 10th to 12th, at New Orleans.
 OKLAHOMA, 16th to 18th, at McAlester.

E. F. Kelly, of Baltimore, Md., the secretary of the Maryland Pharmaceutical Association and of the Baltimore branch of the American Pharmaceutical Association, has resigned from the superintendency of the laboratories of Sharp & Dohme.

Howard B. French, president of the Philadelphia College of Pharmacy, was the guest of honor at a banquet April 4th, on which occasion a life-size portrait of Mr. French was presented to the college by the alumni.

Albany, N. Y., now has an ordinance requiring that druggists selling phenol shall, in addition to labeling the container carefully, make a record of the sale including the names of the seller and the purchaser.

Two Good Ones.

Here we have two men entitled to more than mere passing notice, as each has done and is doing good work in his own line. If pharmacy and medicine had more such men progress in the two professions would be more rapid.

Dr. George H. Simmons.

If all men are loved, as some have been, for the enemies they have made, Dr. George H. Simmons is surely one of the much beloved, for he has thrown more bombshells and bigger bombshells into the camp of the more-or-less-respectable-appearing medical fakers than any other one man. And when he has been asked for his photograph for publication he has always met the request with a pleasant but firm No. The likeness of him we are showing herewith is

DR. G. H. SIMMONS.

E. C. GOETTING.

enlarged from a group taken of the trustees of the United States Pharmacopoeial Convention, of which body he became a member November 17th, 1909, succeeding S. A. D. Sheppard, who resigned a year previously.

Dr. Simmons was born in England, January 2d, 1853, and came to the United States when he was seventeen years of age. He studied at Tobar College, Iowa, at the University of Nebraska, at the Hahnemann Medical College, and at Rush Medical College. His diplomas from the latter two Chicago institutions are dated 1882 and 1892 respectively. He has done much post-graduate work in this country and in Europe, and has a long string of honorary titles. He was secretary of his State (Nebraska) association before he became the secretary of the American Medical Association and the editor of its *Journal* in 1899. In this latter position he has wielded a tremendous influence. His work in reorganizing and building up the association has been most effective, and as head of the association's council on pharmacy and chemistry he has accomplished much in the direction of ridding both physicians and pharmacists of the fakers who, like the Old Man of the Sea, had ridden them nearly to death.

Ernest C. Goetting.

Ernest C. Goetting, the happy bachelor druggist for long identified with the northwest corner of Amsterdam avenue and One Hundredth street, this city, has sold his store there and intends to take a little vacation, some of which will be spent in Hanover, Germany, where he was born in 1849. Mr. Goetting adopted America as his home in 1876, having previously equipped himself for his career as an apotheker in the thorough manner in vogue in the Fatherland. Arriving at New York the young man soon found a job at Herman Paepke's store, Sixth avenue and Fourteenth street, which he succeeded in holding down while he was becoming acquainted with the ways of this country. He learned his lesson so well that he soon was able to assume the managership of the store of his uncle, George Goetting, at Sixth avenue and Forty-first street. This store he bought in 1879. An even dozen years he ran this place, and then sold it in 1891. Soon afterward he located at the Amsterdam avenue corner with which he has been identified for a score of years.

Not only is Mr. Goetting a recognized authority on pharmaceutical matters, but a facile writer on them as well, and he is one of those busy men who finds time for much

work outside of his store. In the affairs of the New York German Apothecaries' Society he has long been prominent, and in 1887 to 1889 served that society as its president. He is also a member of the Old German Students' Society of New York, the German Hospital Society, and the Masonic fraternity.

Pharmacy in the Philippines.*

Now that the Philippine Medical School is thoroughly established and is well under way in offering scientific instruction to its students, and the medical department of Santo Tomas University has shown signs of improvement, it has been thought well to take up the question of the Filipino pharmacist. The question of his efficiency and the local facilities for training pharmacists has been studied with a view of recommending necessary improvements in the existing courses in the three Manila schools of pharmacy, as well as looking toward the establishment of a school of pharmacy in connection with the Philippine Medical School and the University of the Philippines.

In the Philippines, pharmacy is considered one of the learned professions; the pharmacist is in rank next to the physician, and, like the latter, has too often proved ill trained for many of the simple duties of his trade. In many of the towns of the provinces he forms an important factor in the social scale and has sometimes engaged in politics.

In Manila there are good pharmacies, but with very few exceptions the provinces are without efficient or competent pharmacists. The training in the local schools of pharmacy is based on the Spanish system and is not in accord with the modern European methods. Thus we are facing the necessity of having the prescriptions of American and American-trained physicians sent to Manila to be filled. These prescriptions are sometimes written by Manila physicians, sent to the provinces and then returned to Manila to be filled. This state of affairs almost compels the graduates of the Philippine Medical School to be their own pharmacists in the provinces. Such a condition hampers the work of the bureau of health and will defeat many of the efforts of modern medical education in the Islands until improvement is brought about.

With the possible exception of one school—the school of pharmacy of Santo Tomas University—the institutions in Manila are in nowise prepared to train competent pharmacists. Even the graduates of the Santo Tomas school have great difficulty in passing the examinations of the board of pharmaceutical examiners, and radical changes must be made in this school to make it an efficient institution.

In July, 1909, twenty-three candidates entered the examinations of the board of pharmaceutical examiners. Only one passed. At the 1910 examination, twenty-six candidates were entered; not a single candidate passed. The highest grade given was 53 per cent.

The legal requirements are not to be considered drastic. They were made to suit the conditions of the country and are just as liberal as is compatible with public safety in the matters of fairly well-trained pharmacists. Any student who has had a moderately good training in pharmacy should have no trouble in passing the examinations.

If the educational facilities for training pharmacists are not soon improved it will probably be necessary to relax the legal requirements somewhat, otherwise the drug business will be monopolized by a small number of pharmacists. The Filipino is quick to take advantage and is decidedly mercenary when he controls the situation. For this reason it is not advisable to enforce rigidly the regulations covering the practice of midwifery in these islands. It was found in Manila that the few competent midwives would quickly run up their charges to exorbitant rates when the ban was put on their less capable sisters in the profession. The Filipino pharmacist, as well as the Filipino physician, usually regulates his charges by the necessity for his services in a particular case. In an emergency he is often a robber. As an example: one of the medical health officers had occasion to require immediately 2 liters of saline solution in an emergency case. He dispatched a messenger to the local *botica* (drug store) on a hurry-up call for the solution. The bill presented for the 2 liters was 16 pesos (\$8).

John G. Cole, of Cohoes, N. Y., has been appointed postmaster at that office.

*From a regular correspondent in the *Journal of the American Medical Association*.

News of the Pharmacy Boards.

List of Board Secretaries.

In the following list are to be found the names and addresses of the secretaries of the various boards of pharmacy of the country. When the date and place of the next meeting of a board are known they are given also.

Secretaries are requested to keep us informed as to dates and places.

ALABAMA—May 15th, at Birmingham. E. P. Galt, Selma.
 ARIZONA—November 8th, at Phoenix. A. G. Hulett, Phoenix.
 ARKANSAS—May 8th, at Little Rock. J. F. Dowdy, Little Rock.
 CALIFORNIA—Louis Zeh, San Francisco.
 COLORADO—June 10th and 11th, at Denver. S. L. Bresler, Denver.
 CONNECTICUT—June 6th, at Hartford. J. A. Levery, Bridgeport.
 DELAWARE—Albert Dougherty, Wilmington.
 DISTRICT OF COLUMBIA—July 13th and 14th, at Washington. S. L. Hilton, Washington.
 FLORIDA—June 12th and 13th, at Tampa. D. W. Ramsaur, Palatka.
 GEORGIA—C. D. Jordan, Monticello.
 IDAHO—J. M. Starrh, Shoshone.
 ILLINOIS—F. C. Dodds, Springfield.
 INDIANA—July 11th and 12th, at Indianapolis. W. H. Rud-der, Salem.
 IOWA—June 6th, at Des Moines. E. J. Moore, Des Moines.
 KANSAS—May 25th, at Topeka. W. E. Sherriff, Ellsworth.
 KENTUCKY—J. W. Gayle, Frankfort.
 LOUISIANA—May 9th to 11th, at New Orleans. F. A. Earhart, New Orleans.
 MAINE—June 14th and 15th, at Augusta. F. W. Bucknam, Skowhegan.
 MARYLAND—Ephraim Bacon, Roland Park.
 MASSACHUSETTS—Every Tuesday between September 1st and July 1st, at Boston. P. J. McCormick, Boston.
 MICHIGAN—E. J. Rodgers, Port Huron.
 MINNESOTA—July 18th, at Minneapolis. C. T. Heller, St. Paul.
 MISSISSIPPI—October 3d, at Jackson. L. H. Wilkinson, Greenwood.
 MISSOURI—June 12th, at Cape Girardeau. C. E. Zinn, Kansas City.
 MONTANA—T. M. Kehoe, Billings.
 NEBRASKA—A. V. Pease, Fairbury.
 NEVADA—May 3d, at Reno. R. L. Prouty, Tonopah.
 NEW HAMPSHIRE—May 24th, at Concord. F. H. Wingate, Nashua.
 NEW JERSEY—July 20th and 21st, at Trenton. H. A. Jordan, Bridgeton.
 NEW MEXICO—A. J. Fisher, Santa Fe.
 NEW YORK—May 24th and 25th, at New York, Albany and Buffalo. W. L. Bradt, Albany.
 NORTH CAROLINA—July 7th, at Morehead City. F. W. Hancock, Oxford.
 NORTH DAKOTA—June 20th, at Fargo. W. S. Parker, Lisbon.
 OHIO—June 20th to 23d, at Columbus. F. H. Frost, Columbus.
 OKLAHOMA—J. C. Burton, Stroud.
 OREGON—June 6th and 7th, at Portland. F. C. Pozzi, Portland.
 PENNSYLVANIA—June 8th and 9th, at Pittsburg and Philadelphia. L. L. Walton, Williamsport.
 RHODE ISLAND—June 6th, at Providence. J. E. Brennan, Pawtucket.
 SOUTH CAROLINA—July 3d and 4th, at Greenville. F. M. Smith, Charleston.
 SOUTH DAKOTA—July 12th, at Lead. E. C. Bent, Dell Rapids.
 TENNESSEE—I. B. Clark, Nashville.
 TEXAS—May 16th, at San Antonio. R. H. Walker, Gonzales.
 UTAH—July 18th and 19th, at Salt Lake City. W. H. Dayton, Salt Lake.
 VERMONT—D. F. Davis, Barre.
 VIRGINIA—July 25th, at Richmond. T. A. Miller, Richmond.
 WASHINGTON—P. Jensen, Tacoma.
 WEST VIRGINIA—May 5th and 6th, at Wheeling. A. Walker, Sutton.
 WISCONSIN—Edward Williams, Madison.
 WYOMING—C. B. Gunnell, Evanston.

California Board.

Several arrests have followed an investigation by the inspectors of the California Board of Pharmacy as to the extent to which the pharmacy law was being complied with. It is reported that five druggists in small towns in one county plead guilty to having left their stores in charge of unlicensed persons. Each was fined \$20.

Colorado Board.

There were fifty applicants for registration examined by the Colorado Board of Pharmacy at the meeting held March 17th and 18th, at Denver. Only thirteen of these were successful; they are:

C. R. DePue, N. H. Lenz, G. F. Metzger, William Oberhausen, C. E. Spahn, R. A. White, and Louis Zackheim, all of Denver; W. J. Bishop, of Grand Junction; J. R. Blackstick, of Gunnison; L. W. Critz, of Colorado Springs; R. S. Gordan, of Edgewater; Henry Hidderson, of Langmont; and C. L. Kendeigh, of Grand Junction.

The next meeting of the board will be held at Denver, June 10th.

Newspaper accounts have it that the board is interested in a project to establish a school of pharmacy at Denver.

Connecticut Board.

Twenty-two of thirty-eight applicants for registration passed the examination of the Connecticut Board of Pharmacy at the meeting held March 7th, at Hartford.

C. H. W. Newton, of Waterbury, has been appointed a member of the board. Governor Baldwin is reported to have said that the fact that Mr. Newton was a British subject, he not having completed his application for naturalization, in no way affected his qualifying for the office to which he was appointed.

District of Columbia Board.

Of the ten applicants for registration examined at the meeting of the District of Columbia Board of Pharmacy held April 13th and 14th, the following three were successful:

N. S. Avinger, Joseph Lear, and W. F. Passer.

The next meeting of the board will be held July 13th and 14th.

The board is endeavoring to prohibit the selling of narcotic and poisonous drugs by dental supply houses except under the personal supervision of a registered pharmacist.

Illinois Board.

An opinion of Attorney-General Stead of Illinois in the matter of expenditure of moneys collected by the State board of game commissioners is in effect that such expenditure is illegal, that all fees, fines, etc., collected by any board must be turned into the State treasury and no expenditures shall be made by the board except by means of money appropriated by the legislature for the purpose. This opinion affects the board of pharmacy, and in common with other State bodies the board is being handicapped in its work.

Because of an overabundance of other duties C. H. Avery, of Chicago, has tendered to the governor his resignation as a member of the board.

Iowa Board.

At the February meeting of the Iowa Board of Pharmacy sixty-eight applicants for registration were examined; the following twenty-three were successful:

J. J. Gillespie, H. H. Nabens, C. A. Palmer, W. H. Ringen, L. L. Smith, W. W. Smith, and J. H. Willett, all of Des Moines; G. J. Carter, of Waukon; Fay Ellis, of Sioux City; Jerome Huber, of Cylinder; R. J. Mallory, of Williams; Harry Miller, of Brayton; A. J. Nelson, of Burlington; W. H. Paustion, of Holstein; J. F. Reinhold, of Manning; F. C. Ribison, of Anita; R. E. Roney, of Decorah; H. E. Rousch, of Tingley; H. B. Scotchorn, of Lamont; A. H. Stephan, of Davenport; O. F. Trumbo, of Osceola; F. R. White, of Akron; and M. J. Wilkinson, of Marengo.

The next meeting of the board will be held at Des Moines, June 6th.

Massachusetts Board.

During the month of March the Massachusetts Board of Pharmacy held examinations on the 7th, 14th and 21st; in all fifty-two applicants for registration were examined, the following twenty-six passing:

As pharmacists—Charles Brown, of Roxbury; F. H. Coolbroth, of Springfield; W. J. Cullinan, of Lowell; Vera G. Fox, of Newton; E. W. Hackett, of Salem; William Linahan, of Watertown; J. F. McMahon, of Brookline; T. J. Mullarkey, of Haverhill; Charles Pomponio, of Waverley; H. I. Quennell, of Somerville; G. A. Rivers, of New Bedford; and H. J. Simmers, of Springfield.

As assistants—E. W. Blight, of Pittsfield; Auguste Boas, of Fall River; W. A. Boughner, of Dorchester; F. T. Buckley, of Roxbury; Robert Cowan, of Boston; A. E. Flathers, of Methuen; J. A. Gallant, of New Bedford; G. N. Gilbert, of Pittsfield; F. W. Kowenda and J. A. La Fontaine, both of Somerville; H. D. Leighton, of Lowell; R. P. L. Nadeau, of Fall River; R. A. Peckham, of Worcester; and A. J. Sands, of Amesbury.

Mississippi Board.

At the meeting of the Mississippi Board of Pharmacy held April 4th, at Jackson the board examined sixty-four applicants for registration, of whom the following thirty-five were successful:

C. C. Allen, of University; E. F. Barnes, of Oak Ridge; Charles Bradford, of Hattiesburg; Glenn Bright, of University; D. C. Burch and G. W. Clark, both of Verona; J. R. Cooper, of Pachuta; E. M. Davis, of Purvis; J. F. Dixon, of Natchez; W. T. Ellis, of Greenville; C. V. Gibson, of Grenada; Jay Gore, of Coffeeville; W. C. Harrison, of Vicksburg; A. J. Hemphill, of McCool; E. B. Holbrook, of Jackson; C. W. Holcomb, of Phenix; W. E. Holcomb, of Magnolia; B. F. Huck, of Independence, La.; Hunter Huddle, of Alexander, La.; O. E. Jordan, of Poplarville; Georgia Knight, of Potosi; R. H. Lewis, of Gulfport; H. J. McMillan, of Hickory; C. G. Mansfield, of Bentonla; S. T. Moore, of Meridian; H. L. Morgan, of Canton; H. V. Mortimer, of Greenwood; L. E. Pennington, of Decatur; A. M. Redmond, of Jackson; G. W. Staples, of Meridian; E. J. Stockstill, of Picayune; D. V. Stuart, of Centerville; J. E. Thomas, of Eupora; H. M. Todd, of Jackson; and J. B. Walton, of Lexington.

The next meeting of the board will be held at Jackson, October 3d.

Missouri Board.

At the March meeting of the Missouri Board of Pharmacy the following applicants for registration were successful:

As pharmacists—I. R. Aber, Christo Abramopoulos, A. C. Ayers, W. M. Bodine, J. L. Dye, G. E. Egly, G. H. Emick, R. A. Glidewell, H. B. Hedrick, J. R. Hodges, Raymond Jakobe, L. A. Jamison, C. E. Kirschner, H. E. Martin, G. I. Nugent, Joseph Ostle, J. B. Ricedorff, C. R. Rostine, M. M. Russell, L. J. Seymour, F. E. Soulier, Izzzy Stevens, Anthony Tripi, R. E. Walker, H. C. White, Sister Lucien Woodlock, A. D. Woods, and C. C. Worley, all of Kansas City; J. A. Aldred, of Kansas City, Kan.; J. F. Anderson, of Coffeyville, Kan.; J. H. Anderson, of Hannibal; J. D. Boyles, of Brookfield; T. C. Brown, of Chillicothe; W. J. Cecil, of Windsor; T. F. Clark, of Weston; A. M. Colley, of Rothville; A. E. Crain, of Trenton; F. M. Davis, of Galatin; H. V. De Goler, of Kansas City, Kan.; J. J. De Vereaux, of St. Louis; L. E. Dotson, of Marshall; J. W. Edelin, of Trenton; Mina Enix, of Vinita, Okla.; Arthur Geyer, of Herington, Kan.; W. S. Harris, of Sturgeon; W. P. Henry, of Plattsburg; W. H. Harron, of Lansing, Kan.; J. B. Hopper, of Columbia; J. A. Hunter, of Carrollton; E. B. Iden, of Smithville; C. F. Johnson, of Buffalo; D. R. King, of Gallatin; A. E. Michie, of Webb City; Hazel P. Morgan, of Deepwater; W. D. Muir, of Windsor; Walter Myren, of Des Moines, Ia.; J. Q. Page, of Central City, Ia.; E. C. Phillips, of Oregon; C. R. Pike, of Willard; L. R. Rice, of Lexington; S. A. Roach, of Barnard; Ora F. Roberts, of Wyaconda; H. I. Sears, of La Plata; G. L. Shortridge, of Pleasant Hill; J. B. Stapleton and DeW. C. Thompson, both of Plattsburg; C. W. Vantrees, of Butler; C. J. Walker and A. J. Warner, both of Hannibal; G. W. Watkins, of Laddonia; and O. L. Yancey, of Hunnewell.

As assistants—H. C. Brockhouse, of Peculiar; A. M. Capland, of Kansas City, Mo.; J. A. Crook, of Des Moines, Ia.; D. R. Galbreath, of Clark; L. E. Gardner, of Kansas City; E. C. Gerding, of St. Joseph; E. G. Gratiquy, of Kansas City, Kan.; R. E. Hayes, of St. Joseph; W. E. Hurst, of Gentry; K. K. Kane, of Carthage; W. M. McCauley, of Doniphan; W. R. Meador, of Belton; and J. C. Shuff, of Pickering.

The next meeting of the board will be held June 12th at Cape Girardeau.

New Hampshire Board.

Seven applicants for registration were examined by the New Hampshire Board of Pharmacy at the meeting held March 22d, at Nashua. Only one, F. H. Whiting, of Greenville, was successful.

The next meeting of the board will be held May 24th, at Concord.

New York Board.

The first examination conducted by the New York Board of Pharmacy established by the law of 1910 was held February 1st and 2d, at Albany, Buffalo, and this city. Seventy applicants for registration appeared, more than half of whom sought licenses as pharmacists. Fifteen of the latter were successful, and twenty-one passed the examination for druggists' license. The successful ones are:

As pharmacists—Isidor Berkowitz, Samuel Blatt, J. H. Clarke, Abraham Cohen, J. J. Depuy, Jacob Etler, Elvira Kalkbrenner, Isidore Kapolsky, Paul Rademacher, C. M. Roes, Harris Schlesinger, Deboro Spero, and Max Turnerman, all at this city; L. R. Cornell, at Buffalo; and S. E. Shanks, at Albany.

As druggists—J. R. A. Balje, J. H. Hayes, F. W. Isles, H. W. Maybee, D. H. Norton, C. E. Ostrander, P. M. J. Ryan, F. Salvione, H. W. Van Loan, and C. G. Watson, all at Albany; A. H. Coling, J. J. Courneen, R. H. Dutcher, R. W. Englehardt, L. H. Guard, O. A. Krampf, F. B. Malecki, R. E. Moore, T. W. Sullivan, and P. A. Weinstein, all at Buffalo; and Harold Westervelt, at this city.

The next examination by the board will be held May 24th and 25th, at Albany, Buffalo, and this city.

North Dakota Board.

At the meeting of the North Dakota Board of Pharmacy held March 21st to 23d, at Fargo, seventy applicants for registration were examined. The successful numbered forty-six, being the following:

As pharmacists—Arthur Anderson, of Grand Forks; Otto Anderson, of Manfred; S. M. Bennett, of Drake; Leslie Benno, of Minot; F. J. Berghan, of Lisbon; W. F. Crowley, of Devil's Lake; W. A. Erickson, of Fargo; W. F. Fuerstnow, of Tioga; H. L. Halverson, of Des Lacs; J. S. Kelly, of Grafton; F. M. Leland, of Fargo; M. C. Logan, of Hancock, Minn.; A. C. McInnes, of Devil's Lake; D. J. McNeil, of Milton; C. J. McWold, of Richardton; A. E. Madsen, of Rugby; G. P. Manning, of Hansboro; A. M. Neander, of Berthold; P. C. Pederson, of Hawley, Minn.; J. H. Peterson, of Des Lacs; W. H. Schram, of Herman, Minn.; Ingwold Simmons, of Fargo; H. L. Svienson, of Hamilton; S. F. Thompson, of Flaxton; C. P. Thomson, of Minto; and F. J. Warner, of Esmond.

As assistants—J. M. Asal, of Fargo; R. R. Barry, of Ambrose; A. M. Carvell, of Max; Harold Connelley, of Devil's Lake; O. M. Ellingson, of Cando; Nan Frazier, of Tower City; W. S. Johnson, of Crystal; E. C. Jorgen, of Rostray, Minn.; C. B. McDonald, of Grafton; Florence McDowell, of Palermo; J. E. Martin, of Fargo; Gerden Montgomery, of Inkster; G. R. Nelson, of Fargo; C. R. Odney, of Hatton; G. E. Rackow, of Hankinson; W. B. Smith, of Dickinson; O. B. Syurseth, of Lakota; John Whalen, of Yorke; William Wistrom, of Burlington; and C. L. Worsley, of Hansboro.

The next meeting of the board will be held June 20th, at Fargo.

Ohio Board.

In a letter recently sent to several grocery firms Secretary F. H. Frost of the Ohio Board of Pharmacy advised the grocers that the board considered the sale of solution of hydrogen dioxide by others than licensed pharmacists to be contrary to the State pharmacy law. It is the stated intention of the board to enforce the law in this connection, in accordance with the Secretary's interpretation.

Oregon Board.

An annual meeting of the Oregon Board of Pharmacy was held at Salem, March 14th and 15th. During this meeting fifty-five applicants for registration were examined, of whom the following thirty-nine were successful:

As pharmacists—W. P. Hood, C. V. Johnson, C. C. Kelly, O. K. Laue, E. H. Mercer, W. A. Norby, W. S. Redfield, F. O. Rose, and L. E. Wray, all of Portland; L. F. Allen, of Wallawa; G. H. Blackman, of Junction City; W. R. Bunn, of Yamhill; E. B. Cochrane, of Baker; H. W. Crow, of Guyman, Okla.; F. G. Evenden, of Astoria; A. N. Fischer, and

Paul Geisler, both of Lents; J. A. Goodner, of Walford, N. D.; W. E. Grosshogg, of Centralia, Wash.; R. B. Hamilton, of Baker City; J. P. Hanley, of Vancouver, Wash.; F. J. Harris, of Pendleton; W. D. McCurry, of Union; A. E. Menizer, of Mitchell, S. D.; E. A. Schafer, of Astoria; and G. A. Wilson, of Scappoose.

As assistants—Louis Bauer, A. J. Custer, Henry Handahl, W. S. Hopkins, W. R. Monroe, Ralph Nichols, Erick Radke, Stuart Stayner, and M. M. Williams, all of Portland; Harry Hart, of Cottage Grove; Eugene Levy, of Montavilla; H. H. Mack, of Huntington; and L. M. Nelson, of Gross Valley.

The next meeting of the board will be held June 6th and 7th, at Portland.

At the March meeting the following officers were elected: President, Miss Kittie W. Harbord, of Salem; treasurer, F. H. Caldwell, of Newberg; and secretary, F. C. Pozzi, of Portland.

South Carolina Board.

At the meeting of the South Carolina Board held March 15th, at Charleston, sixteen applicants for registration were examined. The five who were successful are:

A. W. Cherry, of Orangeburg; C. R. Cowan, of Rock Hill; L. G. Day, of Lexington; S. O. Floyd, of Charleston; and W. C. McManus, of Chesterfield.

The next meeting of the board will be held July 3d and 4th, at Greenville.

Popularizing an Insect Powder.*

The savage ancestry of man can seldom be appealed to in advertising, but the public demonstration of the effectiveness of an insect exterminator drew crowds, interested them, convinced them—and made the originator of the scheme wealthy.

A druggist in the rural district of Michigan originated and manufactured an insect powder, but after advertising it in the local territory he found that his customers placed no confidence in his powder and often bought inferior quality in preference to his own make.

To stimulate an interest in this powder he gathered numerous insects of every description and displayed them in glass jars in his show window.

Then he began a new advertising campaign, calling special attention to the insects in his show windows and advertising every afternoon a glass jar filled with insects would be opened and the vermin killed by his powder. Not a very inviting attraction, you say? Possibly not, but every afternoon for a month the walk in front of the store was crowded to watch the performance.

This demonstration created a universal interest, the local papers advertised it, the metropolis dailies told of the unique advertising campaign, and in a short time there was such a demand for the insect powder that every druggist in the county was retailing it. Then the inquiries from wholesale houses began to come in, and in a year the druggist sold his store to devote his entire time to the manufacture of his insect powder.

A French court has lately allowed a claim for \$800 damages against a pharmacist who, having been consulted by a domestic servant relative to the treatment necessary for a bruised shoulder, supplied a lotion and volunteered the information that the attention of a physician was not needed. The injury proved to be a dislocation later requiring the services of a surgeon because proper treatment had been delayed.

The Louisiana Board of Health has declared its intention of rigidly enforcing the pure drugs law. Samples of drugs and preparations are being collected and analyzed, and several prosecutions have been started.

Prof. Alexander Smith, director of the chemical laboratories of the University of Chicago, has been appointed professor of chemistry at Columbia University to succeed Dr. C. T. Chandler.

Prof. Virgil Coblenz has resigned from the chair of general chemistry at Columbia University and his professorship at the College of Pharmacy of the City of New York.

Prof. C. L. Pickel has resigned as instructor in pharmacy at the Ferris Institute, Big Rapids, Mich. E. J. Parr, of Detroit, is his successor.

Obituaries.

ALBERT B. BALTZLY.

Albert Bates Baltzly, one of the most successful druggists of the upper west side of New York, was found dead in his store at Broadway and Ninety-sixth street by one of his clerks who opened the place on the morning of April 19th. His death was due to heart disease. He had remained in the store after the clerks had locked up the previous night, for the purpose of looking over his bills.

Mr. Baltzly was born near Massillon, Ohio, fifty years ago, and entered the drug business as a boy in the store of Grossklaus & Ricksecker, of Navarre, that State. He had been in business in this city many years. Before opening the Broadway store ten years ago he had a store in Harlem, but had disposed of that when the Broadway business grew so that it required all his attention. He was prominent in association matters, and with his wife was a regular attendant at the meetings of the National Association of Retail Druggists and the New York State Pharmaceutical Association. He was one of the leading men in local N. A. R. D. circles, having been treasurer of the branch in this city. At one time he was president of the Hudson River Pharmaceutical Association, and upper west side organization of this city, and was a member of the American Pharmaceutical Association. He leaves a wife and daughter.

J. K. WILLIAMS.

Capt. John Kirby Williams, of Hartford, Conn., died April 18th, aged seventy-three years. He was born at Cromwell, Conn., and received his early education at the academy in his native town. He became an apprentice in pharmacy at Hartford in 1853, and clerked until 1862, when he entered the Union army as a lieutenant of volunteers. In 1870 he went into business and played a prominent part in commercial affairs of his city and State ever since. He was for a long time the legislative representative of the pharmacists of the State and was largely instrumental in forming the pharmacy statutes. Capt. Williams was prominent in civic affairs, particularly those having to do with education. He is survived by a son and a daughter.

J. B. WEBB.

James B. Webb, of DeWitt, Ia., who retired from business a few months ago, died April 12th, at the age of seventy-one years. He was a native of New York State, but was one of the first druggists licensed in Iowa, having passed fifty-one years in the same store at DeWitt. He was the treasurer of the Iowa Pharmaceutical Association for the past twenty-three years. His wife and two children survive him.

W. A. SPALDING.

Warren Alphonso Spalding, of New Haven, Conn., formerly lecturer and instructor in pharmacy at the Yale medical school, died April 14th, aged sixty-six years. He was a native of Vermont; an active member of the American Pharmaceutical Association and Connecticut Pharmaceutical Association, and the president of the National Tradesmen's Bank. He leaves three sons and two daughters.

B. G. AMEND.

Bernard G. Amend, president of the firm of Eimer & Amend, of this city, died April 6th, at the age of ninety years. He was born at Darmstadt, Germany, and came to this country in 1847, clerking in a retail store in this city, which he later purchased. Mr. Amend was a man of considerable means and a member of several educational and philanthropic organizations of this city.

JOHN GERTLER.

John Gertler, of the firm of Gertler, Wall & Gertler, of Indianapolis, Ind., was killed in an automobile accident March 25th. He was the dean of the National Trade School and Technical Institute.

Following are recently reported deaths of other persons in the pharmaceutical world:

CHARLES B. ALLEN, of Patton's drug store, York, Pa., April 3d, aged sixty-seven years.

HERMAN BARTEL, of this city, April 8th.

JOSEPH F. BAUMEISTER, a thirty-third degree Mason, of Scranton, Pa., March 23d, aged forty-nine years.

MORTIMER H. BICKLEY, at Wilmington, Del., April 2d, aged eighty years.

J. C. BORCHARDT, of Chicago, aged seventy-one years.

J. P. BUFFINGTON, of Defiance, O., March 30th, aged eighty-three years.

W. F. DAVIS, of Lebanon, N. H., March 9th, aged seventy years.

JAMES DOYLE, of Constableville, N. Y., an old-time apothecary.

HOWARD CLARKE FAY, of Turner's drug store, Altoona, Pa., March 25th, aged thirty-two years.

B. E. FISH, of Chappell, Neb., March 21st, aged forty-seven years. He left an estate valued at \$100,000.

Dr. A. R. GRAY, of Jenkinstown, Pa., aged seventy-nine years.

JOHN F. GROSSKLAUS, of Navarre, O., formerly of the firm of Grossklaus & Ricksecker, and preceptor of the late A. B. Baltzly, of this city, at Navarre, March 16th, aged eighty-five years.

GEORGE C. HAMAN, of Cedar Rapids, Ia., March 19th, aged seventy-three years.

ERNEST C. B. HARTUNG, of Pittsburg, Pa., March 29th, aged fifty years.

A. E. HORN, of Oshkosh, Wis., March 21st, aged forty-nine years.

Dr. JONATHAN A. C. HOWER, of Martinsburg, W. Va., March 28th, aged eighty-four years.

GEORGE W. HULL, of Lancaster, Pa., March 4th, aged sixty-eight years.

ROBERT S. JENKINSON, of Rockingham, N. C., April 2d, aged forty years.

JOSHUA A. LOOMIS, of Easthampton, Mass., a Civil War veteran, and Knight Templar, March 31st, aged seventy-three years.

JAMES J. MARRIN, of Holyoke, Mass.

CHESTER R. MILLER, of Lawrenceburg, Ind., aged forty-one years.

GEORGE P. MULHALL, of St. Louis, Mo., March 14th.

THOMAS M. NEWBOLD, of Philadelphia, Pa., April 2d, aged sixty-seven years.

GEORGE FITCH PARSONS, of Troy, N. Y., a prominent member of several fraternal organizations, April 4th, aged sixty-three years.

THOMAS B. PENTON, Chicago veteran druggist, at New Rochelle, N. Y., April 21st.

DAVID H. POLLOCK, of Beloit, Wis., at Orlando, Fla., April 15th, aged fifty-one years.

ROBERT RADEMAKER, of Washington, D. C., April 5th, aged thirty-eight years.

C. D. RANKIN, of Charlottetown, P. E. I., April 5th, aged fifty-eight years.

FREDERICK T. ROBINSON, of Brooklyn, Md., at Baltimore, April 10th, aged forty-three years.

HENRY T. ROHLFING, of St. Louis, April 5th, aged seventy-three years.

HENRY H. SMITH, at Spencerport, N. Y., April 1st, aged forty-eight years.

WILLIAM H. TUCK, of Wilkes-Barre, Pa., March 21st, aged forty-nine years.

THOMAS I. WEBB, of Nashville, Tenn., March 24th, aged seventy-three years. He was secretary of Spurlock-Neal & Co.

GEORGE C. WEBSTER, of Indianapolis, Ind., March 29th, aged sixty-seven years.

GEORGE N. WILBER, of Poughkeepsie, N. Y., April 6th, aged sixty-nine years.
